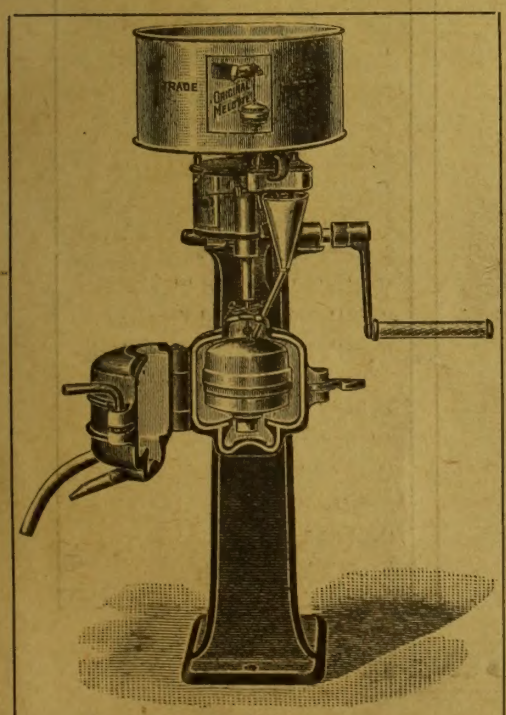
25 YEARS' USE

In the Dairies of Half a Million Customers
Demonstrates that

THE MELOTTE

is the MOST EFFICIENT, SERVICEABLE and PROFITABLE
CREAM SEPARATOR ever constructed



Cap. 280-720 lbs. per hour

The "Melotte" pays its original cost within 12 months from date of purchase in EXTRA CREAM alone and there is NO COST for repairs.

The "Melotte" skims more milk with LESS POWER in LESS TIME, and, under all conditions MORE EFFECTIVELY than other Cream Separators.

"MELOTTES" are ALWAYS READY to separate. Ask your neighbor to prove this statement.

If you want a Cream Separator, TRY A MELOTTE, then you'll buy it and be a SATISFIED USER.

It's a Time-Saver, Money-Earner, Satisfaction-Giver, all the year round

MELOTTES are all GUARANTEED to give entire satisfaction, and every machine can be operated before being purchased when in doubt.

Write for New Recommendation Booklet which is All Truth

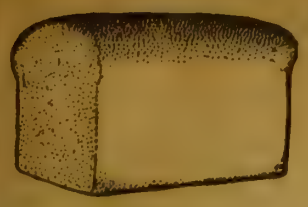
ASEPTO SOAPS Ltd., ST. JOHN, N.B.



Your money back if Purity Flour does not prove entirely satisfactory in the baking.

DON'T simply buy flour from the dollar and cent side of it. Buy high-quality flour. That means PURITY FLOUR. The first little extra cost is more than made up by the extra number of loaves of bread it makes—by the superiority of the bread and pastry in sweetness of flavor and nourishing qualities. Buying Purity Flour is a safe investment. You get large returns, not only on account of Purity's ability to produce more, but because Purity contains the greater nutriment and the vim of a strong hard wheat flour. Food made from Purity Flour gives the consumer health, snap and force, which cannot be gained from the use of the weaker soft wheat flour.

"MORE BREAD AND BETTER BREAD"

PURITY FLOUR

You can buy as little as a 7 pound cotton bag or in 14, 24, 49, and 98 pound sacks. Also in barrels and half-barrels

WESTERN CANADA FLOUR MILLS COMPANY — Purity — MANITOBA HARD WHEAT

Purity may cost a little more than some flours but you'll find its more than worth the difference. To be genuine, must bear the Purity trade mark.

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education—It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

AGRICULTURAL COLLEGE, TRURO, N. S.

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course Begins November 1st, 1911

Next Shourt Course for Farmers and Farmers' Sons Begins January 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies Begins January 2nd, 1912

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Seiences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practicé and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have not had an opportunity to acquire a high school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Argicultural Colleges. For full particulars apply to—

The Farm Labor Problem

The two great problems on the farm to-day are time and labor, especially at this time of year when you are gathering in your crops and preparing for the winter months. Wouldn't you welcome a machine that could work away all day, doing your tedious jobs, such as running a cream separator, threshing, cutting corn or pumping water and sawing wood. This is what a

FAIRBANKS-MORSE GASOLINE ENGINE

will do for you, being built for such service and has proved this to over 112,000 users, affording them cheap and reliable help at all times, and any season. Our engines for out-door work are made to run in the coldest day as well as the hottest. Take up your pencil and fill in the coupon and mail it to The Canadian Fairbanks-Morse Co., Limited, 444 St. James St. Montreal M

AND

CO-OPERATIVE DAIRYMAN

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association and the Maritime Bee-Keepers' Association.

Volume 17. ST. JOHN, NEW BRUNSWICK, OCTOBER 17, 1911. Number 1.

The Prince Edward Island Exhibition.

THE Provincial Exhibition of 1911 was ushered in unfavorably by the weather man, but in spite of this and continued wet the exhibits in many classes told an elegant story of proress.

The exhibition substantially illustrated the activities and thought of the Island farmers and they were not behind other seasons, although the dryness of the past summers accounted for a little slackness in the quality of exhibits.

THE OPENING EXERCISES.

The Fair was opened by His Honor Lieut.-Governor Rogers, the President, Justice Fitzgerald, making a number of optimistic remarks, and referring to the fox raising industry that was assuming such large proportions in the province.

Following His Honor, Professor Gussow, Dr. Andrew McPhail, Andrew Elliott and P. Farrell spoke on the educational features of the exhibition.

AGRICULTURAL HALL.

The greatest exhibit of field roots the Island Fair has seen for some time was displayed this year, with the quality fully up to the standard. Several superb collections of vegetables that were a credit to their respective exhibitors adorned one side of the building. Grains made a good showing, and we noted eleven bags of timothy that were a silent sign that the importation of timothy seed would cease in a not very distant future. The present price of this seed is making this crop a very profitable one.

FRUIT EXHIBIT.

The entries in fruit were particularly heavy and as the quality was so very even, and plates so numerous, the Judge, Mr. R. W. Starr, had a busy time.

DAIRY AND POULTRY.

The dairy products were here in full force. The large numbers of entries were made, especially in the farm dairy class, brought out no doubt by the large and special prizes given. The poultry building was well filled with a very creditable display of the standard varieties.

Artis-Jake.

Champion Holstein Bull at the 1911 Halifax Exhibition, Bred, owned and exhibited by Logan Bros., Amherst, N. S.

ART GALLERY.

The methods of arrangement, and display in the Art gallery were a decided improvement on former years. The West Kent Training School Exhibit deserves great praise, as also does the efforts of the Hillsboro Consolidated school. There was nothing remarkable about the Art exhibit, but in many of them there was taste and the promise of future excellence.

EDUCATIONAL AND EXPERIMENTAL WORK.

The exhibit of the new Island Experimental farm attracted a great deal of attention as it was the first exhibit of any consequence shown since its establishment. The Director, Mr. J. A. Clarke, pointed out that the exhibits were not abnormal, but average products of the field. The plates containing the entire product of each hill of potatoes were especially interesting, as also were separate pannels containing heads and straw of different varieties of grain true to the name. The bunches of well matured grapes grown on the farm were a revelation to many visitors who were continually dropping in for information.

Dr. Andrew McPhail's interesting and scientific exhibit had many admirers. The products of his farm at Orwell showed skill and success. His potatoes named and shown on plates with the sets from which they were grown, together with samples of soil are worthy of special mention. Dr. McPhail is specializing on potatoes and he is putting every effort into methods of eradicating scab, and his experiments with these methods, and the effects of different soils, mussel mud, ashes, lime, etc., on the potatoes are of great value. Another interesting part of Dr. McPhail's exhibit was samples of tobacco cured and in the leaf.

The main educational feature of the exhibition was :

THE JUDGING CONTESTS.

which were not only a source of keen interest to the boys and young men who took part in the scoring, but from the remarks gathered from outside the ring it was one of the greatest means of keeping the boys on their Island farms. Mr. Andrew Elliott conducted the contest and the results show that the boys were fitting themselves to become good stockmen and farmers, and they can be looked to with certainty to improve the live stock of the Island, and not be content "to let well enough alone."

Following is the result of the competitions :

BEEF CATTLE. JUDGE'S SCORES 81.

1 and 2, George A. Godfrey, W. E. Jones, score 79.
3, F. W. McRea, 78 3-4.
4, W. Gibson, 77.
5, Leo Praught, 76 1-2.
6, M. McRea, 75 3-4.
7, D. Praught, 66.

DAIRY CATTLE.—JUDGES SCORE 80

1, F. McRea, 78.
2, Earl Ames, 77 1-4.
3, Wm. E. Jones, 75 3-4.
4. Geo. A. Godfrey, 84 1-2.
5. Dan. Praught, 65.

THE JUDGES.

Horses, P. Farrell, Woodstock, Ont.; Beef Cattle and Sheep, J. T. Gibson, Denfield, Ont.; Dairy Cattle and Swine, Andrew Elliott, Galt, Ont.; Agricultural Products, S. J. Moore, Truro, N. S.; Fruit, R. W. Starr, Wolfville, N. S.; Dairy, Harvey Mitchell, Fredericton, N. B.; Poultry, Seth Jones, Sussex, N.B.

HORSES.

As usual the Island's finest and best were out in numbers. The parade was a splendid spectacle, where the simple prize of a ribbon was felt to be worth more than gold. It was the moving picture show of the year, and those partaking in it may well be proud of their stock and the declarations of superiority given by just judges.

The carriage horses were a grand lot showing plenty of combined action and energy.

The roadster stallion class brought out some grand entries, John McPhee with "Darkwood" by "Parkside" having one of the most perfect pictures of horseflesh on the grounds, being a shade light the first place had to fall to W. S. McKee with "Birchwood" by "Oakley Baron." In this section David White showed a horse 31 years old that had plenty of quality despite his age. Two nice horses in the two year old roadster class had their own way. Jos. Fraser's "Prairie Jack" by "King Cole" and Byrne Bros.' "Nntwood" by "Comodore" Draft horses brought a large crowd to the ringside. Two-year-old Clyde Stallions brought out eight entries full of form and with plenty of bone and quality. Lea & Clarke's "Labori Again" took first. J. Morris' "Castor", second and W. W. Crosby's "Keppies Prince", third.

Clyde Stallions one-year-old, were represented by five entries, but,

were not as even a lot as the splendid two-year-old class although future development will do a great deal. Dan Stewart's "Lord Dalmeny" took first, with John Tweedie's "Aggressor" a close second.

"Atlas" by "Baron's Pride" owned by Geo. Duckendorff was the Champion Clyde Stallion, a horse well put together, and possessing great quality.

The E. R. Heartz 2 year-old Mare showed great fitting up, as also did Wm. Godfrey's whose nice colt came a close second.

Draft Mares with Foal at foot brought out ten Foals with their dams, the judge remarking on the grand quality and display of these coming horses.

One of the features of the horse show was the walking contest. The ring was apparently filled with walking horses attached to their truck wagons. After much walking, some trotting and more fun. The prizes went toJohn Newson, Chas. Bryenton, and E. G. Love in the order named.

CATTLE.

Holstein, Ayrshire and Guernsey Cattle came out in fine form. Jerseys were a disappointment. Roper Bros. with a large and good exhibit won almost everything in sight with their Guernseys.

The Holstein classes were well filled. In the Aged class, five Bulls lined up, first place going to a low set dairy type of animal belonging to John Tweedy.

In two-year-olds Lea & Clark whose stock was in splendid shape after the Fall Fairs, took first with an animal of great merit. Competition in the younger classes was keen, Lea & Clark winning the greater percentage of prizes.

The silver cup for the best Cow, of any breed or age, brought out two worthy contestants: The four-year-old Holstein of Lea & Clark which had just freshened and the prize-winning world's record Ayrshire Cow "Milkmaid" belonging to McRae Bros. After much waiting the cup was captured by the latter.

Beef Cattle showed the effect of the dry season as well as showing depreciation in the quality evinced in former years. Apparently the Island is more suitable for successful dairying.

SHEEP AND SWINE.

The Swine was an exceedingly creditable exhibit, the Berks and Yorks being a splendid lot, with some very good individuals in Chester Whites and Tamworths.

The principal exhibitors in Sheep were Messrs. Boswell, Nunn and Tweedy. Most of the stock was brought out in number one condition, with here and there an animal that would have looked better if it had been fed more generously and the fleece put in better shape.

Suffolk Sheep.

The Suffolk sheep, of which there are only a small number of flocks in Canada, belongs to the Down breeds inhabiting in their early days the southern counties of England. Although larger, more rangey and darker in points than the Southdown, the blood of this latter breed entered into the foundation of the Suffolk. The only other breed that entered into the combination was the Norfolk, which appears to have passed out of the list of modern breeds of sheep. The old Norfolks are described as upstanding, robust, active and prolific, bearing horns in both sexes, jet black fleeces of fine, soft wool that would weigh at shearing time about three pounds. Their home was the chalky Downs in the counties of Suffolk, Norfolk, Cambridge and Essex. The Southdown inhabiting adjacent counties, as already described, is a thicker, lower-set sheep, having strong powers of prepotency. Rams of this latter sort were crossed upon ewes of the old Norfolk to form the newer breed of Suffolk.

To the establishment of the Suffolk much credit is given to Mr. George Dabito, of Lydgate, who is said to have been an enthusiastic advocate of the Southdown and Norfolk combination. While the name Suffolk was not generally adopted until 1859, when classes were created for this breed by the Suffolk Agricultural Society, flocks are said to date back in purity of blood to 1810.

In recent years the Suffolks have held their own in British show rings in competition with other short-woolledbreeds. In 1883, 1884 and 1885, they defeated all others at the shows of the Royal Agricultural Society, and have since won valuable awards in the wether sections in open competition at the Smithfield Fat Stock Show. Appearing somewhat spare of body on account of bareness of head and legs and comparative shortness of wool, this breed does not appeal as favourably to one unaccustomed to them as most of the other Down sorts, but it is on the block, the true test of all meat animals, that they give a good account of themselves. Their flesh is seldom or never overfat, but fine in the grain and of strikingly fine flavour.

Island Prince of Hillside.

Champion Guernsey Bull at the Halifax, and Fredericton 1911 Exhibitions. Owned and exhibited by H. W. Corning, M. P. P., Cheggogin, N. S.

Being active and very hardy the Suffolk subsists well on either sparsely clothed hill sides or more luxuriant pasture. The strong infusion of Southdown blood, together with the care exercised in breeding during recent years, have given the Suffolk early maturing qualities. Flocks produce a high percentage of vigorous twins, which usually develop rapidly on account of the generous supplies of milk produced by their mothers.

The Suffolk Sheep Society of England was established in 1886. The first importation was made to Canada in 1888, and a few flocks have since been established in Ontario, Prince Edward Island and British Columbia. The first Suffolks taken to the United States were imported in 1888, but many have been imported since, and in 1892 the American Flock Registry Association was established.

Compared with other Down breeds the Suffolk more nearly resembles the Hampshire, and at some of the large shows even yet these two sorts are classed together. They are, however, somewhat less in size and weight, but are heavier than the Southdown or the Shropshire. Mature rams in good flesh should weigh from 240 pounds to 260 pounds, and ewes 190 pounds to 210 pounds. They are longer than the Shropshire in body and limb. The head is longer, narrower and bare of wool, although a small patch of short white wool on the forehead is not objectionable. The head and legs are glossy black. In wool production they shear a little more than the Southdown, of a quality about equal to the Hampshire or the Shropshire.

A Good Word for Mr. Glendenning.

Editor Maritime Farmer:—

Your issue of Sept. 26, contains a full account of the Fredericton and Chatham Shows, which do you credit; one likes to see agricultural papers giving such readable and interesting matter as the issue contains. Every farmer in the Maritime Provinces should be your subscriber. It is only by giving our loyal support to the home agricultural paper that we can hope to make it a complete success. Agriculture in these Provinces is quite a different proposition from what it was 25 years ago. Farm products have increased in value from 25 to 50 per cent, and our farm lands offer an inducement to the intelligent and industrious farmer, such as was not dreamed of by our forefathers.—My chief object in writing this letter, however, was to criticise your criticism of Mr. Glendenning's awards in the dairy classes, at Fredericton, which I think are unfounded, and made without due consideration —I attended the Halifax Show, and also the Fredericton Show, and I say without the slightest hesitation, that in the dairy classes I saw judged at these two Shows, the mistakes made at Fredericton, were much fewer than at Halifax. Let me particularize in one or two of the leading classes at Halifax in the aged Holstein Bull class, Logan Bros. were put first, and Harding Bros. second, at Fredericton this decision was reversed, and Harding Bros. was placed first, and Logan Bros. second. In the aged Ayrshire Bull class, the Bull which was grand Champion at Halifax and Chatham was placed third at Fredericton, and the Bulls which showed against him at these shows, were put first and second. Fault was found with Mr. Glendenning for these awards among others, and I think unjustly. There was no other place for Harding's Bull except at the top of the list, in the opinion of good judges present; and in the case of the aged Ayrshire Bull class, Mr. Glendenning gave very good reasons for making his award.

Of course your readers may say I am not qualified to pass an opinion on the way in which judgment was given. In my own defence and without being immodest I may say that I have had 40 years experience in raising and handling pure-bred dairy cattle of different breeds and have also had the honor of acting as sole judge of dairy cattle at more than one of our Nova Scotia district Shows and knowing what a difficult place the judge occupies I am not willing to see a stranger sat upon in this way by disgruntled Exhibitors, who cannot see past their own cattle, without saying a word in his defence.—C. P. Blanchard, Truro, N. S.

Editor's Note:—We are always pleased to get communications for publication from Mr. Blanchard. We know he has had a long experience in the handling of pure-bred stock and the fact that his services have been frequently sought to place the awards at some of our progressive local shows is an ample indication that he has taken advantage of the various opportunities for studying live stock characteristics that have presented themselves during the past forty years.

In regard to Mr. Glendenning's judging at Fredericton, we still hold and have no hesitation in saying that Mr. Glendenning did his honest best without fear or favor but we do affirm that in our opinion and in the opinion of the greater percentage of the Stock Breeders who exhibited and who know what they talk about that his judgment did not give satisfaction, and that in not a few cases the winners of the red ribbons did not expect them and were surprised when they found that the animals they held were placed at the top of the list.

We always express our own opinions of a show and do not make a practice of stooping to the position of a tool for any exhibitor whether disgruntled or elated.

As a visitor to our Fairs we know our breeders will welcome Mr. Glendenning whenever he chances to come this way but we do not think they will ever again ask him to place the ribbons.

How I Would Farm.

A Has-Been tells in a recent issue of the Maine Farmer what he would do if he was a young man as follows:—

"Having nearly reached the threescore and ten limit, I feel that my legs and back would not allow me to do as I would like to do. I have seen the introduction of the mowing machine into Cumberland county, and many other labor-saving machines and implements worthy of note. I have been surprised many times in canvassing some of our most popular townsmen and farmers for the use of these machines to hear them say that they knew but little of them, only as they have seen them on exhibition and at work in the field as they have ridden by.

I have seen the time that I felt like crying aloud in the ears of our young farmers that there is a better way to do farm work than wholly by hand labor.

Geo. M. Clark did a good work in his paper on "Intensive Farming." "Eternal vigilance is the price of success," in farming or any other business.

"Take one of our old worn-out farms. It may have been the abode of thrift, but the suceeding generations could not be interested to keep up the fertility and repairs needed, so it has passed from one to another. They have gotten what they could scrape off from it, to put into money. There stands the old farm like a beggar, saying by its looks, "I will aid you if you will deal right by me." The first thing needed is to practice some common sense in how, when and where we put in our efforts called farming.

Practice the study of nature. The soil should be broken in the fall, just after the drouth; harrow with a wheel harrow so as to free the soil from weed seed, and let the frost work it over. If the summer-made manure is to be drawn out

before spring, do it with a spreader and harrow it well.

My experience is that oats sap the land more than yellow corn or wheat. Some of the best catches of grass seed of late years is where corn was planted and a horse weeder was used and the grass seed was sown among the corn and worked in with the weeder.

"This weeder is a good implement if it is used before planting to smooth the land for the planter. Then use the weeder every week until the little weeds are killed. For potatoes use land the same in the fall. In the spring furrow out the rows quite deep, use fertilizer and the weeder. Use the cultivator and hiller, then use the weeder to work the dirt among the plants. It is much easier to have a good horse help than it is to do it alone.

"Don't dig potatoes until after dog days have passed, to have them keep well in the cellar for winter. As soon as the corn has turned ripe, gather off the ears and husk, and sort and store in a good airy bin at the side of the granary. The corn fodder should be cut up and put into a silo.

"In these days of "high cost of living", and "back to the farm," the farmers ought to be willing to cooperate and buy some of these labor-saving implements, or hire them of those who are public-spirited enough to be owners. Try it once and see them do the work. In this manner the fields can be gone over as often as the pile of manure will go. Then it is up to us to have a good-sized pile of manure.

"Farming has declined since ox and steer teams became unpopular.

"The manure question is the main one for every day discussion. Does it pay in the end to use much commercial fertilizer? Does it hold up the land year after year? In these days of manure spreaders, it seems more like common sense to make an effort to use up the by-products on the farm before sending out money for what can be produced on the farm, and put the surplus money into the bank. We read that there is as much nitrogen in muck as there is in hen manure. If so, go for the muck swamp. Years ago there was a lot worked up in the compost heaps, all by hand. Now put the muck over the barn cellar bottom, then put on some hogs' and drop down manure from cattle and horses. It will be much better than to be used alone.

"Raise every good calf; don't try to raise a little runt no matter what is the breed. Keep them growing, and have the heifers come in when two years old. If they do well, keep them another year; if not, turn them for beef as soon as fat. Cows sell best at five and six years old. It is up to the farmers to manufacture the kind of stock the market demands to supply the public's wants. Our mills do not come to the farmers and ask what kind of cloth do you want us to make for you; they prefer to tell you what you need to buy, no matter if it is more than one-half shoddy, or shoes made of pasteboard.

"If one has a liking for farm life and being among the various animals, he will find pleasure at times almost equal to a circus, and can be the ring master at home without an admittance fee.

"Experience has taught me that our time should be well divided to give us success, and not get played out often. Regularity is a good motto. On a farm there are many things to be looked after; see that all are in their places.

"Another thing that only a few realize—to be a good farmer, one must possess more practical knowledge than any other vocation or profession; and then may be called a "hayseeder." This is like the slave owners of the South calling the Northern laborers "mudsills." Rest is very essential as well as labor. The active farmer has no need of a "gymnasium" to get up muscle. Industry wins.—A Has-Been.

Tidings from The Far West.

Editor Maritime Farmer:—

I write this letter to give you some information re British Columbia live stock and exhibition conditions.

I have been one week judging at Vancouver and one week at Victoria and still have several other shows to attend, among them being the Provincial at New Westminster.

They claim to have the best horses on the continent at the Victoria and Vancouver shows. The prosperous people of British Columbia are proud of their horses. They take good care of them and they are willing to go any distance and pay well for high class animals, the only kind they want. Some of the horses shown were secured at Toronto, New York, in Scotland, England, and Ireland, while others were bred in British Columbia.

In one section, a British Columbia production won over the imported horses. Successful show Drafters are valued here at from ten to twelve hundred dollars, and show saddle or carriage animals soar as high as five or six thousand dollars. There were many beautiful heavy animals, mostly Clydesdales, at Vancouver, while there were only two Percerous and two Shires. There were two Suffolk Punch horses at Victoria, all others were Clydes. At both shows there were many splendid Standard bred Hackneys, thoroughbreds and several breeds of Ponies. In the thorough bred class, none equalled some of your New Brunswick animals such as Waterlight or that mare of Mr. Taylor's at Rothesay.

One of the exhibitors was particularly nice, probably because his wife is a New Brunswick lady and his voice indicates he had a Scotch origin. He is canny as well as entertaining. At a banquet held after the show he was undoubtedly the hit in replying to the good losers but he was not often a loser and when he was it was to his friend another delightful exhibitor whose wife and daughter are good losers also.

One very valuable feature in this show was a Groom's contest, some of whom showed their animals in such a manner as to present all their good qualities while others showed the same animals in such a way as to depreciate them thirty percent. Although they were endeavouring to show to the best possible advantage. Many of the contestants were experienced men from the show rings of Scotland, England, Ontario and the United States.

In the Dairy Cattle ring were several animals from Nova Scotia and good ones they were, but a Sussex Dairy Cattle show would be a surprise here in point of quality of the several breeds and grades as well as the numbers.

The British Columbia shows are still young in comparison to some of the Eastern shows and the ambition of the British Columbia exhibitors is such that if the Maritime Provinces will produce of its best, they can attract the purchasers from here. Only high class goods will attract. Beef breeds were not strong. Some fine Sheep and Hogs were exhibited as were Poultry, Dogs and Cats. Kittens offered for sale at twenty dollars each and Dogs valued at six hundred dollars. Two of the Dairy herds were in charge of Maritime men and a Maritime man won in the judging Horses and Dairy Cattle and in the Milking contest. I have met many people from the Maritime Provinces, not one a disgrace to his Province. They are all proud of their old homes and admit they possessed many advantages they did not realize until they left them.—J. Standish, N. S.

Champion Guernsey Female at the Halifax Exhibition. Owned and exhibited by Roper Bros., Charlottetown, P. E. I.

Relation of Country Church to Property of the Farm.

If we were going into an old settled country to buy a farm, the first thing we would do, after looking over the farm itself and making an estimate of the character of the soil and buildings and neighborhood would be to inquire into the condition of the country church. We would first visit the church and ascertain its physical condition, and note particularly whether there were sheds near it to protect the horses from the summer storms and winter blizzards. We would inquire into its membership, find out whether it was increasing or decreasing, what salary the minister was paid, whether it was paid promptly, whether there was a parsonage or not, and if so, in what kind of repair.

The reader may ask: What has this to do with the farm? Much in every way. If there is a thriving church, kept in good condition, with shelter for the horses, a live pastor, a large Sabbath school and increasing in attendance, we would conclude that this was a safe place in which to rear a family, that the influences which would there come to the children in the most plastic period of their lives would be such as would tend to make them strong, clean men and women.

On the other hand, if the church building was dilapidated, if there were no horse sheds, if the membership was decreasing, if the pastor was paid a salary which necessitated his making sacrifices which no man in a good farm community should be required to make. We would conclude that it was a poor place in which to rear a family.

We would inquire particularly about the pastor, whether he was a man who dealt mostly with things of the other world and his mission to prepare folks for it, or took a lively interest in everything that concerns humanity in his neighborhood. If we found a man who visits every family in the community, regardless of church relations, and knowing every farmer at a distance by the horse he drives; if he took an interest in all the affairs of the farming community, and made himself generally useful to his neighbors, then we would feel that it was a good neighborhood in which to rear children. If we found that in addition to the above he knew something about farming, knew enough at least to ask questions about it, and kept some small live stock—a cow, chickens, or a pig or two—in fine condition, we would want to have a stake in that neighborhood.

As a matter of fact, the condition of the country church in a neighborhood is a very fair indication of the character of the people of the community. If they insist on giving their pastor only seven or eight hundred a year, with the idea of piecing it out with a sack of corn or jag of hay, or an occasional pat of butter, we would make up our minds that those farmers were rather a small-souled lot. If they paid him a salary on which he could live comfortably, rear and educate his children properly, then we would conclude that we had struck a lot of broad-minded, large-hearted, wide-awake farmers, who thought in dollars instead of nickels, in hundred dollar bills instead of tens; in other words, thought on the same scale in dealing with the educational and spiritual side of their lives that they did when dealing with the material and business side. We would feel that this would be a good community in which to own a farm. The country church is an indicator of the character of the community, and the spirit of the preacher has something to do with the spirit of the people among whom he lives and to whom he ministers.—Wallaces' Farmer.

Stock Notes.

J. Frank Roach, Sussex, N. B., shipped a choice two-year-old Guernsey Bull to W. W. Johnson for the North Sydney Agricultural Society. Mr. Roach has quite recently had his stock tested by Jas. H. Frink, Dominion Veterinary. They all passed the test and showed no sign of disease in any form.

Prof. Chas. Oviatt, of Laramie, Wyoming, State University, purchased several head of Guernsey Cattle from the Sunnyside Stock Farm, J. Frank Roach, Proprietor, and some from Glenview Stock Farm, Walter McMonagle & Son Proprietors Sussex, N. B. The professor will take away, in all, about two carloads. These cattle are for breeding purposes on the State University farm. Prof. Oviatt is also taking some cattle from Maine. This is the second shipment of Guernseys Mr. Roach has made to that University, while Mr. McMonagle sold them Jerseys before.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

Breeding to Purebred Sires.

The farmer or dairyman who begins now to breed his cows to a good purebred male, and saves and breeds all the heifers, will soon be in a position to sell heifers and young cows at handsome figures, and buyers will come to his door eager to take them at high figures. As an instance of what may be accomplished in this way, we would refer our readers to the advertisement of Messrs Lea & Clark of Victoria, P. E. I., whose advertisement appears on the breeders pages of this issue. These young men, a few years ago, decided that they would grade up their herds by the use of pure bred Holstein Friesian bulls. They have zealously followed this decision and have gone one better by adding an occasional purebred cow or heifer to their herds. In this way they have worked up two magnificant pure bred herds, the grades growing fewer in numbers while their pure breds are increasing. This has all been accomplished in the course of a few years.

In their present advertisement these progressive dairymen are offering ten, good, young grade Holstein cows, fresh or forward in calf, tried and tested and guaranteed as described. These cows tested not less than 3.8 per cent. butter fat during this present year and some have tested over 4 per cent. They are all included in the herds that averaged 8000 lbs. milk and nearly 340 pounds butter at the factory last year. Messrs Lea & Clark know the production of their individual cows, they use brains in their business and their example in building up profitable dairy herds may well be emulated by more of our Maritime Province young men. These gentlemen find the East and profitable farming good enough for them and so will you if you follow in their progressive footsteps.

Any reader of the MARITIME FARMER who is in need of pure bred live stock of the profitable kind will do well to drop postal cards to the breeders who are advertising in this paper, asking for particulars and prices. Young men who are thinking of starting, as well as established breeders, can do us a kindness and also benefit themselves by writing to our advertisers and saying they saw announcement in THE MARITIME FARMER.

What all Farm Homes Need.

The following article on "What all Farm Homes Need," from the pen of Professor L. H. Bailey, appeared in a recent issue of The New England Homestead. It contains such excellent ideas that we pass it along to our readers :—

"The farm home establishment is becoming more and more complex. One thing after another is being added to it. The farmstead comprises not only the ordinary barns and the residence, but new kinds of poultry houses, windmills, dairy rooms, gasoline engines, sewing machines, rural delivery boxes, water works, lawns and flower gardens, ice houses, and many other extensions and attachments are being gradually incorporated into the scheme. All these conditions tend to make the home more effective, to broaden the operations of the farm people and to relate the establishments of the larger affairs of the neighborhood and the world. Many other things will be added to the farm home, because this home must concentrate into itself all the essential enterprise making for a better country life. Into the growing conception of the farmstead I desire to project another unit. On every farm there should be a piece of land definitely set aside for the children and the young folks, to be used in the developing of the intelectual interest in the farm and in country life. It is the responsibility of every parent to train the children. This responsibility cannot be delegated wholly to the school or to any other agency. If the farm family must take a real part in the educational development of its children, it must then have some kind of an establishment for the purpose. This establishment should be incorporated into the school system of the district.

On every farm there should be a school garden or child garden, in which the children may make their tests, grow their plants, and work out the school problems. It is impracticable in most cases to have school gardens or test plots on the rural school grounds. Such gardens should be at the home, and the children should be encouraged to take the school thought home with them and to plant it in the garden. A list of these home gardens should be in the schoolhouse. The teacher should ask for reports from the children. She should set problems to be worked out in the gardens, and the areas should in all ways be regarded as the connecting physical link between the home and the school.

"This child lot might be a half acre, or an acre, near the house and the barns, permanently set aside, for the purpose and be made just as much a part of the farm establishment as a milk house, a carriage shed, a clothes yard, a chicken yard or any other side lot of the farm. In this test area many kinds of demonstrations could be made. Here new varieties of fruits, vegetables and flowers could be tried, fertilizer tests could be made, different ways of planting, different methods of tilling and of handling crops could be undertaken, the attractive wild plants of the farm could here be collected, bird houses could be erected. This area could become in time one of the most attractive places on the farm, particularly if it were inclosed with a hedge or a wall of attractive native or other bushes, and if it were to lead down to a brook, or to contain a spring, or to have a little pond.

"The farmer has other responsibilities to education than merely to pay his taxes for formal school facilities. He cannot by any means escape his responsibility in the development of a better country life. He must express this responsibility largely in the better education and training of his children. Merely to be a successful farmer is not a sufficient object in life. A man cannot wash his hands of his obligation to society by making even an ideal school in his community; he must himself actively help in the education of the new generation. This is his responsibility to society. If he is to help he must have a means or an establishment for the work.

New Brunswick Apple Show.

The second annual provincial apple show which will be held in St. Andrew's Rink, St. John, will be formerly opened by Premier Hazen, Hon. Dr. Landry and others, at 8 p.m. Monday, October 30th, and will run for the following three days. The apple crop is exceptionally good this year in the province and a marked improvement in quality over last year's exhibits is assured. Upwards of $800.00 is being offered in prizes. Several new features will also be introduced, the aim of the management being to place before the public of St. John and the fruit growers of New Brunswick a display of apples, hitherto unsurpassed in Canada. Leading authorities on apple culture from Ontario and Nova Scotia have been engaged to judge the exhibits and deliver addresses. Return tickets from any point on the Canadian Pacific and Intercolonial Railways will be issued on Standard Certificate plans, for single fare. The Fruit Growers' Association will meet in Convention on the same dates. For complete list containing particulars and program, write to A. G. Turney, Fredericton, N. B.

Up to Date Farmer.

When a farmer breeds indifferent cattle, horses or sheep, he receives less for his labor and feed than he should receive, adds less to the wealth of his state than the up-to-date farmer, and is at a disadvantage when he undertakes to secure for himself and family the things which help to make life worth living. We do not mean to say that the individual farmer owes more to the community or to the state than the laborer, the lawyer, the doctor, the educator, the preacher or the business man; but we do expect more from them as a whole, because there are more of them than all these others combined.

Prize Winners at the Charlottetown Exhibition.

THOROUGHBRED HORSES.

Mare, 3 years old—1, H. H. Horne; 2, John Stewart, Marshfield; 3, J.Mc Millan, Covehead.

CARRIAGE HORSES.

Stallion, 4 years old—1, David Reid & Son, Victoria Cross; 2, John Mc Phee, Lower Freetown.

Stallion, 3 years old—1, Nelson Mc Coubery, Rustico; 2, J. J. McLeod, Bonshaw; 3, D. W. White, York Road.

Stallion, 2 years old—1, Wm. Bateman; 2, Leslie Bryenton, Trilby.

Filly, 3 years old—1, H. E. Crosby, Bonshaw; 2, Wallace Wood, Alexandria; 3, Robt. E. Longworth, Royalty.

Filly, 2 years old—1, Edwin Carew, Bungay; 2, Dan McDonald, Clyde River; 3, Edgar R. Heartz, Marshfield.

Filly, 1 year old—1, Ira Carr, Cove Head; 2, Henry Wood, Mt. Herbert; 3, W. W. Owen, Southport.

Foal of 1911—1, Heber Crosby, Marshfield; 2, John A Cummings, Wiltshire East; 3, Albert C. Foster, Dunstaffnage.

Mare with foal at foot—1, John A. Cummings; 2, Almon Boswell, Pownal; 3, Daniel Howard, Milton.

Carriage mare or gelding, 15½ hands or over, to be shown in carriage—1, G. D. Wright; 2, John Ford, Ebenezer; 3, Wm. Bateman.

Carriage mare or gelding under 15½ hands, to be shown in carriage—1, Misses L. and H. Stallo, Dalvay; 2, Henry Wood; 3, Gordon Hughes.

Champion Mare, any age—H. E. Crosby.

SADDLE HORSES.

Gent's; shown under saddle—1, E J. Vessey, Covehead; 2, Misses L. & H. Stallo; 3, D. McDonald.

Ladies'; not less than 15 hands, shown under saddle—1, Misses L. & H. Stallo; 2, Miss P. McLaughlan; 3, A. H. Boswall.

HACKNEY HORSES.

Stallion, 3 years old—1, John B. Roper.

Filly, 2 years old—1, Almon Boswall.

ROADSTERS.

Stallion, 4 years old—1, W. L. Mc Kie; 2, John McPhee; 3, Daniel N. Taylor, Nine Mile Creek.

Stallion, 3 years old—1, Joseph Fraser, Avondale; 2, Byrne Bros.

Filly, 3 years old—1, Vernon Mc Millan; 2, Frederick Mc Donald, York; 3, George Dockendorff.

Brood Mare with Foal at side—1, Byrne Bros.; 2, Wm. L. Essery, Union Road.

CLYDE HORSES.

Stallion, 4 years old—1, Geo. Dockendorff; 2, St. Peter's Clyde Horse Co.

Stallion, 3 years old—1, Wallace Stead, Highfield.

Stallion, 2 years old—1, Lea & Clark, Victoria; 2, John P. Morris, 3, W. W. Crosby, Cornwall.

Stallion, 1 year old—1, Daniel Stewart, Southport; 2, John Tweedy; 3, Dr. A. A. Leckie.

Filly, 3 years old—1, Daniel N. Taylor; 2, A. H. Boswall; 3, Thos. P. Cass.

Filly, 2 years old—1, Edgar Heartz; 2, Wm. F. Godfrey, Marshfield.

Filly, 1 year old—1, W. W. Crosby; 2, John P. Morris; 3, Thos. P. Cass.

Foal of 1911—1, Hector McNeil, New Dominion; 2, John P. Morris; 3, Leslie Bryenton, Trilby.

Mare, with Foal at foot—1, Wm. Godfrey; 2, Chas. E. McKenzie, North Milton; 3, Hector McNeil.

Champion Stallion, any age—1, Geo. Dockendorff.

Champion Mare, any age—Edgar Heartz.

DRAFT HORSES.

Filly, 3 years old—1, Leslie McEwen.

Filly, 2 years old—1, Frederick Long; 2, Heber Crosby; 3, Edwin Carew, Bungay.

Filly, 1 year old—1, Jas. Livingston, Clyde River; 2, Jas. G. Hughes, Cove Head; 3, Wm. L. Essery, Union Road.

Foal of 1911—1, John Newson; 2, Chas. Bryenton; 3, Oliver Saunders.

Mare with Foal at foot—1, John Newson; 2, Oliver Saunders; 3, Chas. Bryenton.

Pair of Draft Horses, not less than 1400 lbs. each—1, Roper Bros; 2, J. J. McLeod, Bonshaw.

Draft Mare or Gelding not less than 1400 lbs.—1, Major S. Milligan, Tyne Valley; 2, Wm. Bateman; 3, A. A. Mc Beath.

GENERAL PURPOSE HORSES.

Mare, 3 years old and upwards—1, Geo. Dockendorff; 2, J. W. Wedlock, Brackley Pt.; 3, D. W. White, York Pt.

Mare, 2 years o,d—1, Stanley Prowse; 2, Wallace McLure; 3, Robt. Longworth.

Brood Mare with Foal at foot—1, Wm. L. Essery; 2, John Stewart, Marshfield; 3, John A. Cummings.

SPECIALS.

Given by Mr. John B. Roper, Charlottetown Royalty, For the best Colt or Filly, 1 year old, sired by Imported Hackney Stallion "Fashioner"—1, A. A. McBeath.

For the best Foal of 1911 sired by the same Stallion—1, Heber Crosby; 2, Albert C. Foster; 3, Almon Boswell.

Given by Bank of Commerce, Silver Medal for best Clyde or Shire Stallion—1, Geo. Dockendorff

CATTLE.

SHORTHORNS.

Bull, 3 years old—1, Samuel C. Lane, Mt. Mellick.

Bull, 2 years old—1, Thos. P. Cass; 2, H. F. Sanderson.

Bull, 1 year old—1, Albert Boswall, Pownal.

Bull Calf, under 1 year old—1, Thos. P. Cass; 2, H. F. Sanderson.

Bull Calf, under 6 months old—1, Thos. P. Cass.

Cow in milk or calf, 3 years old and upwards—1, H. F. Sanderson.

Cow in milk or calf, 2 years old—1, Thos. P. Cass.

Heifer, 1 year old—1,Thos. P. Cass.

Heifer Calf, under 1 year—1, Thos. P. Cass.

Heifer Calf, under 6 months—1 & 2 Thos. P. Cass.

Champion Bull—1, Thos. P. Cass.

Champion Female—1, Thos. P. Cass.

Breeders' Young Herd—1, Thos. P. Cass.

HEREFORDS.

Prizes went to Louis Hayden, Cherry Valley.

SHORTHORN, HEREFORD, POLLED ANGUS OR GALLOWAY GRADES.

Cow, 4 years old, in milk or calf—1, Thos. P. Cass; 2, Robt. E. Longworth; 3, A. H. Boswall.

Cow, 3 years old—1, Robt. E. Longworth.

Heifer, 2 years old—1, Vernon Mc Millan.

Heifer, 1 year old—1, Jos. Praught, 2, Robt. E. Longworth; 3, Thos. P. Cass.

Heifer Calf, under 1 year—1, A. H. Boswall; 2, Jos. Praught.

Heifer Calf, under 6 months—1, Jos. Praught.

STEERS.

Best single Steer, 2 years old—1, John Stewart; 2, Robt E. Longworth.

Best pair of Steers, 1 year old—1, A. H. Boswall.

Best single Steer, 1 year old—1, Jos. Praught; 2, A. H. Boswall.

DAIRY CATTLE.

AYRSHIRES.

Bull, 3 years old and upwards—1, R. W. Bulpitt, Cardigan; 2, Ambrose T. Rodd, Winsloe.

Bull, 2 years old—1, Simmons Bros.; 2, Bert R. Brown, Little York; 3, John Stewart.

Bull, 1 year old—1, Robert Stewart Winsloe; 2, Chas. H. Robertson, Marshfield.

Bull Calf, under 1 year old—1, Mc Rae & Son; 2, Theo. Ross.

HORTICULTURE.

Pointers on the Cultivation of Raspberries, Blackberries and Currants.

A sandy soil or clay loam of moderate fertility and well provided with humus is good for cane fruits. It must not be wet, but should be resistent to drouth. The amount and kind of fertilizers needed differ with the soil. On good soil raspberries and blackberries need little barnyard manure, and what is used should be applied in Autumn or Winter, that it may not cause a late, sappy growth, Whether potash and phosphoric acid may be needed depends upon the soil, and no general rule is safe. The intelligent use of such fertilizers frequently pays well, but it is easy to waste money upon them. Gooseberries and currants are heavy feeders, and need an abundance of barnyard manure. The preparation of the soil for the cane fruits should be deep and thorough, and fresh sod should be avoided.

Our hot, dry Summers are hard on the cane fruits, and a north slope not steep enough to wash has a decided advantage. Evaporation is greatly increased by the wind, and a windbreak on the west side, from which our prevailing winds come, is very helpful, but its roots will rob the plantation if planted too near.

It is a common practice to plant raspberries and blackberries rather closely in rows wide apart. This renders horse cultivation easy between the rows, but impossible across them making much more hand labor necessary if the cultivation is properly done. The red raspberries and blackberries soon become veritable hedge-rows, the plants being too crowded to give the best yields and quality of fruit, and making even hand cultivation difficult. The practice of setting the plants at distances that will permit horse cultivation in both directions and treating all suckers not in the hills as weeds improves the quality of the fruit, and greatly reduces the labor of cultivation, without greatly diminishing the yield.

A convenient way to set out the plantation is to mark off the ground at proper distances in both directions, and to furrow out the rows one way, setting the plants where the marks cross the furrows. The roots of the plants should be dipped into mud a short time before setting, or kept wet by carrying the plants in a vessel of water. The roots should be spread out in all directions, and moist soil should be thoroughly worked among them and packed around them. The remainder of the furrows may be filled by subsequent cultivation. If the ground should be hard or the subsoil near the surface, the plants should not be set very deeply, but in a loose, mellow soil they should be rather deeply planted. This is especially true in the West, where severe drouths occur, As a rule, they should be set an inch or two deeper than they stood in the nursery rows.

Thorough cultivation should continue until Midsummer, or until after the fruit has ripened, if that should be later. In sections of abundant rainfall cultivation continued too late is likely to cause a late, sappy growth of wood that will Winterkill, but in regions subject to Winter drouth cultivation should continue until cold weather to retain the moisture. In small patches mulching with straw is sometimes practiced, instead of cultivation, with good results. This practice causes the roots to grow very near the surface, and one cannot change from mulching to cultivation without destroying many of the roots.

The bearing canes of raspberry and blackberry bushes should be cut out and burned soon after the fruit is gathered. A pair of long-handled pruners, or a hooked blade attached to a handle 3 or 4 feet long, is a good tool for this purpose.

In setting out red raspberries one may use plants a year old, or growing plants a few inches high may be moved in late spring or early Summer with a ball of earth on the roots. Pinching back the young canes, unless they are very small, causes the growth of late, weak branches, likely to Winterkill. It is better not to prune the canes until the following Spring, when they should be cut back to 3 feet high. They will then throw out vigorous side shoots, on which the fruit will be borne. They are usually planted 3 x 6 feet apart, but 4 x 5 feet, with cross-cultivation, is better. Loudon and Cuthbert are good varieties. The plantation will begin to decline after these crops have been gathered, and should be plowed under.

Currants need a stronger, cooler soil than raspberries or blackberries. The fruit is borne most abundantly on spurs and branches from the two-year-old wood. A good way to prune the bushes is to allow a few strong shoots at proper distances to grow up each year, removing all other sprouts and cutting out all three-year-old branches each Autumn or Winter, never allowing any branches to become more than three years old. Red Dutch, Victoria and White Grapes are reliable old varieties.—John L. Doan.

Best Orchard Cover Crop.

In a small way I have had remarkable success with winter vetch as a cover crop. I sowed 16 acres last fall on land not inoculated and it took hold gloriously. I think it is the finest cover crop I ever had. Have sown from August 5 to as late as September. Last year I sowed some with rye, but the vetch grew so fast the rye had no chance. The inoculation of the vetch with bacteria was very helpful, I think, although the land had grown cowpeas before.

A friend wanted to inoculate his vetch, but the material did not come as soon as his seed did, so he sowed the seed vetch and then in a day or two he sprinkled the inoculating bacteria across one section of the field. The difference in growth was very marked. Where the bacteria was applied the vetch was a thick mat, 6 to 8 inches high in October, while in other places it was just above the ground and growing only a little.

I believe the ideal cover crop is hairy vetch. The ideal crop, though sometimes, like some other ideal things, is the most difficult to get. The hairy vetch forms a very close, green cover and mat on the surface of the ground. It germinates readily and vegetates early and late, that is grows early in the spring and late in the autumn, is hardy, and is an annual. That sounds easy, but the seed is hard to get and it is expensive. While it will cost a good deal, I think it is worth while to attempt to grow one's own seed. I think every fruit grower ought to grow his hairy vetch seed. It costs about $5 a bushel.—Prof. John Craig, New York Agricultural College.

Growing Cabbage.

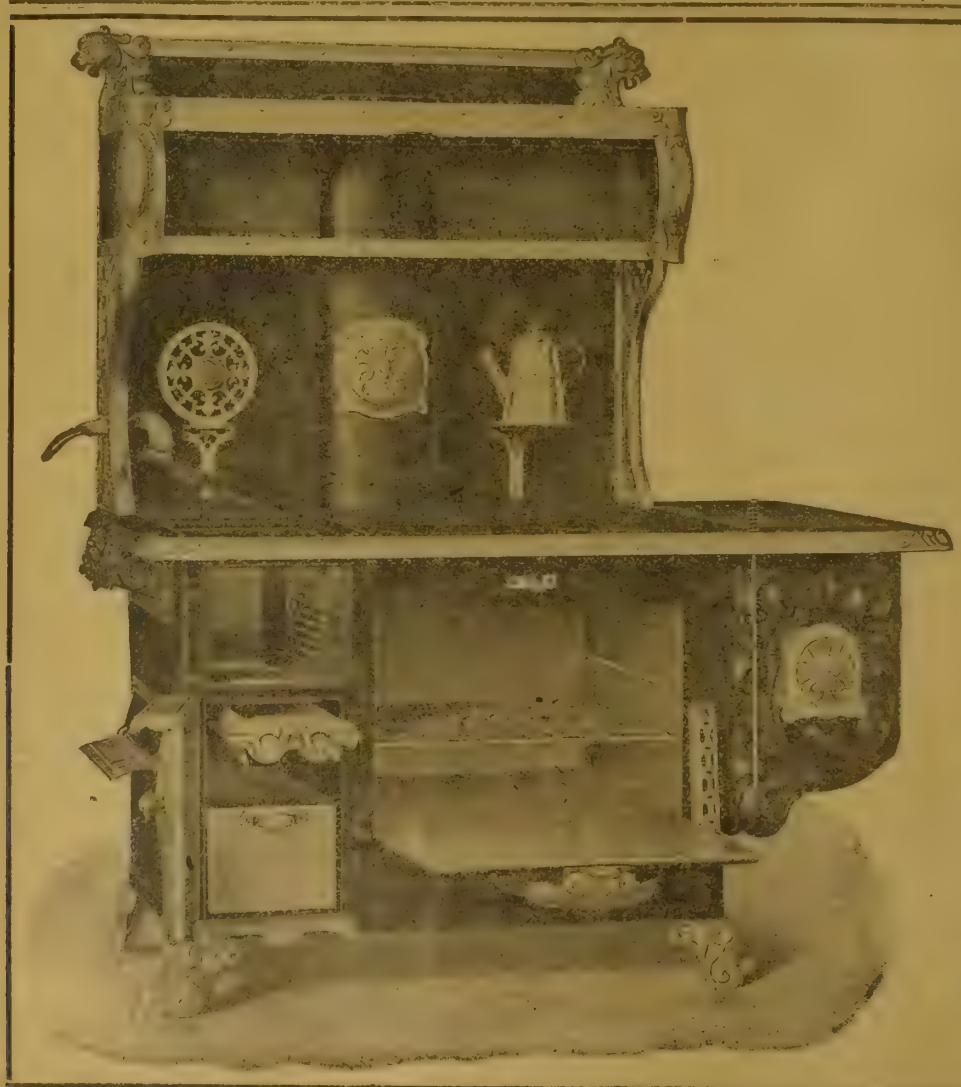
PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.



The Universal Favorite

Is a High-class Family Steel Range, honorably built of the best material, and put together as tight as a steam boiler, and is guaranteed to cook and bake perfectly.

NOTE:—The spacious fire box for wood.
The large fire box opening, 7½x8½ inches.
The roomy square oven.
The top-hinged key plate.
Also note how easily the coal grates can be removed.
The linings can be changed from coal to wood, or vice versa, without the disturbing of a bolt.

There are thousands of Universal Favorites in the homes of our farmers, making cooking and baking a pleasure and the kitchen work easy and light.

THE UNIVERSAL FAVORITE is specially built to meet the requirements of farm homes. The top is large and roomy with six pot holes, the oven will bake sixteen loaves of bread in pans 4 1-2x10 inches at one time. The fire box for wood is 29 inches long, and will burn coarse wood of any kind

NO RISK IS TAKEN, as an unqualified guarantee goes with every UNIVERSAL FAVORITE that it will cook and bake perfectly.

The Universal Favorite is procurable from a dealer in your market town. Manufactured by,—

FINDLAY BROS., CO. Ltd., Carleton Place, Ontario.

H. H. DRYDEN, Sussex, N. B., Representative for Maritime Provinces.

This Beautiful Catalogue

Is handsomely printed on fine quality paper of extra weight and finish. It shows many hundreds of different designs in Men's and Women's Fine Furs and Furlined Garments. Eighty pages of elegant halftone engravings with truthful descriptions and PRICES and such prices! Never before have the people of Canada been offered an opportunity to buy

PAQUET FURS

At the actual MANUFACTURER'S PRICES of Canada's Largest Fur Factory. And REMEMBER—you don't need to pay one cent in advance! We'll send the Furs, PREPAID, to any Express office in Canada for Free Examination. If you are not convinced that the value cannot be matched, return them, at our expense. If you are pleased—and we KNOW you will be—pay the Express Agent the catalogue price and the Furs are yours. Could anything be fairer?

bage and Cauliflower As Market-Garden and Farm Crops."

The bulletin treats cabbage as a market-garden crop and as a farm crop. Under the former head the questions of soil, young plants in the market-garden, setting plants in the field, cultivation, harvesting and varieties are thoroughly treated. Under the head of cabbage as a farm crop, soil, the preparation of the land, starting the seedlings, setting the plants in the field, harvesting, varieties and storage are taken up and discussed. The question of storage is a very important one and is given careful attention. Insect enemies and diseases are also discussed, cabbage worms, cabbage root maggots, and the cabbage aphis among the former, while clubroot is the only disease of importance. This it is hard to control, the only method being to follow the list of 'don't" which are given in this article.

Cauliflower is discussed briefly, it being pointed out that practically everything previously said in relation to cabbage is equally applicable to cauliflower. The bleaching of the heads and storing for winter use, in celery pits, are described. The bulletin concludes with the following statement: "There is no mystery about the growing of cauliflower, if treated exactly like cabbage, except for the protection of the leaves, as above indicated, it can be grown in any garden, and forms so attractive and tempting a table vegetable that it should be among those grown by every person having a garden for the furnishing of his own table."

DAIRYING.

Ancestral Influence.

"The question has arisen as to which animals in the pedigree of a dairy sire should receive the most careful consideration. We came to the conclusion that there were five that should be especially studied. I name them in the order of the relative weight we thought they should have: First the dam, second the sire, third the dam of the sire, fourth the maternal grandam, fifth the paternal grandsire."

So far as mere transmission of milking quality is concerned, there is no evidence that either the sire or the dam is prepotent over the other. Speaking in a general way, all evidence goes to show that in animal breeding the sire and dam have equal powers of transmission, providing they are equally well bred. The idea that the sire is prepotent over the dam because he is a male has no foundation in fact, and the idea that the dam is prepotent because she carries the young is equally unsupported by evidence.

Speaking more in detail, however, the most careful statistical studies show that in certain characters and to a slight degree the one parent may be prepotent over the other. For example, the English father is prepotent over the mother in respect to stature in both sexes, though slightly more so with the son than with the daughter. Conversely, as to coat color, both in thoroughbred horses and in Basset hounds, the reverse is true, and the dam is slightly prepotent over the sire.

If accurate study were possible as to this particular character we should not be surprised if one parent or the other might prove slightly prepotent but which one there would be no means of predicting, nor have we any reason to suppose that the difference of this kind would be more than slight. So far as pure transmission goes therefore, I should say there is no present reason for placing either parent over the other in influence upon the offspring, except as one is known to be the better bred.

When however, we get to the means of estimating prepotency the advantage is clearly on the dam's side. She can be put to the direct test, whereas the best that can be done with the sire is the indirect test through his get. The performance record of the dam shows exactly what her contribution will be to the probable performance of the offspring. The best that could be done on the sire's side would be to compare the average of his get with such a record, after making due allowance for the quality of the dams on which he was bred, all of which is an exceedingly difficult thing to do. From the pure standpoint of judging, therefore, there is a good basis for giving more careful consideration to one parent than to the other. For simple ease of work, I should give the preference to the dam, unless the sire were old enough to have produced a long line of performance, in which case I should transfer the first attention to him, or rather to his female get. In most practical breeding problems, however, where the sire is better bred that the dam, I should give the leading place to the dam of the sire until such time as his get should have become numerous enough to judge of his real breeding powers, after which I should again transfer the first place to him.

All of this is intended to mean first of all that the chief consideration should go with the best line of breeding, and so far as sex is concerned, it goes at first to the dam because she can be tested at a younger age, but finally rests with the sire because his get is more numerous and will ultimately offer a better index to his breeding powers than can ever be obtained from the female.

I should criticize the conclusion of your inquirer in limiting the chief consideration to the number five. To my mind, on general principles, it should either stop at four or be extended to eight, unless there is a notable difference in the quality of the bloodlines.

It is impossible to discuss questions of this kind and rate animals in this way except very roughly, and any rating that might be established for one particular pedigree would certainly be modified and rearranged for another.—Breeders' Gazette.

How Long Should a Cow be Kept?

When we consider how very difficult it is to build up a good milking strain and how certain is the fact that large numbers of animals in this country give yields that are not profitable, the question of how long a cow should be kept will be recognised as one to which it is impossible to give a definite answer in terms of years. It must depend almost entirely on the animal herself. Most breeders who have an animal that gives a large supply will keep on breeding from her as long as the return is profitable, and on the whole there can be no better guide than this when we are dealing with cows that are really above the average. But when it comes to actual practice, in regard to the dairy herd generally, something more definite is required. There is a more or less general belief that the milk of the cow deteriorates as she gets older; there can be no question that she requires more food in proportion to her size than she did in her prime, and, of course, there is a continued depreciation in her value for food, for the older she gets the less the sum that will be received from the butcher for her. The ordinary practice on many farms is, therefore, to consider that the animal is best disposed of for beef when she has produced five or six calves. Exceptions are, of course, numerous, and cows of ten or twelve years old, or even older, are sometimes seen in the herds of dairymen who are keen enough business men to be able to justify their practice by the results. Inquiries that have been made from time to time seem to show that the view that there is any rapid deterioration after the cow has reached her prime—say at six years old—is not warranted, nor has it been proved that the milk itself is poorer in quality. The rule to keep a cow as long as her yield is profitable is, therefore, one that can be commended as satisfactory. Particularly should it be followed in the case of an animal of superior quality for there is another point to be considered. While there is never any absolute certainty that a good milker will produce good milkers—there is no certainty about anything in breeding—it is recognised that the milking habit is transmitted, and that a good milker is more likely than a bad one to produce heifers that will take high rank in the milking herd. Now, we believe there is no reason for fearing that the calves produced by a cow late in life are less likely than those born earlier to inherit the good qualities of their dam. There may, perhaps, be a falling off in vigour in the produce of animals in old age, but even this is doubtful, and when the custom is followed of using a young male to compensate for the greater age of the cow, this consideration is not likely to be of much importance. Those who are engaged in the building up of good milking herds would, therefore, be justified in breeding from their best cows as long as possible, and even in straining a point in their favour on the question of immediate profitable return.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

MILKING.

Comparatively few milkers realise the importance of their business. Kindness, neatness, and regularity must be observed, and all the milk must be secured. The cow must be kindly treated at all times; when she is well treated, allowed plenty of palatable food and pure water, and made comfortable generally, she does her best, and sometimes it seems as though she would not if she could. Cows should have no fear of the person caring for them. If you find your cows are afraid of a man after he has been about them a sufficient time for them to become acquainted with him, you may be sure there is something wrong, and that a change of some kind is necessary, and if no other change remedies the matter a change of the man does. This point should be absolutely insisted upon: the cow must be kept clean. When it is necessary to wash the udder and teats before milking, do so. This requires but little time, and is very necessary if we are to have clean milk. The filthiness connected with much of the milking is disgusting to a person who sees the work, and many times it is to the person consuming the milk miles away from where it is produced. Some years ago, Dr. Backhaus, in a report on the milk supply of Berlin, made the statement that the people of that city consumed with their daily milk 300lb. of cow dung. I wonder if we are doing any better class of milk. Promiscuous milking should not be allowed, each milker should have his regular cows to milk, and the cows will do much better for it. There is a great difference in milkers; some do not try to do good work, and others cannot when they do try. There should be regularity in the time of

Cholera Infantum

is one of the Most Fatal Diseases of Young Children

Mothers should look well after their children during the hot summer months, as this is the time of year this trouble is most prevalent.

If any of your children become troubled in this way it will not pay you to experiment with some new and untried remedy.

Get one having stood the test of time. Dr. Fowler's Extract of Wild Strawberry has been on the market for over 65 years and we have yet to hear of a case of cholera infantum it has not cured.

Mrs. S. S. Johnstone, Ochre River, Man., writes:—"About four years ago I gave Dr. Fowler's Extract of Wild Strawberry a good test.

"My oldest son, five years old, got very bad with cholera infantum; two days after my next son took it; and the third day my little girl also took it. I doctored with all kinds of things but they kept on getting worse and the doctors could do them no good. I then started the Dr. Fowler's Extract of Wild Strawberry and after two or three days could see a difference, so kept on with the treatment, but they were so bad it took about two weeks to complete the cure.

Different people have asked me how I saved my children's lives that time, and I always say it was Dr. Fowler's Extract of Wild Strawberry. I am, now, never without it in the house."

Price 35 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

PROUD OF THEIR

SHARPLES

Tubular Cream Separators

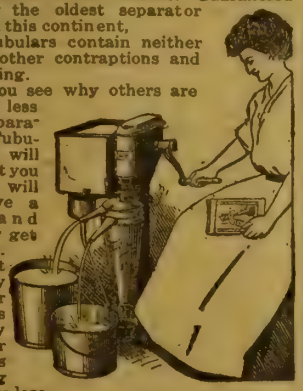
Ask those who are discarding disk-filled and other complicated cream separators for Tubulars why they do it.

They will tell you how much more Tubulars make for them. There is cash value in the fact that Tubulars have twice the skimming force of others, and therefore skim faster and twice as clean.

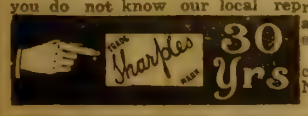
They will tell you of the unequalled durability of Tubulars. A regular, hand-driven Tubular recently finished work equal to 100 years' service in a five to eight cow dairy—and the total cost for oil and repairs was only $1.15. Tubulars wear a lifetime. Guaranteed forever by the oldest separator concern on this continent.

Dairy Tubulars contain neither discs nor other contraptions and are self oiling.

When you see why others are discarding less modern separators for Tubulars, you will realize that you yourself, will finally have a Tubular and had better get it now. You cannot afford any other, for Tubulars repeatedly pay for themselves by saving what others lose.



You can see a Tubular for the asking. If you do not know our local representative ask us his name. Write for catalogue No. 194.



THE SHARPLES SEPARATOR COMPANY

milking. The cows know the time of day, and become uneasy if not milked at the usual time. If a cow kicks, be patient with her; she is hurt, or frightened, or has been abused, in ninety-nine cases out of a hundred. Almost invariably a cause can be found for a cow's kicking when being milked. If, however, a cause cannot be found and removed, it is best to dispose of the cow, as we cannot afford to have a confirmed kicker in the herd; it has a bad influence. When milking, make a business of it, and allow no other business to interfere with it; talking shonld not be allowed. Always milk with dry hands; milking with wet hands is a filthy habit.

A Few Points About Dairy Utensils.

Cleanliness is the first essential point in successful dairying. Troubles in the dairy often arise through the milk being unclean, but in a great many instances it is due solely to the utensils being unclean or unsuitable for the purpose for which they are employed. Unclean dairy utensils are among the greatest sources of contamination of milk by the undesirable species of bacteria. In some cases this source of contamination is due to carelessness in cleaning the utensils, while in others the utensils are of such a nature that thorough cleansing is almost an impossibility. In purchasing dairy appliances and utensils it is essential to get those which have a smooth, hard, nonporous surface, and whose corners are made so that they may easily be cleaned with a brush or cloth. All unnecessary angles should be avoided in order to facilate the cleaning. It is not wise to use utensils made of wood for the purpose of holding milk, as it is likely to get in the pores of the wood, and it is then a difficult matter to cleanse the vessel as it should be done. Glazed earthenware and glass vessels are sometimes used for holding milk and cream. These vessels are easily cleaned, but seldom used on account of the ease with which they break, and their great weight as compared with metal utensils. Tinned metal complies with nearly all the requirements, and is the cheapest, besides being the most practical at the present time. It will be found the cheapest in the end to purchase only utensils of the best quality. These should be made of the best metal, and heavily and smoothly tinned in order to avoid bare iron spots after the vessel has been in use for a short time. As soon as the iron becomes exposed it rusts, forming a honeycombed surface, wherein stale milk lodges and bacteria breed. Zinc or galvanised iron vessels should on no account be used for carrying milk or ripening cream in, as a kind of metallic flavour is often imparted to the cream. Another important point is to be sure that all seams and crevices are filled in with salder, and made entirely smooth. Seamless utensils are generally considered the best, as there is then no chance of open joints harbouring germs. Milk filters should be free from crevices wherein germs may reside and multiply, and a fresh filtering medium should be used each time milk is strained.

The Dry Cow.

The dry cow is usually the one that receives the least attention on the farm. She is, as a rule, getting the refuse of the herd. In the winter she is kept on dry corn stalks or similar feed without grain at all. It is absolutely essential to feed liberally the dry cow, for two reasons. First it must not be forgotten that the dry cow needs feed not only for herself, but also for the foetus. She needs bone building material, to build up the frame work of the future animal. If this dry cow is to be fed during the late fall when pasture is not available, good clover hay or lucerne, if on hand, some silage and a mixture of two parts bran and one of oil meal, about two or three pounds per day, will make an ideal ration for her. Clover and lucerne contain large parts of lime which make bone. The grain feed will keep her digestive system in good condition, which is essential at that period. It will pay to get the cow in good flesh, if she is a dairy cow, and she will return to milk pail every bit of fat she stored up on her loin and rump and round during this dry period. Dry cows cared for in this manner will seldom, if ever, be bothered with retention of afterbirth, will give birth to a vigorous calf in good shape to do a year's work at the milk pail.—Hard's Dairyman.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Dealers Everywhere

Profits From the Individuals.

To put a dairy on a paying basis the individual cows must be profit makers. There is no room for guess work or supposition here. Just as soon as a man depends upon estimates or possibilities he will fail to realize the greatest return from his herd. The success of the whole dairy depends upon the profit rendered by each cow and not upon the profit of the herd as a whole. This is the difference between dairying to-day and dairying 30 years ago. It is the difference between systematic and unsystematic dairying. There are two things necessary in the building ap of a really efficient dairy herd. First, breeding and conformation; second, actual profit producing capacity. Of the two, the latter is of greater importance. There is just one way of determining individual profit and that is through the use of the scales and the Babcock test. These two institutions then become the key that unlocks the door of greater possibilities. They are the standards by which dairy cows must be measured and graded. Those that do not measure up to this standard are unnecessary weights that hold down the productive capacity of the balance of the herd eating a hole into the profits that naturally belong to the dairy man. The unfortunate thing about the dairy industry is that it has been conducted as a side line for so long that farmers do not appreciate the necessity of handling cows that are really adapted to the dairy work. They keep an animal merely because she is attractive in appearance or because they have become attached to her or her family by virtue of the fact that she has been in the herd for many years. In order that a herd may be profitable each individual in that herd must be a profit producer.

LIVE STOCK.

Black Teeth in Pigs.

D. M., Pictou Co., N. S.: Will you please explain in your next issue the cause of black teeth in young, or any age, of pigs? We have eighteen from four sows. They all run together. The age of the little ones is 2 weeks. All the upper teeth are black and some of the lower ones are turning. I am advised to pull the teeth, but they are brittle and break instead of coming out. They run in an alfalfa field and most of them seem healthy, but some have scabby ears, tail and back. What should be done?

Ans.—The cause is not known, and a black tooth does not hurt the pig any more than a white one. The little tusks are sharp as needles, and if they project somewhat they are apt to be the cause of small cuts, and these afford a place for the germs of canker sore mouth to lodge. For this reason it is good practice to cut them off, white or black, with a pair of small pincers. For the scab use a solution of some of the coal tar dips, according to directions. Repeat in a week.

High Temper in Bulls.

High temper is an indication of the prepotent power in breeding. Some of the best sires in the world have been sacrificed right in their prime because they grew ugly, when it would have been well worth while to have borne with them much longer for the sake of the cows they could produce. Such bulls need hard work every day, on the tread power or in harness, to keep down their superabundant energy. Nothing tames high tempered men, horses and bulls, like plenty of hard work.

But we must never forget that the bull is the fountain head. This is just as true in poor qualities as in good. "The other day," says Hoard's Dairyman, "a farmer in this vicinity spoke to us about the bad mistake he made at the start in buying a poor registered bull because he could get him cheap. He said it would have been money in his pocket, if he had paid $500 for a bull that was worth it rather than to have used the bull he did."

Fattening Steers of Different Ages.

James W. Wilson of the South Dakota experiment station has recently compiled data resulting from an experiment to ascertain the gain possible on steers of the same quality, under the same conditions with the same kind of a grain ration, but of different ages.

In recent years expert judges of live stock at some of our principal expositions have given prominent places to the young and immature over the old and more mature animals, indicating that the demand in the market has changed from what it was several years ago.

History shows that early maturity was a desirable character in the origination and improvement of all our principal breeds of beef cattle. This character should not be lost sight of by the breeder of pure-bred live stock. The butchers also have been favoring the well-fatted calf and yearling, until to-day the prices paid for these classes are not much lower than that paid for the older animals that yield larger cuts. In recent years the improved methods of cooking are undoubtedly partially responsible for the increased demand for smaller cuts. It remains to be seen whether the finishing and marketing of our cattle at the younger ages will be come the practice on the high-priced land, where the grains and cattle will be raised in the future.

As an economical utilizer of rough-age, the growing steer has a place wherever the intensive system of farming is practiced.

The following conclusions have been reached in this experiment:

Hogs made more gains following three-year-old steers than when following yearling steers.

The younger the steer the fewer the pounds of feed for a pound of gain.

The loss in shipping per head was greater when the cattle were fed sheaf oats enroute than when they were fed prairie hay.

The largest gain for feed consumed was made during the first thirty days when the steers were put on full feed.

A longer feeding period was required to get yearling steers in good marketable condition than was required for the two-year-old or the three-year-old steers.

More grain was required for a pound of gain during cold than moderate weather, indicating that a large per cent of the feed was required for maintaining body heat.

Deducting the gain made by steer No. 1, in the two-year-old lot of the first experiment, as it was much below the average for the two-year-old steers, only six pounds more gain was made by the three-year-olds than pounds more was made by the two-pounds more was made by the two-year-olds than the yearlings per head showing that practically equal gains can be made by steers of different ages under the same conditions.

When mixed with oil-meal, one-tenth by weight, the three-year-old steers consumed an average of forty-five bushels, the two-year-olds an average of forty bushels and the yearlings an average of thirty-four bushels of corn per head during the feeding period of 127 days.

With the three-year-old and the two-year-old lots a pound of pork was made for every five pounds of beef produced, while with the yearling lots one pound of pork was made for every nine pounds of beef. The production of pork being an important item in steer feeding operations, and as experiments show that it is not profitable to grind corn for steers (unless to increase the palatability), the combined gain of both cattle and hogs should be considered by the prospective feeder.

Falling of the Calf-Bed.

When the accident occurs, the first step should always be to send for the nearest qualified veterinary surgeon, and the next to set about protecting the exposed organ from injury. The best thing is to get a large sized sheet, double it to increase its strength—as the probability is that the "missus" will only part with her house linen with great reluctance, and then with the oldest and rottenest thing she can find—and then pass in under the organ. If the cow is recumbent, and remains quiet, it will only be necessary, while waiting, to cover the exposed organ, but if she remains standing, gets up and down, or knocks about in a manner calculated to cause injury to it, she should be tied up, and one or two men on either side should hold the ends of the sheet, so as to take the weight of the uterus off the cow, while another pinches her across the loins when she strains. If the coming of the veterinary surgeon is likely to be delayed, or other circumstances necessitate an attempt to return it without professional aid, the course of action needs to be quickly decided upon, since the longer the organ remains exposed the more it becomes swollen from the infiltration of serum and the engorgement of its blood-vessels. Supposing the accident to have happened when no one was present, which is very often the case, and especially if the cow was recumbent at the time, the uterus will be covered with dirt and pieces of straw or other bedding material, and in any case will be plastered with dung, which is generally pretty freely passed during the straining. The first step, then, is to wash it carefully with tepid water, to which, if available (as it should be on every stock farm), a little pure carbolic acid or other antiseptic—Condy's, Jeyes' or similar fluid—has been added, until every particle of foreign matter is removed, for to put it back in a dirty state would be to court failure or a fatal termination. If the "cleanse" or any part of it is still adherent, it must be removed, as the efforts presently to expel what has now become a foreign body would tend towards a relapse, by causing continued straining. The maternal and foetal cotyledons must be gently separated by a peeling process with the fingers, so as to avoid causing bleeding. If there is any haemorrhage, or the organ is greatly swollen owing to strangulation or long exposure, cold water should be freely poured over it which will tend to reduce its size. During this cleaning up the organ will, of course, have been as much as possible supported, and this support must be continued during the process of returning it.

THE METHOD OF RETURNING.

How to go about this depends on whether or not the cow is on her legs, or whether she can be got to stand up. If so, her fore part should be stood in a hole dug in the floor under her forefeet, or, if this is not practicable, the hind parts should be raised by banking up under the hind legs with litter, preferably something of a more solid character than new straw. If down, and lying with the head highest, as very commonly happens, the hind parts should be raised and banked up. Some recommend turning the cow on her back and raising her by ropes attached to the hind legs, the free end being thrown over a beam, or attached to pulley blocks. Unless the return cannot be managed in any other way, this plan should be avoided, as being calculated, if the animal struggles, to dam-

When you have a bad cold you want the best medicine obtainable so as to cure it with as little delay as possible. Here is a druggist's opinion: "I have sold Chamberlain's Cough Remedy for fifteen years," says Enos Lollar of Saratoga, Ind., "and consider it the best on the market." Sold by all dealers.

Your dear old tea-cup is to carry a keener delight, a new tea joy to your lips! For into tea flavor—the very essence of tea joy—an even richer fullness, a more zestful vigor has been blended. The result is King Cole Tea With your very first sip you marvel that such flavor-improvement could be possible! It tastes so unusually good. And it never varies, year in, year out.

age the protruded uterus. Having the hind parts highest is a great advantage, since it tends to minimise the expulsive efforts of the cow, and favours the return. It compels the cow to work uphill, and enables the operator to work down. After cleaning thoroughly, and having all in readiness for putting back, pour over it a plentiful supply of carbolised oil, if it be at hand, or grease freely with pure lard or olive oil. Two persons are required in addition to those supporting the corners of the sheet, and these must work in unison. The proper method of manipulating the organ can hardly be satisfactorily described on paper, but no violence must be used, and while the cow strives against the operator more should be done than to endeavour by steady pressure to retain any advantage secured. The difficulty in doing even this much will scarcely be realised by those who have never experienced it. As already pointed out, the effect of the "bearing down pains," or expulsive efforts, can be greatly minimised by having a man to press with the fingers along the spine. In the intervals between the throes as much progress must be made as possible.

In the attempt to return, Steel says:—"The fist must be closed and applied to the fundus of the organ, which must be pressed inward at the intervals between the throes, and prevented from return during their efforts, which must be prevented as much as possible by distraction of the patient's attention and pressure on the loins. While pressure is brought to bear on the fundus an endeavour must be made to return gradually the neck, for a combination of the two methods is decidedly the most satisfactory." By far the best results are obtained, and the cow is saved a great deal of pain, if she can be put under chloroform. Assuming a successful return of the organ, the fist must be passed in with it, and kept there some time in order to guard against a fresh expulsion. A long pear-shaped pessary of hard wood, previously sterilised, is useful for this purpose, and it has the advantage of being longer than the arm and securing a return to its proper position, since before being put back it was, of course, literally inside out. If chloroform has not been used—and it will very rarely be at the command of the farmer called upon to deal with such a case in an emergency—it will be useful to give a full dose of laudanum, but if the cow is in a state of collapse from combined debility, pain suffered, or blood lost, a stimulant may be desirable, and this may take the form of a dose of brandy, whisky, or spirits of sal volatile, if easily obtainable or on hand.

We have next to consider the means at our disposal for preventing a relapse.—Pateley Bridge in Farm and Home.

THE HORSE.

Horse Catching Hold of the Bit.

There are few things more annoying when riding or driving than to have a horse which is constantly catching hold of one of the cheek-ends of the bit with its lower lip and jaw. It is objectionable, not alone on the score that it causes annoyance, but even more so because it interferes with the proper action of the bit. Occurring alike in harness and saddle horses, it is most frequently met with in the latter, the curb of a riding bridle specially lending itself to it, and partly because the more or less severs effect of the curb-bit on the mouth is an incentive to a horse to practice it. Severe biting is unquestionably a leading cause of this annoying habit, owing to the discomfort, if not actual pain, that is inflicted on the mouth. Hanging on to the reins with unduly heavy hands on the part of the rider or driver is, for similar reasons, also a cause, but in many instances the habit is formed without any apparent reason, and, probably, in a spirit of mere mischief. It often occurs in young horses which have just been broken in, and more generally than not is due to the fact that, not yet being properly accustomed to the bit, they fiddle about with it with the tongue, lips, and jaw in a vain endeavour to get rid of it. Some horses soon become great adepts at this trick, and contrive to draw the lower cheek-end right into their mouth and to fix it firmly between the teeth, so that the action of the bit is wholly impeded. It needs a sharp jerk, or more than one, with the rein to free the bit in this case. In extreme cases this getting the cheek-end into the mouth may be a preliminary to an attempt to bolt—bolters frequently bite themselves fast on the bit—but in any case no proper control can be exercised with the bit while it is thus held in the grip of the teeth. More often, when the bad habit is acquired, the horse contents itself with merely catching hold of the cheek-end and letting it go again. If this is less serious than when the cheek-end is firmly lodged in the mouth, it is certainly no less annoying.

THE REMEDY FOR BIT-BITING.

The most obvious plan is to use a snaffle in place of the curb pattern bit; that is a very effectual stop. The ring-snaffle ordinarily used for riding, and the double-ringed driving-snaffle have no cheeks to get hold of, nor is it, as a rule, possible for a horse to catch hold of the cheek-ends of a riding snaffle provided with cheeks—a pattern much used nowadays. It may not, however, be convenient to use a snaffle, for the horse may not be controllable with this kind of bit, and in that case some other remedy must be sought for. If the trouble is caused by severe bitting, or heavy hands on the part of the rider or driver, a cure may be effected by the use of a mild-acting curb-bit. One should select one with very short lower cheek-ends and thick mouthpiece, with but the shallowest of ports in the case of horses used for riding. A "Ward Union" pattern bit, for instance, would do admirably, and the action of such a bit may be rendered all the milder if the bit is hung quite low in the mouth and the curb-chain adjusted very loosely. The use of a chin-strap, buckled as short as possible, will sometimes help. It was partly for this that chin-straps—nowadays so rarely used—were originally designed for use with curb-bits. In many cases they are of but little or no efficiency, but, as keeping the lower cheek-ends somewhat more out of the reach of the animal's lips, young horses may usefully wear a chin-strap on the bit until they have become thoroughly

PROCLAMATION

To The Electors of Canada

"OPEN YOUR EYES" and do not be deceived by the misleading reports published in some of the papers of the Canadian Press claiming that in event of a Canadian navy being established you would be compelled to fight in defence of England should she become envolved in war with a foreign power. These reports are false and were circulated by unscrupulous Politicians to further their own ends in various ways.

"USE YOUR BRAINS" "VOTE AND PRAY" as your heart dictates and refuse to become the tool of any politician "Navy or no Navy" The truth of the matter is this, you will never be compelled to take up arms to aid in the defence of the "Mother Country" should she be threatened by another power, but should the Empire become envolved in a foreign war and need aid "Canadians" would be first to offer their services to the "Mother Land" and fight to the death in her defence as they have done in days gone by.

"LAURIER AND BORDEN"

They may differ regarding the policy to be carried out in building a "Canadian Navy" and the creating of a "Canadian Army" but the "ELECTORS OF CANADA" may rest assured that the only war in which they will be called to take part, will be war against the diseases of the horse. Every man should enlist and fight for this noble animal. The only ammunition you will need with which to fight the diseases of the horse are

used to the curb. In the case of harness horses, the so-called elbow pattern, or "Wimbush" driving-bit, may be resorted to, it having been specially designed to meet the case. In it the lower cheek-ends do not form a straight continuation of the upper portion of the cheeks, as in the ordinary driving-bit, but are bent backwards at a right angle—forming a sort of elbow joint just below the mouthpiece, which places them to some extent out of reach of the horse's under lip and lower jaw, although in some cases horses which have the habit of bit-biting badly soon manage to practice it even when driven in this kind of bit. Some breakers break in young horses to harness in elbowpattern bits, only substituting the "Liverpool" bit, as commonly used, when they have completed their education.

Handling Vicious Horses.

A balky horse can be cured, when under the saddle by a very simple method. Turn him around and around in his tracks a few times and then suddenly straighten his head and he will willingly, and even gladly, go forward. This was the method of the celebrated John S. Rarey and has never been known to fail.

The "jibbler" differs from the balker inasmuch as his so called vice is caused by congestion of the brain. The horse thus affected is liable to bolt or run away after one of these attacks and is a dangerous animal.

Rearing, although commonly termed a vice, is often caused by too severe a curb. Sometimes the rearing horse loses his balance and falls backward. It is needless to say that the rider is lucky if he or she escapes without serious, if not fatal injury. When the horse rears, loosen the reins and speak to him in a soothing tone but if he persists give him a sharp blow between the ears with the butt of the whip. This will bring him down on all fours with amazing quickness.

Kicking is certainly a vice. Sometimes, however, it is caused by fear, in which case much can be accomplished by gentle management. Exactly the opposite treatment of the rearing animal should be applied to the kicker. Hold his head up with might and main, for the horse cannot throw out both hind legs at once when his head is elevated. Kicking straps are what the name implies. A strap fastened to the shafts over the horse's croup prevents kicking, but this is only serviceable when driven in single harness. Shying is a dangerous fault It cannot properly be termed a vice, as it is generally the result of defective vision. Gentle treatment, soothing words and patient persistence in accustoming the animal to the dreaded object will often effect a cure. To lash a horse because he shies or is frightened only aggravates the evil. He will associate the punishment with the frightful object and will fear it more and more each time he encounters it.—From Country Life in America.

Examination of the Horse in Action.

If the examination of the animal while standing has indicated that he is sound, or is serviceably sound, it is then important to see the horse in motion. First, in a walk, then in a trot, and finally in all the gaits. In walking or trotting, he should be led by the halter. Attention should be given to the attendant that he gives the animal's head no support. No whip, shouting or other means of frightening the animal should be used. This examination should take place in the open yard or upon the hard road. If the horse shows some slight degree of lameness when starting, which disappears upon warming up, ringbone may be suspected. If he starts off without lameness but shows some slight degree of lameness after exercise, a splint may be suspected. If the animal seems stiff, but without any definite form of lameness when starting, and then improves, side bones may be suspected. In navicular diseases the lameness is very irregular; the horse may start out all right become lame for a few steps, and then the lameness disappear. In the early stages the most important sign is the tendency to point the toe and flex the knee and fetlock when standing in the stable or at rest. Attention should be paid to the manner in which the animal picks up the feet, whether both hind feet be picked up alike, and whether they be picked up unnecessarily quick or high. Backing the animal will usually bring out this point more clearly than the straight ahead exercise. In mild cases of string halt or spring-halt, this action is only observed upon the start or backing. The feet should be picked up to show how the animal will stand while being shod.

The horse should next be placed in harness, and attention should be given to his behavior while the harness is being fitted. Observe whether he kicks, strikes or bites when the girth is tightened. He should be driven in

Frankness Between Friends.

Says Henry Smith to me one day:
"I got a few short words to say,
The which, I want it undestood,
I'm tellin' you for your own good.
An' so I'll say, most free anj frank
The way you act is something rank!
You drink too much, you smoke, you chew
You swear like common sailors do.
You gamble, too, an' lead a life
Most aggravatin' to your wife;
An' folks is sayin' all the time
The way you carry on's a crime!
I'm telling you for your own good."

Says I to Mr. Henry Smith:
"Since we are just like kin an' kith,
An' since you told me where I fail
An' why I oughta be in jail,
I'll speak a little word or two,
Explainin' what is wrong with you;
The hull of which, its understood,
I'm telling you for your own good.

"First, then," I says, "you're such a cheat,
You swindle every one you meet;
You cheat your anthems in the church
An' leave your neighbor in the lurch;
You seize an' grab by force and fraud
An' call it the 'will uv God.'
In short, to say it brief an' quit,
You're miser, crook and hyprocrite.
You'd rob a baby if you could—
I'm telling you for your own good."

But Henry Smith was very queer;
He hit me just behind the ear.
"Of course," he says, "its understood
I'm sluggin' you for your own good."

Five coppers come up in their cart
An' pried us old-time friends apart;
They took their sticks uv loaded wood
An' clubbed us hard for our own good.

In court the Judge says: "Gentlemen
Don't try to be so frank again;
Be chary of the words you speak,
Lest you be swatted on the cheek.
I fine you ten—its understood
I'm doing it for your own good."

The moral is' don't be too frank;
It gets you nuthin' at the bank.
Just keep your thoughts beneath your hood—
I'm telling you for your own good.—
Berton Brayley.

Love's Barrier.

(Continued from last issue)

A HOUSE OF DEFENCE.

The first thing Helen noticed was the appalling ugliness of the frock Jane wore, the second the beauty and the appeal of her eyes.

Jane on her part saw a lissome figure, exquisitely gowned in something very simple and becoming, a pale clear-cut face, a little proud, and deep fine eyes, looking out from under the brim of a drooping hat. There was no smile on either side. But Jane, after the one glance, took both Helen's hands, drew her close and kissed her. There was motherhood in the act, and Helen gave a little sob, cast a queer quick look of triumph at Secretan, and darted up the stairs. Jane smiled a little tremulously as she turned to greet her brother.

"How very beautiful she is, Claude and how glad I am to see you both!"

"But she's crying, Jane, she's disappointed—something's wrong!" cried Secretan. "I must go to her."

But Jane kept him back.

"Leave her, Claude. I know just how she feels. Leave her, I'll go up presently. What kind of a journey had you? You look well yourself. Isn't this a great day for Midcar?"

"It's a great day for me anyhow," answered Claude, as, oddly dominated by his sister, he moved across the hall to hang up his coat and hat.

"The journey? Oh, all right. We met Mr. Hayes at the junction and travelled with him."

"That would be quite pleasant," observed Jane cheerfully. You introduced Helen, of course?"

"Yes, and they seemed to get on all right. Don't you think I'd better go up?"

"No, dear," said Jane quite firmly. "Come into the study. There are piles of letters. I'll go up presently and see whether Helen has everything she wants. I'm so glad the day was fine, and Claude, there will be dinner presently. Audrey and I thought it out, and we concluded that it would be better to have a little cosy dinner ready. I dare say it is what Helen has been used to."

"Thank you for that. You were quite right, so much depends on first impressions. But Audrey isn't here, is she?"

"No, the carriage fetched her at six. What a dear she is! We've had two splendid days together. I don't think Mrs. Hayes quite liked it, though she sent the flowers from High Ridges to-day. Everybody has been most kind."

Secretan relieved, oddly happy, yet embarrassed, proceeded to the study, and Jane, after another glance at the dining-room table, and a word to Hannah, waiting in a state of trembling excitement in the kitchen climbed the stairs.

She gave a little tap at the door, and having no answer, opened it and walked in. She was not at all surprised to behold her new relative in a heap in the big old easy chair, which had had a new chintz cover in honour of the occasion. She stepped forward quickly, knelt down and drew Helen's hands back from her face. She was not crying, but her face was perfectly white.

"It's going to be all right, dear," she said cheerfully. "You are tired, and it is all so strange! Come, sit up, and let me have a better look at you."

How surprised would Secretan have been could he have heard these words and seen the tender half-whimsical smile on his sister's face! By some strange witchery unknown to him, Jane pushed herself at once into the innermost shrine of Helen's cold quiet heart. She sat up, laughed a little hardly, and laid her two hands on Jane's shoulders.

"Jane Secretan, you are a perfect dear! You are one of the good ones. You ought to hate me. Why don't you?"

"Well, there are two or three reasons—first, I love my brother; second, I don't believe in the celibacy of the clergy; and thirdly, I'm a Christian woman, to whom the vice of hate is forbidden."

"Oh, I hate people frankly, quite a lot of them," said Helen, smiling too. Her relief was so great that she could have cried. She knew that she had been counting on Jane, and that if she had disappointed her, the consequences would have been disastrous.

"You are frightfully good, I know, but not hatefully good. I shall be able to love you, and to say whatever I like to you. I'm so glad; you can't think how glad I am! It's going to save me, Jane!"

"Save you from what?" asked Jane, beginning to take out the buttons of Helen's coat.

"Oh, from all sorts of things. You see, this is rather an awful thing I have done. And unless I'm going to be the square peg in the round hole altogether, you've got to pilot me, be my sheet-anchor, in fact—do you hear?"

"Claude is going to be that, dear," answered Jane a little formally, kneeling to get out the last button from the long wrap.

"Get up, Jane Secretan, and let me kneel down to you. It would be more fitting. Now look at me! I'm not a nice woman; I make no pretensions to goodness, and I've married your brother from a purely selfish motive. I wanted to get away from the life I had been living, which had become intolerable. I don't suppose Claude has told you these things, but I want you to know because, you see, I shall want a lot of bolstering. You must be behind, and beside, and round about me all the time."

"Yes, dear, but now I have seen you I don't believe a single thing you are saying," said Jane with a kind of quiet joyousness. "I don't care anything about the motive of your marriage. We are going to put that behind us, anyway, for ever. It's forward that we are going now, do you hear? Oh, such hair! I wonder more and more that Claude dared. Why, there isn't anything like you in Midcar, nor in the whole of the West Riding, I do believe."

Helen jumped up and looked round the room, seeing it for the first time. Jane had done her best with it, but the bare floor covered with oilcloth, with one rug before the dressing-table and one in front of the bed, had a garish unfinished look. The furniture was a light-coloured wood, bearing the stamp of the cheap emporiums of the Tottenham Court Road; the three foot wardrobe, with the small pane of glass in the centre, stood nakedly against a wall-paper of large design with green and yellow sunflowers climbing on brown sticks. The dressing-table was covered with china ornaments, and a hair-tidy, with an enormous yellow ribbon bow, hung by the side of the swing glass. The only cheerful thing was the fire crackling in the cheap gate of common design, set upon pink and white tiles. All was painfully, scrupulously clean, everything that would starch was starched and frilled and tied with ribbons; but there was not a homely note. Helen inwardly shuddered. Outwardly she screwed a smile and remarked that it was an airy bedroom.

"I cleared out the dressing-room," said Jane, opening a door near the window. "I had been using it as a sort of linen cupboard, but I felt sure you would need a place to keep your frocks in. This is the only wardrobe we have in the house. Claude's things are in it now, but of course, you will arrange it to please yourself."

Helen stepped to the open door and surveyed the small adjoining room furnished with a row of pegs against the wall, a cretonne curtain on a rod, and a narrow dressing-chest across the window. The floor was scrubbed white, and a square of Japanese matting lay like an island in the middle.

"I shall make this into a dressing-room for Claude," she said finally. I shall want my room to myself, and perhaps it will be possible to pick up a decent wardrobe somewhere. Don't let us talk about it now," she said, shutting the door with a rather quick gesture. "Now, what's all this nonsense about going to some farm or another to keep house for some impossible widower? I hope you have explained to him that you are not taking it on."

Jane sat down, watching while Helen pushed up her sleeves and prepared to plunge her hands in the cold water she had poured into the basin. Her every movement seemed to Jane personified grace; even Audrey, whom she greatly admired, and who had all the charm of exquisite youth, seemed gauche and unfinished by comparison.

"It is all settled, and Mr. Courtney is going to fetch me to-morrow afternoon in the wagonette. I thought if we had a little talk this evening, and to-morrow morning I could show you through the house, and where everything is, it would be quite all right."

"It isn't quite all right at all, it's all wrong," said Helen decidedly. I don't want you to go, Jane. Can't you understand that it means something to me, that it will be better for us all if you stop—in fact, that even I may need you desperately?"

Jane shook her head.

Gates' Certain Check.

Nerves Were A Wreck. Could Not Stand The Least Noise

Miss Florence H. Perry, Courtland, Ont., writes:—"I wish to write you a short letter telling you of the help I received from the use of your Milburn's Heart and Nerve Pills. A year ago my nerves were a real bad wreck and was so nervous I could not stand the least noise. My sister had taken your pills and advised me to give them a trial. I took three boxes and saw they were helping me so I kept on taking them until I had used five boxes, and I can say in true words that I am strictly cured."

To anyone troubled with their heart or nerves we would strongly advise them to take a course of our Heart and Nerve Pills as we feel confident that they will do them a world of good.

If your druggist or dealer does not keep them, we will mail them direct on receipt of price—50c. per box or 3 boxes for $1.25.

Sick headache is caused by a disordered stomach. Take Chamberlain's Tablets and correct that and the headaches will disappear. For sale by all dealers.

Exercise and Recreation.

It is a curious fact that, though people are very much concerned and anxious about their health and their good looks, they seldom seem to know that to keep perfectly well they should thoroughly understand the proper way in which to take both exercise and recreation, instead of which they overdo both, with the consequence that they soon cease to enjoy either, and look old and worn while they should be still young and fair.

Exercise should, of course, be regularly taken, or the skin will look muddy and yellow, or become a ghastly and unattractive white, from being shut up in the house and excluded from fresh air and sunshine except at rare intervals.

But there is a certain amount of discretion to be used in taking this exercise, or evil and not good will follow. A walk is an excellent thing but if it is persisted in too long the over-fatigue that follows will entirely do away with all the good that would otherwise have been the result.

You should walk every day that the weather permits, and on which you feel well enough to do so. You should walk at a moderate pace, and never walk too fast or in a violent hurry. Go slowly up hills, and turn home long before you begin to feel at all weary. Remember that it is better to go out twice a day for short walks than once on too long a one.

Riding is one of the best styles of exercise known. But be sure that you start quite fresh, and do not ride too far, or too violently, unless you are in perfect condition. Your horse should never have a hard mouth or the strain on your arms will be very exhausting.

Bicycling is also a splendid form of exercise. But in this you must not try to do too much. It is foolish, and apt to bring permanent injury, to ride far until you have had experience and practice. Your saddle should be of a kind to suit you, and allow you to ride without fatigue or discomfort. If you ride on one that may hurt you, you will soon show the results of the fatigue and pain by looking ill and white.

The use of dumb-bells, gymnastics, and Swedish exercises are all splendid in weather that precludes our leaving the house, and bright eyes and fresh colour in the cheeks will be the happy result of such exercises.

As to amusements, do not carry them beyond the point when they cease to be a recreation. Some people rush from one amusement to another as if their life depended on it, making only a toil of what should be a pleasure.

Recreation, properly managed, is not only conducive to health, but to good looks and spirits. Dancing, for instance, is a splendid recreation, but where a delicate girl is allowed to dance all night in overheated rooms, consequently spending the best hours of the next day in a close bedroom, it ceases to do any good whatever, and she looks faded and dull long before she ought.

Kerosene oil applied to flannel is an excellent thing with which to rub old furniture or clean paint, particularly the dirty finger marks around door handles.

The carpet broom should be washed every week or so in hot soapsuds, shaken well, and hung in the sun to dry quickly. If treated in this way it will last longer than ordinarily, and will sweep the carpets cleaner.

"Late again, Simpkins! How's that!"

"Well, sir, I got up late and only left myself ten minutes to dress."

"But I can dress comfortably in that time."

"Yes, sir, but I wash."

Double the Egg Yield of Your Flock!

The poultryman who has been feeding grain and who starts feeding fresh cut green bone, can cut his feeding costs in two and double his egg yield—to say nothing of being able to raise better table fowl. The

PEERLESS GREEN BONE CUTTER

The Player Piano for Every One

Player-Piano Style 100

The Sherlock-Manning Player-Piano is the key which unlocks for you the treasury of all music. With it, you need no skill or training to render any musical composition perfectly. Two Sherlock-Manning features assure this.

One is an improvement which makes easy the CORRECT playing of any composition, just as a master-pianist would render it. The other is an attachment which allows the performer to accent any single note or group of notes, brings out the melody and subdues the accompaniment at will.

If you are at all interested in Player-Pianos, it will pay you to write for handsome art catalogue and free particulars, as well as the name of a dealer near home where you may test our claims regarding quality and value.

If you do not know the Sherlock-Manning dealer near you, write us and we will gladly introduce you to him or we will give you full information by mail direct. You will save money by writing NOW for our catalogue.

FREDERICTON N. B.

Kitchen Conveniences.

I think, myself, that in farm homes especially, the kitchen should be large and it should also be arranged so as to do away with a needless amount of walking. In dealing with kitchen conveniences I have tried to keep the expenditure for the various appliances which I intend to speak of within the price of an ordinary binder namely $140 or $150. There is hardly a farm—in fact I may say there is not a farm which does not consider the purchase of a binder an absolute necessity, and I think that the purchase of the conveniences which I have to suggest should be considered equally necessary.

WASHING DISHES.

Perhaps 95 per cent of women would say dishwashing is disliked more than any other work.

While south speaking to the women of Illinois I did not give the Canadian West away because there was no object in doing so, but c could not help thinking if they found washing and dish washing so extremely difficult and laborious where they had an abundant of soft water with which to do it, what must it mean to the women on our Canadian prairies where all the natural supply of water is hard, where it is too often limited in quantity, and where the smallness of the buildings preclude the catching of any large supply of rain water. Some sapient soul had remarked that dish washing was really quite pleasant work as long as you were careful to provide plenty of hot, soft water and clean towels. I can still hear the snort of indignation and disgust of that woman when she read this remark. She was having to do dish washing and washing alike with water from an alkali pond. Now the Sanitary Dish Hasher can be purchased for $20. It is very simple of construction and the dishes can all be washed without putting the hands into the water. It also does away, to a great extent, with the necessity of drying the dishes, thereby saving time and also saving in the washing of dish towels. I think I hear some of the women say "Oh, I could never give $20 for something to wash dishes with." I wonder how many of you are giving much more than that in your own health and strength for the doing of this work.

WASHING MACHINES.

Next to the washing of dishes the washing of clothes is the greatest bugbear on the farm. Many of you, I think, now have washing machines, but, so far as I know, very few if any, have washing machines which are attachable to the gasoline engine which are so common on all the larger farms. There is a comparatively new washing machine so constructed that it can be purchased without the electric motor, but with a special belt by which it can be attached to the power of the gasoline engine which is used for chopping feed and like operations on a farm. One feature af this washer is that wrings the clothes as well as washing them and the wringer can be turned in either way. This machine arranged to attach to a gasoline engine costs $32.50.

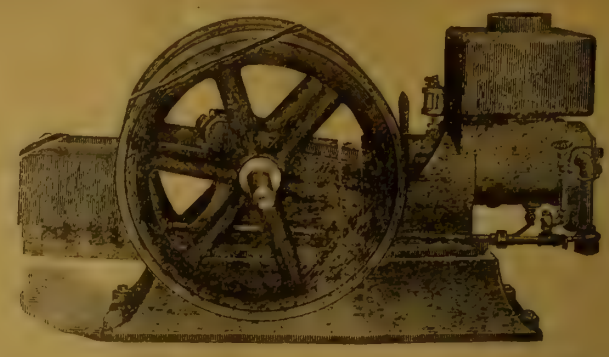
TO STERILIZE UTENSILS.

Put them in cold water and gradually bring them to boiling point, then boil fifteen minutes. Glass cans and tumblers can be sterilized in the same way. They should remain in the hot water till used.

Canning should be done when the air is free from dust. All towels used, as well as the hands and clothes of the worker, should be perfectly clean.

"Dearest, I'v dropped my diamond ring down the bath pipe. You mast send for a plumber."

"No—I'll buy you another ring; it will be cheaper."



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

Sussex Wood Cutters

Made in Three Different Sizes:

Long Swing, Short Swing and Flat Rolling Table Machines

The frame is built of the best seasoned hardwood and braced with steel bars. The table is made of heavy steel plates. The arbor is of the best turned steel and runs in bearings of the best babbit. The balance wheel is a solid web and weighs 180 lbs. These are very important points to consider in selecting a wood cutter.

The distance between the balance wheel and saw in both the Long Swing and the Flat Rolling Table machines is 4 ft. 3 in. The distance between the balance wheel and saw of the Short Swing Table machine is 3 ft. 6 in.

The Machines are fitted with either 26, 28 or 30 in. saws. Each Wood cutter is tested before it leaves the factory.

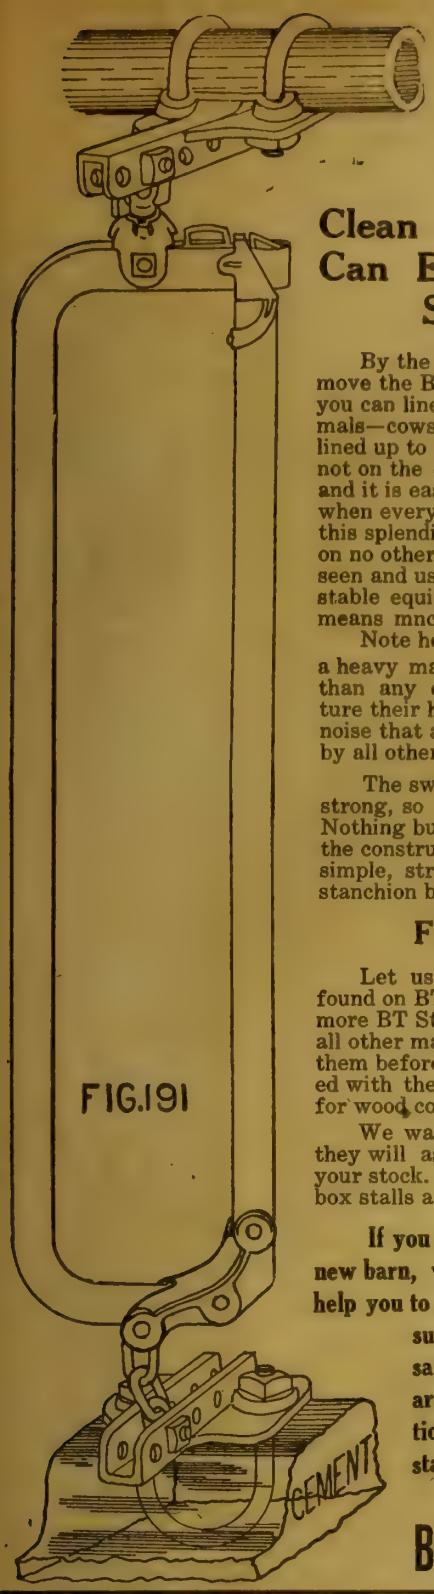

FIG.191

Your Smallest Calf, Your Largest Cow or Export Steer can be tied equally well with BT Stanchions

They are made in five different sizes, and any size can quickly be adjusted to suit a smaller animal. No other line is so complete or nearly so suitable for all sizes of stock.

Clean Cows and Clean Stables Can Easily Be Secured if BT Stanchions are Used.

By the Aligning Device shown in Fig. 191 you can move the BT. Stanchions backward or forward so that you can line up on the gutter different lengthed animals—cows vary in length. When cows are properly lined up to the gutter, all droppings will fall into it, not on the cattle stand. The cows will remain clean, and it is easy to clean out the stable and keep it clean when everything is confined to the gutter. We have this splendid advantage patented, so that it is found on no other make of stanchion. Dairymen who have seen and used it say that it is the best improvement in stable equipment made in many years. It certainly means mnch for better sanitary conditions.

Note how the BT Stanchion is suspended above by a heavy malleable swivel. A swivel is much stronger than any chain attachment. It allows the cows to ture their heads freely without the continual rattle and noise that accompanies the chain-hung stanchions used by all other firms.

The swivel connection we use is very heavy and strong, so that there is no danger of it wearing out. Nothing but the strongest and best material is used in the construction of BT Stanchions, which, with their simple, strong design makes them the most durable stanchion built.

Five Exclusive Features.

Let us tell you more of the exclusive features found on BT Stanchions. There must be reasons why more BT Stanchions are being sold in this country than all other makes combined, and we want you to know them before you buy, for we are sure you will be pleased with them. Our stanchions are especially suitable for wood construction, as well as for all steel stalls.

We want to show you our manger system—how they will assist you in the feeding and watering of your stock. We want to show you how our special box stalls and calf stanchions take care of the calves.

If you are thinking of overhauling or building a new barn, write us. The information we send will help you to get a good sanitary layout. You will be surprised how economically you can build a sanitary stable if BT fittings are used. We are glad to give, free of charge, any information you might wish as to best layout for your stables, or as to best system of ventilation.

Beatty Bros., Fergus, Ontario.

If your stable is equipped with our fittings, it will have the best possible appearance. All cumbersome woodwork is done away with, light and air have free movement through the stable, and with a good cement floor it is practically indispensable. BT Fitings will cut in two time necessary to keep your stable clean.

Fill out the coupon below and mail it to us today, before you forget about it.

Beatty Bros., Fergus, Ont.

The Outdoor Crank.

My neighbour sleeps outdoors, lies out there and snores; and then next day he goes his way, the dreariest of bores. He tells me tiresome tales of how he braved the gales; in peace he slept while torrents swept, and hail came down in pails. The frost was on his nose, and ice was on his toes; he slumbered on until the dawn, serene, though nearly froze. He has a deep disdain for people so insane that they will try to slumber dry, away from snow and rain. This land of ours is free, and men may faddists be; may join the owls and junior. "Better open your chamber Or they may burrow deep where hang on hooks in quiet nooks, or hang on hooks in quiet nooks, gr 'neath the stable creep. But when their sleep is o'er, and they have ceased to snore, they should be drowned if they go round tneir helpless friends to bore.

Hop and Potato Yeast.

One cake of yeast, dissolved in 2 pints of warm tea made from hops; boil 1 Irish potato; rub through a sieve and add to the yeast; work in sufficient corn meal to make a batter stiff as mush. Set to rise; after an hour, if any water rises to the top, stir in more meal. When well tisen, it will crack open on top; now stir in meal to make a stiff dough; make into a long roll, 3 inches in diameter; cut the cakes from the end, each one-half inch thick. Dry in the shade. When nearly dry, crumble, dry thoroughly and put away in a close jar, bottle or paper sack. Use 1 tablespoonful to 1 quart of flour.

If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale by all dealers.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know women's sufferings.
I have found the cure.

I will send, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my friend, [illegible] your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men cannot understand women's sufferings. Why? We women know from **experience**, we know what we suffer. I know that my home treatment is a certain cure for **Leucorrhœa** or Whitish discharge, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or **Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles** where caused by weakness peculiar to [illegible].

I want to send you a complete 10 days treatment **entirely free** to prove to you [illegible] that it will [illegible] nothing [illegible] the treatment a complete trial; and if you should wish to continue it will [illegible] cents a week, or less than two cents a day. It will not interfere with your [illegible]. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send treatment for your case, entirely free, in plain wrapper, by return mail. I will also send free of cost, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanations and advice, telling why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when [illegible] you can decide for yourself. Thousands of women have [illegible] remedy. It cures **all, old or young. Raw Eggs as a Nerve Tonic.

Editor Maritime Farmer:—

"New York society women are at last beginning to learn the value of raw eggs as a nerve tonic," said a trained nurse the other day. "For the last few years I've been trying to get nervous patients to give this simple remedy a trial, but I really think its simplicity was against it. These fashionable women want something expensive, with a wonderful name, and prescribed by some noted specialist who charges a fabulous sum for each visit. When anything is simple, easy and cheap it doesn't stand any chance with them at all.

"A celebrated nerve specialist told me the other day that one could hardly overestimate the benefit from the almost wholesale eating of raw eggs in case of serious nervous exhaustion. Not a raw egg now and then—not a bit of it—but raw eggs tw at a time and at least four times a day! Ten eggs a day are often taken by a patient with most excellent results. This same specialist told me that he had seen the most ragged set of nerves he ever dealt with quieted in a week with this treatment combined with as much milk as the patient could take. An immense amount of pure and highly concentrated nourishment may be taken into the system in this way.—Farmer's Wife, Shubenacadie, N. S.

The Angel of Consolation.

There is a picture called "The Angel of Consolation." A woman sits on the low rocks, looking out upon the sea. Desolation is all about her—not a flower, not a tree on the shore; only sand, rocks and breaking waves. Down in the water her heart's treasures have gone. Her face is stony in its despairing grief. Almost touching her shoulder, hovering over her bowed form, is an angel, white-robed, softly striking the strings of a harp. Does the mourner know how near to her the angel is? Does she hear the celestial music? No; she is dumb unconsciousness, sad and lonely, while God's minister of comfort waits so close, and the notes of sweet music, fall unheeded on her ear.

Is not the picture true of many sorrowing ones? Is it not true, too, of many hungry lives, starving for other blessings? They do not take the gifts that the common days bring. Angels come to them unawares in homely or unattractive disguise, walk with them, and then only become known to them when their places are empty. We do not begin to recognize the worth of even our nearest human friends. With a wealth of precious love, and almost infinite helpfulness, they move beside us along the years; but their garb is plain, and we do not see the splendor that is in them. It would be well were we to pray to have our eyes opened that we might see the common angels God sends to bless our lives.—Catholic Columbian.

Happy Households.

The happiest households are those that do not let die out the sentiment connected with various anniversaries. Although gift giving or recognition of such events in a suitable way may be out of the question, owing to the straitened circumstances of those within the gates, there can yet be a little air of festivity when mother's or father's birthday comes round, or some wedding anniversary is to be celebrated. An extra dish, a little bunch of flowers, or some special music prepared for the occasion, will show the kindly spirit and the loving remembrance that count far more than the money value of any gift.

As the children grow up, if these festivals are encouraged, they will have much to look forward to, and much more to remember in the years to come, when they go out to do battle with the world, and find that sentiment is crushed under foot and affection is regarded only as a side issue.

Life is full of beauty if we only know how to gather it into our bins and storehouses. There need not be great wealth nor worldly honour, but a loyal clinging together of parents and children, marked by happenings that have a direct bearing on each one's individual history, will join the closer together and make home life the ideal thing that it ought to be.

Do not, we beseech you, plead that you are too busy or too seriously occupied with worldly affairs to waste time on such trivial matters as birthday parties and wedding celebrations Such use of time is not a waste, and will prove among the sweetest memories of childhood and old age long after the little chain has been broken, and one member after another gone to that long rest from which there is no awakening.

Ventilation.

Alexander Dumas, the great French novelist, had in his character much of the natural comicality of the negro race, from which he was in part sprung. His son, Alexander Dumas fils, was notably lacking in this quality, and the father was fond of making pleasant little jokes at his expense. Once when the father was vis-

Iron Piping Bargains

We have over 50,000 feet of slightly used piping just as good as new and first class for water, steam, heating greenhouses, construction, fencing, posts, etc., at 25 p. c. to 50 p. c. of less than regular value.

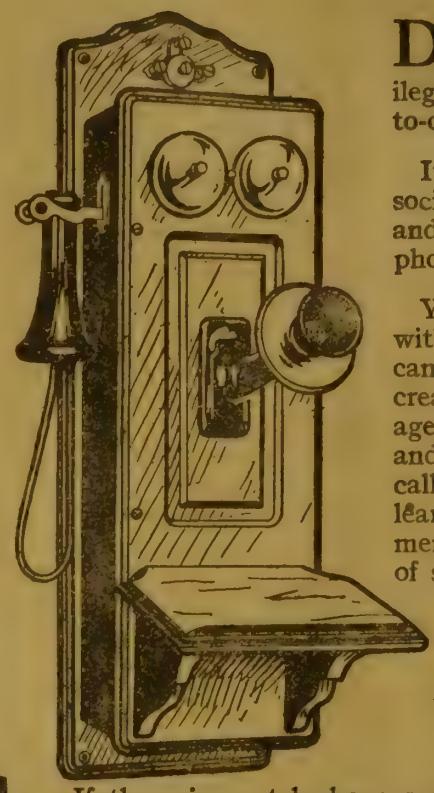
The Imperial Waste & Metal Co. "The House for Bargains and Satisfaction" 105 QUEEN STREET, MONTREAL

Has Your Locality a Telephone System?



DO your neighbors and yourself enjoy the privileges and benefits of an up-to-date telephone system?

It's more enjoyable, more sociable, more business-like, and safer, living in a telephone-served locality.

You are always in touch with your neighbors. You can talk business with the creamery, the implement agents, the stores, the bank and your lawyer. You can call the railway station and learn if an expected shipment has arrived. In time of sickness you can summon the doctor immediately. You can call your neighbors to assist you in case of a fire, an accident, or an unwelcome visit by tramps

If there is no telephone system in your locality send for our famous book entitled

"Canada and The Telephone"

With this book, which shows by means of vivid pictures the necessity of rural telephones, you can quickly promote a local company, and enjoy the distinction of being known as the most progressive man in your locality.

Our Engineers will assist your company or any municipality requiring expert advice in planning construction or solving operation problems. This service is free.

No. 3 BULLETIN

Our new No. 3 Bulletin gives a complete description of our telephones, which are the highest-class on the market to-day. It also tells how rural telephone lines are built, how equipped and how maintained. Write for this bulletin.

SEND FOR FREE TRIAL OFFER

Inquire about our Free Trial Offer, whereby the quality of our telephones can be judged by your company without spending a dollar.

iting the son, Alexander, junior, invited Alexander, senior, into his garden, which is said to have been somewhat larger than a good-sized pocket handkerchief. They sat under the one little tree in this garden, and fanned themselves. "I am suffocating," said Alexander, senior. "What shall I do, pere?" asked Alexander, junior. "Brtter open your chamber window and let a little air out into your garden!" said Alexander pere.

A Word to Girls.

Girls in the country sometimes grow tired of the quiet routine of farm work and for the excitements and attractions of city life. But life in the city is not the public holiday it seems to ?he girls on their occasional visits to town. Believe me when I tell you that working girls in the city have an infinitely more monotonous existence than the country girls ever dreamed of. You get up early and work hard, it is true, but the picnics you attend in the summer and the sleigh rides and parties that enliven your winter give you social recreation and change, while there is always the keenest enjoyment for those who know how to read mother nature's book.

Think of spending every working day in a dingy office, writing and figuring constantly, with but half a day's vacation in three years, as one girl I know of has done. Think of spending all the hot summer days at a sewing machine in a factory with theceaseless clatter of hundreds of other machines all about you! Think of walking two miles to work, standing behind a counter all day, forced to smile and smile, though you feel as a villain ought to feel, and again walking home at night! All these things thousands of girls in big cities do.

One girl I know stands and irons ready-made shirtwaists all day, week in and week out. What is the variety of her life? How would you like to exchange your duties with her? Do you not think it would be a welcome relief to them to milk in the cool of the morning, churn, bake, and sweep before the hottest part of the day; peel the potatoes for dinner out under the shade of a tree, and after dinner is over to sit out in the cool shady yard, or rest in the hammock, or take a canter on a pony; or, in the fall, go to the woods in search of nuts, and at night lie down and breathe in the sweet-scented air of the country instead of amid sewer smells and effluvia of dirty alleys?

How would you like to pay out of your scant earnings for every specked apple or withered peach you ate? Why, if you live in the city, you would pay for fruit that you will not pick up lrom the ground now. How would you like the ever-present possibility of losing your job and having your income cut off for a time, with no money to pay the expenses that always accumulate so fast? Think of those things before you give up the quiet and peaceful life of the country with the certainty of a comfortable home, even if you do.—American Weekly.

Honey is one of the most healthful and nutritious of foods. "A land flowing with milk and honey" meant a great deal to the weary travellers in the desert. Give the children all the bread and butter and honey they will eat, at least once a day, and will never get sick and surfeited from too much sweet as they would if they ate the same amount of jam. If they have a slight cold, cough, or any throat trouble, try strained honey with one-fourth lemon juice, giving a teaspoonful every hour.

Like the lava from the crater
Came the gravy on his plate;
For he failed to tip the waiter,
So the waiter tipped the plate.

$3,600

in Cash Prizes for Farmers

Your Photograph May Win a Prize

AMONG the prizes we are offering in our big Prize Contest is one of $100.00 (Prize "C") for the farmer in each Province who furnishes us with a photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. For this prize, work of every description is included.

Now just as soon as you finish that new silo, barn, feeding floor or dairy, that you've been thinking of building, why not photograph it and send the picture to us? The photograph doesn't necessarily have to be taken by a professional or an expert. In fact, your son's or your daughter's camera will do nicely. Or, failing this, you might use the kodak of your neighbor's son nearby. In any event, don't let the idea of having a photograph made deter you from entering the competition. Particularly as we have requested your local dealer to help in cases where it is not convenient for the farmer to procure a camera in the neighborhood. By this means you are placed on an equal footing with every other contestant. Get the circular, which gives you full particulars of the conditions and of the other three prizes. Every dealer who sells "CANADA" Cement will have on hand a supply of these circulars—and he'll give you one if you just ask for it. Or if you prefer, you can use the attached coupon—or a postcard will do—send it to us and you'll receive the complete details of the contest by return mail.

If you haven't received your copy of "What the Farmer Can Do With Concrete," write for that, too. It's a finely illustrated book of 160 pages full of useful and practical information of the uses of concrete.

Write us to-night, and you'll receive the book and the circular promptly.

Do not delay—sit right down—take your pen or pencil, and fill out the coupon NOW.

The disc drill that can't stall

ANY disc drill economizes seed, time and labor as compared with other ways of seeding. But a FROST & WOOD CHAMPION excels all in accurate sowing, money-saving and the certainty of bigger crop-production. It sows right under hardest conditions.

Built with more strength than it will probably ever need. Continuous steel axle from wheel to wheel, with frame and seed-box solidly attached. Seed-box down low and easy to fill. Tested indexes tell just how much you are sowing. Champion does not compel you to fit the shift-lever precisely into such-and-such a notch. Vary the seed-feed to suit yourself—do it in a second. Champion disc hubs are really dustproof, and are fitted with ball-bearings same as a good automobile. Direct down-pressure on EVERY disc-hub avoids side-strain. No neck-weight on team.

Macdonald Agricultural College praises its CHAMPION DRILL. So do the Experimental Farms throughout Canada Profit by their experience

POULTRY.

Something About Geese.

Editor Maritime Farmer:—

"A team of twenty geese a snow white train,
Fed near the limpid lake on golden grain
Amuse my pensive hours"—Pope.

It has been said the cackling of Juno's geese saved Rome from the Gauls 368 B. C. We are told by early historians this particular kind of goose was a white one as Lucretius says: "the white goose the preserver of the citadel of the decendants of Romulus, perceived at a great distance the odor of the human race." That may be alright, but I am inclined to think Lucretius knew a great deal more about other things than poultry in general and geese in particular. We imagine the geese saw rather than "perceived the odor" and were bent on giving the Gauls a noisy reception after the manner of their kind. Even in the matter of noise one is the gainer by keeping well bred geese since one finds them more tractable, and docile, and not so much given to vocal celebrations.

The most absurd charge against geese and the hardest to kill is expressed in the three-fold indictment 'Geese destroy the pasture, eat everything ahead of them and kill everything behind." Nothing could be farther from the truth. I personally know of a family who keep pure-bred geese and have for many years and the silent partner declares that for time and money expended they realize more for them than any other stock on the place. She says: "Our flock has roamed the pastures twenty-five years, and there is no better pasture in this country." Of course it is understood the goose was intended for the pasture, the hay fields after the hay is cut, where they will do extra well, and not the lawn or around the house—that is after they are grown and ready to turn out. Like the young of all our domestic fowls the gosling needs care, and protection from cold rains. Given this and some judicious feeding until nearly feathered, they will grow and thrive like Mr. Finney's turnips. One thing in their favor as compared with other poultry is their extreme hardiness and freedom from disease, and every gosling hatched from the eggs of an adult goose, means a gosling raised without much trouble or expense. Of what other class of poultry can we say this? It is no use to go into any discussion of the common or mongrel goose as we have proved to our complete satisfaction that they are uncertain, small sized, and generally unsatisfactory. Taking up pure breeds we have five to select from, the Africans, Embdens, Toulouse and White and Brown Chinese. The last two although they lay more eggs than the large varieties, are small, nervous, noisy and the least able to stand cold and extremes of weather, timid and excitable, hard to fatten and hard to pluck. Except for crossing with the larger breeds neither the White nor Brown Chinese are of any value in market production, still they lay twice as many eggs as the large varieties and begin earlier in the season.

The Toulouse goose is a valuable bird, well worth keeping, still as they are the latest of all to mature, they are sometimes called "the Christmas goose" and the flesh is rather coarse grained and not of extra quality. They have a thick, blocky body and rather short legs, so at fattening time when they are in good condition the under parts touch the ground and give them an ungainly awkward appearance.

The big White Embdens carry off the palm for real beauty, with their blue eyes, pure white plumage, orange bill and feet. They are as heavy as the heaviest, and make a fine dressed carcass, that sells better than any other, as the rich, yellow skin gives them a decidedly inviting appearance. They lay the least eggs of any of the breeds, as twenty is a good average, they are later to mate and the first eggs layed are apt to prove unfertile.

Of all breeds I prefer the Grey Africans. I believe for an all round entirely practical bird it would be impossible to find it's peer. He is a handsome bird, has a large head, with a large knob, and dewlap under the throat. These and the Chinese geese are different from the others in the head and are the only two breeds

'Arry and 'Arriet

that have the knob. The bill of the Africans is rather large and stout at the base, and his neck is long. His back is long and flat, breast round and moderately full and he has a large, long and upright body. The wings are large and strong, and are folded well against the body, the thighs are short and stout, and shanks of medium length. The back is dark grey, the plumage of the breast is grey and the under part of the body and the thighs are light grey. A dark stripe runs down the neck from the head to the body. The eyes are hazel; bill, black; shanks, toes and web are of a dark orange color. He has a stately gait and a very impressive air of lordly condescension towards the entire feathered race, and such of the farm animals with whom he happens to come in contact. His neck is long and swan like, and while not unduly pugnacious, "he has a way with him", and any farm yard uprising has his prompt veto. He's a self appointed arbitrator, and settles all disputes by promptly separating the contestants, then goes off about his business "honking" triumphantly. But few resist his peacemaking overtures, but if they do he at once lays his neck to the ground, until it looks for all the world like a serpent about to

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

Two Minute Talks About

PANDORA RANGE

for Coal or Wood

Its Long Life

THE Pandora Range is for those who desire to make a permanent investment. The high quality of the materials and the superior method of construction assure long life.

The *Body* of the Pandora is very heavy. The *Rods* and *Bolts* are on the outside where they cannot burn or rust out. The *Expansion Rings* of the cooking section provide ample allowance for extreme expansion and contraction and eliminate the possibility of the metal cracking.

The *Cooking Top* is *Burnished* which toughens the surface of the metal and increases its strength. *McGlary Oil Cement* is used between the joints. Unlike cheap, ordinary cement, it will not dry out and need replacing. The *Nickelling* will not tarnish and is many times more durable than the single coat of nickel on ordinary ranges.

The Semi-Steel Fire Box Linings are twenty per cent. heavier than cast or gray iron linings. Sulphur fumes, so destructive to cast iron, cannot penetrate the hard, smooth as glass surface of Semi-Steel. The *Grates* have *Three Faces*, which allows the wear to be distributed on three sides, insuring triple durability.

If you want a range of *guaranteed quality* get the Pandora. It's built to give you lasting service.

LAKE OF THE WOODS MILLING COMPANY, LIMITED MONTREAL

strike, and charges. Although I have never in my life seen one of them strike anything on the place, the charge done seems to have all the effect of a blow, for the would-be pugilists "stand not on the order of their going" and seem to forget all their troubles in their eagerness to get out of the way. His voice is quite different from any of the domesticated geese, more like the Canadian Wild goose. As migrating geese often stop in this locality. would be goose hunters have come "honk" but our big African's a bird that could not under any conditions be mistaken for the wild Canadian.

Although they lay 40 eggs on an average, often an individual goose will do much better than that. But the really desirable trait of this breed is the rapidity with which they mature, as they will actually grow up in ten weeks. In handling these geese we have been surprised and pleased that they show so little disposition to resent our efforts to regulate their movements, our 'Arry and 'Arriet will patiently submit to any amount of handling, even lifting 'Arriet from her nest without any hostile exhibition. 'Arry has proved an unfailing source of amusement, although he's enormous and quite a "load" I can pick him up and stroke his long velvety neck, and far from resenting it, he seems to enjoy it. He's certainly an exemplary bird, and knows his name as well as we know our own—go out anywhere in the fields and call "'Arry", be sure he will respond with an answering "honk". While by no means an old bird, and no one can tell how his temper will stand the test of time, if kindly treated I have no doubt he will live and die a courteous gentleman, and a good husband to the worthy 'Arriet.

A phrase that seems to me absolutely without point is the one by which everyone who makes a foolish or short-sighted move is called a "goose." Why such undesired odium should be allied with the name of a

OPERATION HER ONLY CHANCE

Was Cured by Lydia E. Pinkham's Vegetable Compound

Lindsay, Ont.—"I think it is no more than right for me to thank Mrs. Pinkham for what her kind advice and Lydia E. Pinkham's Vegetable Compound has done for me. When I wrote to her some time ago I was a very sick woman, suffering from female troubles. I had inflammation of the female organs, and could not stand or walk any distance. At last I was confined to my bed, and the doctor said I would have to go through an operation, but this I refused to do. A friend advised Lydia E. Pinkham's Vegetable Compound, and now, after using three bottles of it, I feel like a new woman. I most heartily recommend this medicine to all women who suffer with female troubles. I have also taken Lydia E. Pinkham's Liver Pills and think they are fine."—Mrs. FRANK EMSLEY, Lindsay, Ontario.

We cannot understand why women will take chances with an operation or drag out a sickly half-hearted existence, missing three-fourths of the joy of living, without first trying Lydia E. Pinkham's Vegetable Compound.

For thirty years it has been the standard remedy for female ills, and has cured thousands of women who have been troubled with such ailments as displacements, inflammation, ulceration, fibroid tumors, irregularities, periodic pains, backache, indigestion and nervous prostration.

Flavor

in tea must be distinctive, pleasing and unvarying to merit continuous use. The flavor of Red Rose Tea is all its own; and it never fails to win and hold approval because it never fails in quality. Try it.

92

FLORICULTURE.

Reader, Chatham, N. B. , Writes:—What care does a Tuberous Begonia require after it is done blooming? Mine seems to be growing thriftily. Will it bloom again this Winter, if I let it grow? Is wood soil the best thing for a Sword Fern? I have a large one that requires repotting, should such soil be sifted? Does a Sword Fern require much sunlight and moisture? There are some little plants growing up near the edge of the pot, could they be separated without hurting the old plant and should they be potted or put in water to root? Is there any way to tell a double Begonia from a single one before they are in bloom?

As soon as the Tuberous Begonia is done blooming it should be dried off by gradually withdrawing water, and placed in dark, cool quarters until Spring, allowing it to remain in the pot. If you wish to use the pot it can be taken out after the soil is thoroughly dried and wrapped in cotton wool. This will help to prevent it's starting too early. If allowed to grow all Winter the bulb is apt to be seriously injured. Wood soil, if not sour, is a good thing for some Ferns but I do not think it is necessary to procure it for Sword Ferns. as a good garden soil, if not of a heavy nature, is just as good. I do not advise sifting soil for potting plants but of course all sticks, stones etc. should be removed. The Sword Fern will do well with little sunshine if it has plenty of light, and it certainly likes plenty of moisture, if applied to the soil at the top. It is very impatient of water in the saucer and such careless treatment is apt to cause the leaves to yellow. The little plants may be dug out carefully, leaving as much roots as possible on them. They should be potted in small pots and kept moist and free from sunshine for some little time. I do not know any sure rule to tell a doubled flowered Tuberous Begonia from a single flowered one when not in bloom. The single varieties are apt however, to be of a more rank, strong growth than the double but this is only guess work after all.

All bulbs and hardy roots should be planted at once as we are apt to have the ground frozen by the middle of the Month. Don't hurry about covering your bulbs, wait until the frosts are heavy and don't cover rose bushes until the leaves are off, as they are apt to mildew if much foliage is tied up closely.

Calla Lilies can be left out in the garden in the shade until the last of August, when they should be potted up in the same sized pots, all old soil being removed and plenty of drainage and good rich soil used instead.

If you want good Dalhias during the Fall months water freely even if the plants look healthy and strong they must be watered to give size and color to bloom. The larger the plants the less water gets to the roots during a shower and often the garden may look quite wet while the earth about the Dalhia tubers would be dry so do not be afraid to water.

Salisbury Correspondent, Writes:—Last year I cut my Rubber plant down. It had grown as high as the ceiling of the room. I made two cuttings and tried to make them grow but they both died. Now on the old stalk there are two new shoots and what I want to know is if I can take these shoots off the old stalk and make them grow? If so, how will I treat them? Shall I take them off this month or later?

We usually root cuttings of this plant by taking the tips and placing them in sand in a box on the heating pipes thus giving them bottom heat. They might possibly be rooted in a box or pot of clean sand if kept constantly moist in an even temperature of sixty degrees. To do this requires some care. Another way, although old fashioned, might suit you better: Get some Coarse Wood Moss, or better the long sphagnum or swamp moss and make an incision in the branch you wish to root—a small cut will do—about this tie a large handful of the moss quite tightly and saturate thoroughly with water and keep constantly moist. Once a day would be fatal to your hopes. This will ordinarly cause roots to form at the incision and when they become quite distinct you can cut off the stem, below them and pot in soil keeping moist and in the shade for a few weeks.

If anyone wants a plant that they "can't kill" get an Aspidistia, commonly called Parlor Palm. The varagated variety is the prettiest. It is certainly very hardy and will stand a lot of neglect.

A VERY DESIRABLE FEATURE FOR SOME HOUSEKEEPERS

A Writer wants to know if we will kindly state the care and culture of Roman Hyacinths and Narcissus bulbs for home use, also would it be advisable to keep them in a dark cellar—where there is a furnace in one corner? Have you all kinds of bulbs?

The usual procedure in handling Hyancinths and Narcissus bulbs is to pot up the bulbs, as soon as they arrive and often watering them so thoroughly that the soil and pot are wet through then they may be placed in a cool, dark cellar where there is no furnace heat and covered slightly with soil to prevent them from dripping out.

S. S. T., Writes:—I am a grower of fine Asters and have tried many times, without success, to save my own seed from extra fine blooms. When should Asters be cut for seed and how should they be treated?

Allow the Aster blooms to remain on the plant as long as possible without their falling to pieces then cut and dry and rub out the seeds.

CHRYSANTHEMUM, THE FLOWER OF THIS SEASON.

The trouble mentioned is one of the weak points of that good old variety of Chrysanthemum, Major Bonnaffon, and probably arises from wilting the blooms and especially from allowing them to remain wet over night or in too close and moist an atmosphere.

I. C. R. Time Table for the Coming Winter.

The Fall and Winter Time Table of the Intercolonial Railway will go into effect on October 29th. There will be practically no departure from the time schedule of last winter. The Ocean Limited will be discontinued until next summer, and the through service between Halifax, Sydney, St. John, Moncton and Montreal will be performed by the Maritime Express which will leave Montreal at 12.05 and arrive at Halifax at 17.15. The night express between Halifax and the Sydneys will be continued for the present. No. 3 and 4 Expresses between St. John and Pt. du Chene will be discontinued.

Here is a woman who speaks from personal knowledge and long experience, viz., Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is far superior to any other. For croup there is nothing that excels it." For sale by all dealers.

Louden's Litter Carrier

Men and boys like to chore when equipment is modern and satisfactory. The day for pitching or wheeling the manure out of the stable is rapidly passing.

Install a Litter Carrier and do your work better and more quickly than before. Louden's Litter Carrier will work in any stable.

Send us a plan of your stables and let us quote you a price. A free catalogue for the asking.

LOUDEN MACHINERY CO., GUELPH, Ont.
Hay Tools, Cow Stalls and Stanchions, Barn Door Hangings Feed and Litter Carriers, etc.

This Man is Young at 55 Years.

He is a "Health Belt Man;" therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life---be a "Health Belt Men" yourself---it gives manly strength; it makes you young and keeps you young all the days of your life; it takes all the coward out of your make up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you?

The secret of life-long youth may be summoned up in one wodr—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none. Just the Health Belt. No privations, no dieting and no restrictions excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed: let it send its power into your nerves, organs and blood while you are s eeping. It gives you a great flow of soft, gentle galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the mornings greeting with 'I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three month's use is sufficient. S. Coolen, Hubhards- Cove, N. S. writes: "I am a man again, thanks to you. Nothing can discourage me now."

This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Nature Cure Books FREE

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

DR. M. F. SANDEN Co., 140 Yonge Street, Toronto, Ont.

Dear Sirs—Please forward me your books, as advertised free.

Something About Geese.

(Continued from page 25)

handsome and stately bird is beyond my comprehension.

A more valuable addition to the farm family would be hard to find. In support of this I will give the experience of Mr. William Rankin and several others. Mr. Rankin is the original Pekin duck man and in his home Western Mass. raises many thousand every year. In speaking of his experience with geese Mr. Rankin says: 'I once let a pair of old Africans run separately and fed them liberally to see the best they could do. The goose layed 51 eggs and I raised 37 goslings. A horse got loose and killed one, one died, leaving 35 for market, these I sold for $81.47. One goose" said he, "gave me more profit than a cow and two hogs. And a neighbour of mine did even better the same season."

Mr. Samuel Cushman who at one time conducted the experiments with geese at the Rhode Island Experiment Station is authority for the following: "He knew a farmer" he writes "who had one year 37 sheep, ewes, from which 37 lambs were raised, and sold at $5.00 each, $185.00. He informed Mr. Cushman that the same season ten geese payed better and ate less.

Another successful "goose man" said every one of his female geese payed him $20 each and he was going into goose raising more extensively.

The facts given above, are by no means exceptional, but merely what one can reasonably expect from the pure-bred geese.

I want to give the experience of a friend who bought a trio of common geese from an Island some two or three miles south of us, where the inhabitants have engaged in goose raising on a small scale for many years. One of the females was an old well matured bird. With these two females she succeeded in raising five goslings. These birds were hard to control and would fly out to sea and sit on the water all night like a gull. When the fall gales began to blow these birds were beaten away from their home island, and carried south by a storm, where they beat up in the surf on some out lying islands, and not one survived. In addition to this habit of "putting to sea" every night they had acquired another equally deplorable one—that of picking up fish offal and refuse to be found about the beaches, by which the flesh was badly tainted, so much so that the market geese from the island from which these breeding geese were purchased, are very hard to dispose of, as they are known to be "fishy" and unpalatable. What a loss to keep such stock, as a man who used to keep a flock in that island told me a goose at her best lays but 15 eggs, and the finest adults won't make more than ten pounds dressed, and rarely that. These birds can be bought in the fall for one dollar each, but knowing the performance of the pure breeds, who would not rather pay say an extra $1.50 for such stock, as they would make it back to their owners in extra weight many times over.

We paid many times the price given for our breeding stock, and would not consider an offer double the amount, in fact we would not sell them at all, and it's not merely that they are so profitable either, because we take an interest in them, and would miss their friendly clatter, as they stalk around majestically by far the most interesting and handsome things on the place.

I am sure as the seasons go by we have made no mistake selecting this breed. Again listen to Mr. Cushman who raises all the pure-bred varieties. African geese are large as the Embdens and Toulouse, lay more eggs than the Embdens and as many as the Toulouse, and they lay them nearly as early as the small Chinese varieties. They are prompt to mate, and gander will mate with more geese, and their early eggs will be more fertile than those of any other large breed. They are steady, docile, and great feeders. Goslings grow faster up to the time they should be marketed and are easily fattened. If you have ten females of Africans, Embdens and Toulouse, with the proper number of ganders on your place and give them the same chance, you will have after the hatching season is over, many more African goslings than either Toulouse or Embden. Probably three times as many Embdens will be secured as Embdens and twice as many as Toulouse—Taken alone or pure-bred they are the most profitable of all breeds.

The best authorities agree that breed stock should be secured in the fall that they may be used to their new quarters, and be contented and well mated before the breeding season opens. That they should be well mated is very important, because geese mate for life and become much attached to their mates, and will not readily change.

Female geese have been known to live and be profitable as breeders up to the fifteenth year, although ten is about the average. As this is the case 'twould seem to be of greater importance to secure good stock. In getting mongrel stock it may be a little saving on the start—but remember the result will be cheap, so cheap that you will probably give up the experiment as too cheap to be worth the time and attention. I think it's because of this inferior stock that one finds such a strong prejudice against geese in some quarters. But the right stock handled intelligently is the most profitable and interesting of all the feathered tribe.—Sarah E. Moses Smiths, Woodwards Cove, Grand Manan, N.B.

AN OMMISSION.

At the recent Chatham Exhibition Mr. James Retson, Truro, N. S., had the first prize Black Minorca Hens, first prize White Wyandotte Hens and first prize White Orpington Hens. This enviable record was inadvertedly ommitted from our list of awards n last issue.

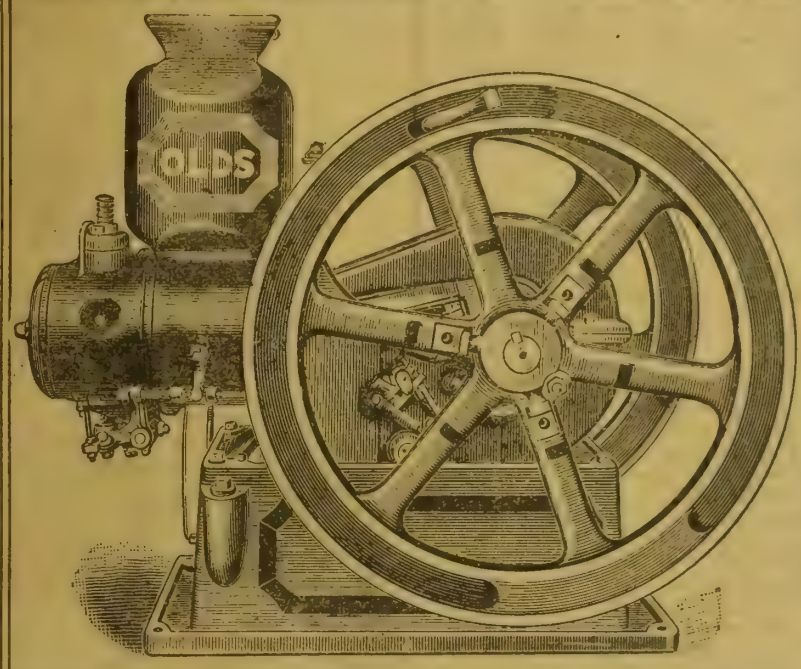
Examination of the Horse in Action.

(Continued from page 17).

his accustomed manner, single or double if a driver, and to the cart or wagon if for heavy work.

The rein should be taken to determine whether he has a hard or tender mouth, and to note his manner of responding to the pull. Also observe whether he shies or frightens at strange objects when being driven. If at the sale stable and the animal behaves rather strangely when hitched to the cart, one should be certain that this is not due to improper fitting harness before rejecting him. A tight fitting collar may make the difference between a proper acting animal and one that is wholly objectionable. The wind should be thoroughly tested for whistling, for roaring, and for heaves. The ear of the examiner should be put to the nostrils, to the throat, and to the side of the chest and the hand placed upon the flank to detect any unnatural sounds or jerking in breathing.—Indiana Exp. Station.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole Sale Representatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Makes Pigs "Stay Put"

The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 12

New Brunswick Wire Fence Co., Ltd. Moncton, N. B.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

REMEMBER! Reeves Munroe, Consulting Electrical Engineer, Taymouth, N. S.

HONEY.

Display of Liquid Honey—1, Harry Newsome.

Raise Your Calves Without Milk.

Experience has shown that it is impossible to make a satisfactory substitute for milk out of cereals, hay-tea, oat-meal, porridge, etc. A satisfactory substitute for milk must, as a matter of course, resemble new milk as nearly as possible in chemical composition, it must be well balanced, it should be a complete food, and most of all it must be easily digested and assimilated by the tender stomach of the young animal.

BLATCHFORD'S CALF MEAL has now been on the market a very long time, it has been thoroughly tested and tried and we understand that it is well cooked and prepared for digestion and from the extent of the business and from the testimonials received showing the satisfactory results obtained from feeding it, we recommend our readers to give it a trial.

Messrs. A. A. Archibald & Co., Truro, N. S. will procure a valuable pamphlet for the farmer entitled "How To Raise Calves Cheaply & Successfully Without Milk" and every farmer should have one. It tells how to raise 3 calves at the cost of 1, avoid scours and keeps calves healthy and fat. Tells how to veal calves at about ½ the usual cost, how to save the milk and in fact how to make more money out of calves than you ever thought possible.

The Manufacturers have been selling to and dealing with the Farmers, Stock Owners and Poultry Raisers for over 100 years and their business must be well established in the good opinion of their customers.

Renovating an Old Alfalfa Field.

My alfalfa was badly killed out during the severe winter of 1909 and 1910. I took off the first crop, a thin one, and then cultivated lengthwise and crosswise with a diamond tooth cultivator. When the diamond tooth cultivator is used few plants will be destroyed. I then seeded with 12 pounds of seed to the acre.

This alfalfa field was free from weeds, and had been seeded the previous spring. An alfalfa field could not be renovated in this manner if it o old and weedy. The best method of renovating such fields is to plow and re-seed.—Hy. Glendenning in Farm and Dairy.

For Sale--Ayrshires and Guernseys.

My Ayrshire Bull is imported, his dam had a record of 12,840 pounds, testing 3.9 in 45 weeks. A number of young Ayrshire Bull calves, females any age.

I am still a breeder of Guernseys, and have a few aged cows that I will dispose of.

Chester White Pigs. I have several that are ready for delivery from 4 weeks upwards, both sexes. Correspondence solicited.

We Send this Book Free On Request—Use the Coupon

YOU only need to look at the contents page of this book to see how complete and comprehensive it is. In all the hundred pages between its hard, cloth-bound covers, there is not one single superfluous word--nothing but a carefully indexed mass of necessary information. There is no other book in existence that deals so thoroughly with every vital, essential fact--that so clearly tells the farmer

"How to Build Rural Telephone Lines"

When you get this book, read it over at least twice. You will need to do that to assimilate the information it contains. No matter in what phase of the work you are interested—whether you want to know about telephone company organization, whether you want to know about the actual construction of the line, whether you want to know what other community-owned telephone companies have done, or whatever it is you do want to know, you will find the facts set forth in detail in this book. This volume has cost a lot of money and careful study to prepare and we really ought to charge for it. As long as the edition lasts, however, we will send it **free,** but only to those who, by asking for it, signify that they are really interested. Are **you** interested? If so, clip the coupon, fill in your name and address and mail it to us today.

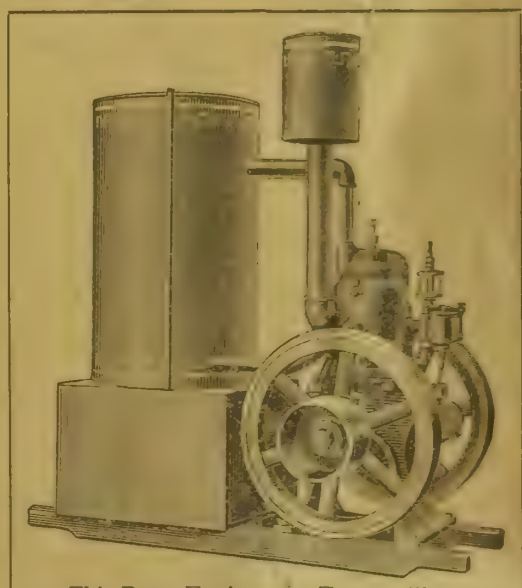
Page Work Engines

Since our first advertisement appeared a month or so ago giving particulars and prices of our engines, we have had many orders. People seem to readily realize that they cannot afford to go without an engine at prices we make—a 3 1-2 horse power at $138. or a six horse power engine for $188. The engines use for fuel either gasoline or kerosene. These engines are powerful but light and can be carried from place to place where work is to be done.

You may be wishing you had an engine to help you do your work, but may be unfamiliar with engines and have an idea that a gasoline engine is an uncertain, complicated thing. If you think so your fears are groundless, for gasoline engines are so developed nowadays as to be just as reliable as any other machine. Anyone can operate a gasoline engine, as there is no danger. No engineer is needed. There is nothing to blow up. Simply put gasoline or kerosene in the fuel tank and give the fly wheel a turn and away she goes for all day. Go off and leave it if you want to. It is safe.

A gasoline engine is started instantly. You do not have to wait to get up steam. When you are through work stop the engine and, and consumption of fuel stops at once. Hence, you can run the engine for only ten minutes, and you use only the fuel required for operating it that length of time.

As to cost of fuel, a Page engine uses only 7-8 of a pint of gasoline or kerosene per horse power per hour. Hence, if you were operating our 3 1-2—4 horse power it would use less than 1-2 gallon per hour, which at 15c per gallon would cost you only about 7 1-2c per hour. Probably you would not work the engine to its limit and fuel would be less accordingly, for a gasoline engine uses fuel only in proportion to the work it is doing.



This Page Engine on a Farm will pump, saw wood, run a cream separator, washing machine, churn, silage cutter, fanning mill, root cutter, grindstone, etc. It may be easily moved from one place to another, and is always ready to run. It does the laborious and tedious chores of the farm.

We are getting many orders from the Maritime Provinces, especially from Prince Edward Island, although Nova Scotia and New Brunswick are not far behind. Dealers find the Page engines a good line to handle as they are so low in price and so high in quality. We are getting so many applications for agency that we hope to have a thorough organization in the engine branch of our business in the near future.

Marine Engines

We have in above referred particularly to stationary or work engines. But we are also supplying marine engines from 2 to 36 horse power. Catalogue of either style on request.

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education—It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

AGRICULTURAL COLLEGE, TRURO, N. S.

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course Begins November 1st, 1911

Next Shourt Course for Farmers and Farmers' Sons Begins January 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies Begins January 2nd, 1912

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have not had an opportunity to acquire a high school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Argicultural Colleges. For full particulars apply to—

The Farm Labor Problem

The two great problems on the farm to-day are time and labor, especially at this time of year when you are gathering in your crops and preparing for the winter months. Wouldn't you welcome a machine that could work away all day, doing your tedious jobs, such as running a cream separator, threshing, cutting corn or pumping water and sawing wood. This is what a

FAIRBANKS-MORSE GASOLINE ENGINE

will do for you, being built for such service and has proved this to over 112,000 users, affording them cheap and reliable help at all times, and any season. Our engines for out-door work are made to run in the coldest day as well as the hottest. Take up your pencil and fill in the coupon and mail it to M

Paint and How to Use It

PAINT HAS VALUE

I do not believe that the value of paint as an asset is even yet fully recognized by the people who use it. A prominent paint manufacturer used to advertise, that "good paint costs nothing, because it saves more than it costs." This is the fact which is oftenest forgotten—that paint not only freshens and beautifies our surroundings, but that it also protects the surfaces to which it is applied and saves them from decay.

It does more than this: It promotes general cleanliness and thrift. If the painting is regularly attended to on the farm, we may be pretty sure that other things will not be neglected. After the house is painted, other shortcomings are apparent and a general slicking up naturally follows. Furthermore,

The Champion Herd at the 1911 Nova Scotia Provincial Exhibition.

Winners of the Silver Tea Service and Tray donated by the Merchants Bank of Canada, F. M. Scarff, Manager Halifax, N. S. for the best herd any breed, consisting of 1 bull, 4 cows, 3 years old and over and 4 heifers, over one year and under 3 years. Awards made on the basis of 75 per cent for correctness of type and 25 per cent for show condition. Owned and exhibited by McIntyre Bros., "Sprig Brook Farm," Sussex, N. B.

Paint may be bought in two forms—as a heavy paste, consisting of white lead in oil and colors for producing the desired tints; or as prepared paints, ready for use.

Prepared paints can be used by anyone who will carefully follow the printed instructions accompanying them: though with them also the practical painter's superior knowledge makes it well worth what it costs to employ him.

There has been much discussion of late as to the best season for painting. I prefer the early fall months and my own painting is always done during that season. The reasons for this preference are: 1. The atmosphere is dry and the surfaces are in proper condition. Moisture is fatal to new paint. It causes blistering, peeling and cracking. 2. There are no insects blundering about and sticking to the fresh paint. 3. Cold weather is better than hot weather for new paint. The new paint hardens slowly during the winter and by summer is ready to stand any weather. Paint applied in the spring is likely to be baked and blistered by the sudden advent of hot weather. 4. Painters for some inscrutable reason are usually more amenable in the fall than in the spring and will better heed advice to give plenty of time for drying between coats.

A safe rule is to paint only on dry surfaces in dry weather, and to allow a week between coats. If this rule be followed and an excess of dryer avoided, satisfactory work can be done at any season when the thermometer does not fall below 40 degrees nor rise above 80 degrees.

It is harder to get good results on modern lumber than it was on the lumber our fathers knew. That was chiefly clear white pine, well-washed out during the long journey of the raft to the saw mill, and air dried for months or years before it was sold. We pay the penalties of progress just as much as we profit from its advantages. There is little white pine left and that little is not good and is ill-prepared for painting. Mostly we see yellow pine, cypress, etc. These two are abominable woods to paint, the yellow pine because it is uneven and full of rosin, the cypress because it is hard and greasy. The paint must be tempered to suit the lumber.

When about to paint a new house, we first examine the surface. If it is soft and absorbent, the paint is made very thin for the first or priming coat. If a ready-for-use paint has been selected it must be thinned with about two quarts of pure raw linseed oil and one pint of turpentine to the gallon of paint as applied. If the lumber is hard and nonabsorbent, like oak, chestnut, maple, etc., the priming coat must be thicker. For such woods one quart of oil and one quart to three pints of turpentine will be a sufficient addition to the gallon of paint.

Yellow pine and cypress require special treatment. It is best to allow them to weather for six months or more before painting at all. When ready to paint yellow pine all knots and resinous streaks should be given a coat of shellac varnish. The priming coat should then be prepared as for hard-wood, except that there should be a little more turpentine. The priming coat for cypress is the same as for yellow pine.

The trick in priming is to spread the paint out well and to work it into the wood. This coat is the foundation, and if it lets go the job is ruined. The necessity of working it well into the pores is self-evident.

The priming coat, if properly mixed and applied, will dry with a "dead" surface—that is, without gloss. The next coat will adhere to such a surface far more firmly than to a glossy surface.

After the priming coat is thoroughly dry, which will be in three or four days (best to give it a week), all nail holes, etc., should be stopped with putty, preferably colored to match the paint, by working into it a little of the paint itself. The best putty is cheap and it does not pay to economize on this item.

The treatment of the second coat depends upon the number of coats decided are absolutely necessary for good results, though a single coat is often made to suffice, from false ideas of economy. Three coats of paint properly brushed out are together but little thicker than tissue paper, which is certainly thin enough, considering the service required. It is a proverb among paint men that "three thin coats are twice as efficient as two thick coats."

If, however, two coats are the limit, the finishing coat should be as it comes from the can, applied with a full brush and spread evenly, and smoothly, brushing first across the boards and then lengthwise.

If three coats are used, as is proper, the second coat should be thinned with only enough turpentine to reduce the gloss, about 1½ pints to the gallon of paint will usually suffice. This coat should be well brushed out. A full week should be allowed for drying. For the third, or finishing coat, the paint should be applied as it comes from the can, unless found too thick for smooth working, in which case a very little raw linseed oil may be stirred in. This coat should be applied with a full brush, well brushed out, and finished by lightly brushing lengthwise of the boards.

Repainting over old paint requires judgment. The surface is carefully examined as to condition. If the old paint has peeled or shows signs of letting go, scrape off with a steel scraper as much as can be detached and sand-paper the worst spots. If the old paint is dry and absorbent, thin the new paint, as for second coating with oil and turpentine, and finish with a second coat of the paint as it comes in the can.

If the old surface is in fairly good condition, firmly adherent and not very spongy, use the new paint as directed for third coating on new work.

The choice of tints and colors is largely a matter of taste and training; but there are certain rules of universal application and certain practical considerations which should be taken into account.

The first of these practical considerations is the fact that the darker shades, all things being equal, wear better than white or light tints. This is an unfortunate fact, but nevertheless a fact.

The second fact is that a tint usually wears better than the white paint from which it is made. A prominent painter, after inspecting all the tests to which reference has been made, remarked, "It is a curious fact, that the addition of small quantities of almost any old thing to pure white lead seems to improve it." This is a hint from a practical

man worth bearing in mind.

The general rules for the selection of colors are:

1. Light colors for a dark or shady situation; darker colors for the full glare of the sunlight.

2. Light colors increase the apparent size of a building, dark colors decrease it.

3. Startling contrasts—as of green and purple, blue and yellow, red and blue, should be avoided or very sparingly introduced.

4. The general color scheme should harmonize with and should be governed by the character of the building, its architecture and surroundings.

A volume might be written, volumes have been written on this subject, so it is hopeless to attempt to cover it here. One of the most practical and helpful booklets of this sort available is the little illustrated pamphlet, issued about two years ago by the Paint Manufacturers Association, under the title "Fashions in House Painting." It contains some 14 or 15 color schemes suited to houses of various types, and was prepared for the association by a representative committee of painters and architects. Anyone can have a copy for the asking, and I could not hope to improve on its suggestions.

As the end of all this advice and explanations, I would say, select a paint of good repute, but hire a painter to do the practical work of applying it.

The interior of the house is still more important than the exterior from sanitary considerations. Paint, flat wall coatings or one of the hygienic kalsomines are not only more wholesome, but also more beautiful than wall paper, and in the long run cost no more.

Beyond the instructions which accompany these products, no advice is necessary, except the precaution that before applying an oil paint to plaster or cement, the surface should be brushed over with a solution of zinc sulphate in water (equal parts of each by weight) and allowed to dry 48 hours before painting. The same rule holds for painting on concrete, cement, or plaster in any situation.

As for wall paper, it is a nesting place for germs, it cannot be washed, and has nothing but cheapness, convenience and variety to commend it. But if wall paper is used—and I soppose it always will be—don't double its unwholesomeness by adding layer to layer. In some states the removal of old paper before repapering is required by law. It should be so in all states.

TREATMENT OF FLOORS.

Rugs, also, as most people know, are more wholesome than carpet. Hardwood floors usually go with rugs, but are not absolutely necessary. An ordinary floor in good condition may be stained and painted into a satisfactory substitute, provided the cracks are filled with one of the several "crack fillers" which can be bought in paint stores.

Belore anything else is done, the floor should be thoroughly scrubbed and dried, rough places sand-papered and nail holes, etc., stopped with putty. After the cracks have been filled, one of the advertised varnish stains may be applied and over this two coats of good floor varnish. Or the floor can be painted after filling with a good floor paint, which is so made that it dries harder and tougher than ordinary paints.

A floor finished in either way is very easily cleaned by wiping with a damp cloth.

Some housewives have a mania for varnishing furniture. I have seen a fine old mahogany clock case so thickly encrusted with successive coats of bad varnish that it looked like black cast iron. The best advice to people with this propensity is that of "Punch" to people about to marry—"Don't!" Rub the old furniture thoroughly with a mixture of boiled linseed oil and turpentine, and let it go at that. If scratched, rub out the scratches with boiled oil and whiting, then apply the boiled oil and turpentine. Varnish that requires complete removal may be removed with varnish remover. This should be done in the open air, as these compounds are very inflammable.

Porch chairs, etc., should be painted each spring with a thin coat of chair paint, red and green being the colors generally preferred. Carriage paint will serve if chair paint is not at hand.

The Nova Scotia Horticultural Show.

Nova Scotia Fruit Growers refrained from showing fruit at the Provincial Exhibition, owning to the fact that the exhibition was held at so early a date that only practically unmature fruit would be available for the display which would be a poor advertisement of the industry that has assumed such large proportions in the far famed Annapolis and Grand Pre Valleys and other sections of Nova Scotia.

The Fruit Growers of Nova Scotia came to the conclusion some years ago that a Provincial Fruit Show held at a time when the apples could be shown at their very best would be the best advertisement of the fruits of their labors that they could possibly have.

They have held several, magnificent well patronized shows at various places in the Valley. This year the Show was located in the Evangeline Skating Rink, Wolfville, which was decorated for the occasion with numerous flags and bannerettes.

The exhibit of apples was easily the finest ever shown in Nova Scotia and was greatly admired by visitors. The past season has been a most favorable one in every way for the production of fine apples, and the display as arranged on the tables was indeed a picture. There was also a good exhibit of pears, and a few plums. In vegetables, too, many good specimens were shown.

There were 2430 plates of magnificent specimens of apples and numerous plates of pears, quinces, pears and grapes, a splendid showing, laid out on four tables sixty feet long and eight feet wide. There was also a very creditable display of roots, grain and products of the dairy.

The whole length of the Curlers' side of the building was taken up with a fine display of apples in boxes and barrels.

The gallery was occupied by an excellent display of fancy work and domestic science exhibits.

Secretary, I. B. Oakes and his Staff worked energetically, to make all the machinery run without friction. The weather was ideal and the attendance was all that could be desired.

A side feature of the fruit show that helped to attract a large crowd of visitors was the horse show at which there were upwards of forty

T. L. Harvey, Mayor of the town and President of the Exhibition Commission, made a brief opening address, in which he spoke of the bountiful crop of agricultural and horticultural products with which the Province had been blessed—the finest exhibit of fruit ever shown in the Maritime Pravinces, and he doubted if it could be excelled in any other portion of the Dominion.

Prof. Cumming, who was the next speaker, thanked the management for giving him this opportunity to be present. This, he said, was the fifth Horticultural Exhibition held under the auspices of the counties of Kings, Annapolis and Hants, in rotation.

He was glad to be able to congratulate the fruit growers of these Counties on showing the evenest and finest all-round collection of fruit yet exhibited in this Province, due partly to the favorable season for fruit growing.

This, he said, was the twelfth exhibition held in Nova Scotia this season, not including the Provincial; and he would say right here that while it is good policy of the Government which enables the holding of these successful local exhibitions, the farmers should be public spirited enough to stand by the Provincial show and make it the success it ought to be.

While it would be a difficult matter to collect in any other section such a magnificent collection of fruit, the unfortunate thing was that it could not be seen by the people of Great Britain and others whom we would like to know that right here in the Annapolis Valley are the finest fruit areas to be found anywhere; for description alone would not have the same effect. He wished we could devise some means to make the fact more widely known.

He had visited this season every Province in the Dominion, and he returned with the honest conviction that in agricultural products Nova Scotia ranked with the best, and in fruit growing we did not have to take a back seat with any of them.

Thirty years ago Nova Scotia raised in the vicinity of 40,000 barrels, but see what an advance had been made—this season the apple crop being estimated from one to one and a half million barrels; and if in the next thirty years the same advance is made, who can estimate what the fruit production would reach, when it was known that not more than 10 per cent. of our fruit growing areas had been broken up. And as the world learns more of the great value of these areas, a further impetus would be given to the fruit growing industry, and our development would keep pace.

He had a word of warning to give to fruit growers. This had been such an exceptionally fine season that the man who sprayed his trees and the man who did not fared pretty much alike, so that the non-sprayer entertained the opinion that spraying was a useless expense. This was a great mistake, and if he put the theory into practice, a damaging one, for should the next season be only an ordinary one and not so favorable, the non-sprayer's fruit shipped in 1912 to England and other countries will do us much harm. He hoped this word of warning would not be unheeded.

Prof. Cumming spoke of the various Co-Operative Fruit Shipping Companies in the Province, and of the great advantage accruing therefrom—the greatest benefit being the care taken to have the fruit packed true of the grade. This co-operative idea, he was glad to know, was taking hold in Nova Scotia. In Denmark, Co-Operative Companies had been productive of great good, and the same would result wherever introduced.

He was glad that the management had afforded him the opportunity to see this magnificent display of fruit and vegetable products, and sincerely hoped the Exhibition would prove in all respects a great success.

LIEUT.-GOVERNOR MacGREGOR.

The Lieutenant-Governor gave a brief address. He said it was his duty to say a few words, and he would be brief. He was thankful to the management for giving him an opportunity to see for himself what he had before heard so much about, as to the fruit growing capabilities of this section of the Province, and he felt impressed to say that the realization far exceeded his expectations, and was delighted to see spread out before him such a magnificent display of fruit, beautiful to the eye, and no doubt gratifying to the most fastidious taste. Ours was certainly a great country and as he came along today and saw spread out before him this beautiful garden of the Province, with such splendid fruit growing areas, and such wonderful possibilities, he could not understand why so many of our young men leave it to try their fortunes in the West, and not always to succeed. He did not wish to decry the West, far from it, for he had made money there, but its possibilities for making a good living were certainaly no better than in Nova Scotia, and fruit growing was only partally developed. He hoped the annually unite to conduct such creditable horticultural exhibitions would continue to make substantial progress, and thus advance the prosperity of the Province. It was to him a source of pleasure to be present, and he now gladly pronounced the Exhibition formally opened.

Mr. Foster, M. P., for Kings, was asked to address the gathering which he did briefly. He first spoke of Prof. Cumming's admirable address, aad said the Local Government had certainly made a wise choice when they selected Prof. Cumming to fill a position in which he displayed such good judgment and so much ability. He spoke of Nova Scotia as a veritable Garden of Eden, replete with rich opportunities and great possibilities, and urged the young men to stay by the Province, and they would be amply rewarded. He complimented the exhibitors upon the splendid products of farm and orchard here displayed, and urged the farmers of Hants, Kings and Annapolis to work well together to make them the banner counties of the Province.

The Implement Shed.

Many farm implements from their very nature are only in use during a quite small proportion of the time they exist. The binder for instance is inactive for eleven months of the year or more. And it is a question whether more deterioration and wearing out of machinery doesn't take place on the average farm through neglect and exposure to weather conditions—which could be avoided—than by wear and tear when in use. In fact a prominent feature on a badly run farm is nearly always neglected machinery.

The main indispensable thing is an implement shed, and its chief property, dryness—protection from moisture above and below. A further valuable protection against the insidious attack of damp is the liberal use of oil on the more delicate parts of the machinery. This can be applied when the implement is put away for some time, and wards off the corrosive rust which costs the owner so much of the value of the machine. If the lack of time or money forces the owner to postpone the erection of an implement shed, a temporary protection may be had in the shape of a tent, or even a waterproof covering fasten over each implement. This, though less efficient than a damp-proof shed, is a great deal better

The Big New Brunswick Fruit Show.

As we go to press the New Brunswick Apple Show is being held for the second time in the City of St. John. The display of New Brunswick grown fruits in St. Andrews Rink is a sight well worth seeing. Last year's show, was a revelation of New Brunswick's possibilities in the fruit growing line; this year's show further reveals these possibilities and also shows what a vast amount of improvement can be made in one short year by the application of practical, scientific knowledge to the direction of work in extending the important industry of fruit growing.

Last year the Dominion Department of Agriculture, showed boxes of fruit from British Columbia, Ontario and Nova Scotia, side by side with New Brunswick grown fruit and the contrast was so much in favor of the latter that it was thought unnecessary to repeat the comparison this year.

The whole display is a magnificent object lesson in what may be done in New Brunswick in the line of fruit growing. When a few such wellgrown, well-colored fruit can be grown as is shown at the exhibition it only needs more capital and more energy—the enthusiasm is already there—to grow thousands of barrels for export trade and should furnish one of the greatest drawing cards to attract the attention of new settlers. Could the whole display be shown intact in London or some other large British city we venture to say that a great many intending emmigrants, who have their eyes set on the golden West, would seriously consider the opportunities offered by New Brunswick fruit lands.

The New Brunswick Department for Agriculture, as is being said by many of the prominent speakers and visitors to the fruit show, are to be congratulated on their aggressive Horticultural policy and their happy choice of so efficient an horticulturist as they have in Mr. Turney.

under the auspices of the Department of Agriculture, undertook to conduct some experiments in the renovation of several old neglected orchards in the counties of York and Albert, for illustration purposes that would be an incentive to owners of similarly neglected orchards to try to give their trees a new lease of life. Pruning, fertilizing, cultivation and spraying were done under Mr. Turney's direction according to the most approved modern methods. That success has crowned his efforts is clearly seen by the tastily arranged display of No. 1 fruit that presents itself to the visitor in the form of a pyramid of boxes and plates of apples accompanied by information placards and photos of orchard scenes near the Rink entrance. Stretching beyond this and on either sides are long tables laden with plates of apples for competition in the singles, the collections and for special prizes, while ranged across the farther end of the rink in a sloping position is displayed upwards of four hundred boxes of McIntosh, Fameuse and other table varieties gathered by the Department of Agriculture from orchards in various parts of the Province. The success attained in this work will, we hope, induce fruit growers in other parts of the Province to send out to the Department of Agriculture the cry "Come over to Macedonia and help us". We know the appeal will not be in vain.

On the northern side of the Rink the St. John River Valley Farm and Fruit Lands Company, a company organized for the purpose of developing fruit lands and inducing new settlers to buy land in New Brunswick and who have a land area of upwards of 900 acres of which Mr. A. Parker, an enthusiastic practical fruit grower of Nova Scotia is manager, are making a creditable exhibit. Further down on the same side of the building Mr. Tappan Adney, Secretary of the Carleton County Fruit Growers' Association has charge of a very pleasing display of Carleton County fruit. The good works done by the late Francis Sharpe of Woodstock in promoting Horticulture lives after him. Although Mr. Sharpe is dead and gone his voice still seems to speak as one after another of his theories and predictions are being verified and are coming true.

The private exhibits are very numerous, coming from ten of the counties of the Province and representing a great many varieties of fruit.

There is also a fine exhibition of Jellies, Jams and preserved fruit, prominent among which is a very nice exhibit put up by the Domestic Science class pupils of the McDonald Consolidated School, Kingston, N. B.

The Canadian Fairbanks Co. and R. B. Westhaver have an exhibit of power and hand spraying machines. These machines have become an absolute necessity to the equipment of any successful, up-to-the-minute fruit man.

Professor W. T. Macoun of Ottawa, Professor W. Saxby Blair of McDonald College, St. Anne De Bellevue, Que. and Professor Percy Shaw of the Nova Scotia Agricultural College are on hand to place the awards and address the Fruit Growers at their annual convention which is being held in one of the rooms adjoining the rink.

A. G. Turney
Horticulturist New Brunswick Department of Agriculture.

A Partial View of the 1911 New Brunswick Apple Show

The exhibit in the foreground is that made of fruit picked from the orchards undergoing renovation during the season of 1911, under Mr. Turney's skilful direction. In the back ground across the end of the building, may be seen the carload of boxed fruit exhibited by the New Brunswick Department of Agriculture.

The public official opening was held on the evening of October 30th when a large number of visitors and prominent fruit growers listened attentively to eloquent addresses, brim full of optimism and encouragement, by C. N. Vroom, President of the N. B. Fruit Growers' Association, Hon. Dr. Landry, Commissioner for Agriculture, Hon. Robert Maxwell, Commissioner for Public Works and Prof. W. S. Blair, who all complimented Mr. Hubbard, Secretary for Agriculture, Mr. Turney, Provincial Horticulturist and the enthusiastic Fruit Growers on their success in developing one of the greatest resources of the Province.

Among the prominent members of the Association present we noticed the veteran fathers of the organization, Messrs. J. C. Gilman of Fredericton and S. L. Peters of Queenstown, Clark of Sunbury Co., Flewelling of Kings Co. and others, radiant with the realization that has come after long years of hard work and anticipation. They are there to encourage the younger men to move onwards and upwards to a higher plane of perfection in their vocation.

A list of awards and the deliberations at the annual convention will be given in our next issue.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents; 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address all letters and make all checks, money orders, postal notes, etc., payable to

THE ISOLATED BREEDER.

The young breeder of dairy cattle like the young professional man or the young merchant must establish for himself a reputation before he can enjoy his success to the fullest measure. Only in exceptional cases is it possible for one to spring at once into the public eye and attract the attention of all comers by some spectacular feature or individual. The man whose success is more lasting is the man who enjoys a steady, continual growth in his work. There will of course be accidents and back sets that cannot fail to be discouraging but at the same time the success that will finally be enjoyed will depend upon keeping everlastingly at it with a fixed aim in view. The young breeder in many instances will be a pioneer; that is, he will be isolated from others similarly interested and as a natural result it will be necessary for him to fight his battles unaided and alone. The breeder who is located in the communities where there are others following the same line of work will have an opportunity to get advice and encouragement and he will also find that his market is stimulated by the buyers that are brought to the community by the older established breeders. The isolated breeder must depend in many instances upon mail-orders for it is difficult to get the prospective buyer to go out of the beaten route of travel to hunt for stock. Some of the finest trade that is brought into any community comes through co-operative buying and selling ; that is, the best deals are often made where more than one breeder is interested. A man will go to a community where he can pick up from one to a carload of cattle more quickly than he will hunt out an isolated breeder who has at best only a few individuals for sale. In this community of breeders there will be a better field for one to select from and the cost of the animals will be reduced because the travelling and freight expenses will be at a minimum. Also the loading and other incidentials that are known only to those who have had actual experience in this work will be less expensive. It naturally follows then that if one is not fortunately situated he should undertake to stimulate an interest in his particular breed of cattle by judicious use of his bull in the neighbor's herds. An interest can be awakened among the other good dairymen who are in the same vicinity better through an illustration of what the real dairy breeds will do by the monthly milk check. As soon as a man finds that his neighbor is drawing larger pay for the work that he does in feeding, caring for and milking his cows, he will begin to investigate for the purpose of finding the reason why. If a man can be shown that the answer is better dairy cattle it will not take him long to build up a grade herd and this is almost invariably the stepping stone that leads directly to the pure bred herd. When two or three men undertake work of this kind it doesn't take long to establish a real community.

The isolated breeder who is successful has the entire market to himself but it is a questionable advantage for it is a time honored saying that competition is the life of trade and as soon as any individual or organization secure a monopoly, the chances are that their market may be neglected and sales are naturally more dificult. The young breeder is always the target for criticism and the laughter of his neighbors and he deserves credit and encouragement. Everything that can be done should be brought about to stimulate his interest and keep him awake to the possibilities of his business. He should keep constantly before him the success that has been made by others who have struggled along against the same disadvantages, although discouragements may come, let him try to realize that they can be made the stepping stones to success. If these young men who are now in the breeding business will use good common judgement and stick to their proposition, keeping ever before the possibilities which the obstacles that seem to obscure the way there is little question but what success will eventually crown their efforts.

BUSINESS IS BUSINESS.

A successful city merchant, somewhat run down with the strain of business, once paid a few days visit to the home of his brother, a farmer doing moderately well, whom he had not seen for many years. The visitor took the keenest interest in everything on the farm, and though he made few comments asked innumerable questions. In fact, the interest he took in everything seemed to do no less towards recuperating his health than the rest and the change of air and scene.

"You seem to take a great deal more interest in this place than I do," said his farmer brother one day, "If it was a business, like that you've got in the city, you couldn't be keener on it."

Why, that't just the reason," he replied. It seems to me that farming is just as much a business as anything that goes on in the city, and though of course I couldn't run a farm now without making heaps of blunders, maybe I could make a few suggestions as to the business side of it. You work hard enough, but you don't seem to me to get as much money out of this farm as you ought.

"Let's hear what you have to say then," said the farmer. You're not a farmer, it is true, but I'm not fool enough not to pay any attention on that account. Fire ahead,"

"Well, I didn't know barley from wheat until I came here, but I guess I can help you a bit for all that. Where you fall short, it appears to me, is in attending to the markets. A man who wants to do any selling must find out what the buyer wants, when he wants it, and how he wants it. If I didn't attend to that rule in the city, I'd soon go to the wall. Now take those lambs you were telling me about yesterday. You got a wretched price for them, for the market was dull. But sometimes the dealers will give fancy prices,—they have to—for prime quality lambs for Christmas and Easter markets for example. People will pay liberal prices for it then. It wants forethought and careful management months in advance, but isn't it worth it ?

"Then again take the batch of poultry you sent in to market the other day. I asked you and you said you hadn't fattened them, Then too they were all sizes, whereas it is the good-sized fat fowls that poultrymen pay good money for, unless of course they are broilers. A fortnight in the fattening coop would not have been much trouble, but it would have brought in some extra dollars.

"Speaking on that subject, why don't you caponise your cockerels ? There is a big demand for capons, for the flesh is of prime quality, and there is three times as much of it on the breast, where it is wanted, of a fat capon, as there is ordinarily. Caponising tools are not expensive, and I understand the work is simple, and done in a minute.

"All this means a lot of extra work ? Yes, that is true, especially brain work. You cannot do everything, but the important thing is to plan to do that work which will bring in the most returns. Get other men to do the manual labor the minute you can afford to hire them. If you set your thinking-box to it, ideas will soon spring up, and then all you have to do is to carry them out. But the main thing is to discover what the public wants, and then give it to them."

Can you say : "I am satisfied that the dairy is a paying proposition for me and has been made so by sticking to one established breed, keeping a bull that was better than my cows, using the milk scales and Babcock test, weeding out my poorest cows and studying the feed proposition."

* * *

How much is it worth to you, brother farmer, to be your own boss. Did you ever set it down among your assets ? Think about it, whenever you become a little discouraged over your prospects.

Cooked Food For Stock.

There are perhaps, few questions of stock management in regard to whic stock management in regard to which there is a greater difference of opinion than on that of whether it is worth while to cook food for stock. There are those who maintain with great positiveness that it is. There are others who, writing from the scientific side mainly, object that cooking adds nothing to the digestibility or the nourishing character of the food, and that the cost and labor of cooking are thrown away, or at best meet with but a small return in the opportunity afforded of smuuling into the stomach of the animal food that it would otherwise reject, and which cannot, therefore, be of much leeding value. The feeder who has a good supply of steam on the farm will frequently have found it most convenient, and will have satisfied himself on many occasions that he has been able to provide palatable rations for his stock, which would otherwise have been unsatisfied had not the convenience for cooking been at hand. How far this has been a gain must, of course, depend on circumstances. It might have paid him better to be better supplied with cakes and roots and other foods; but a man must cut his coat according to his cloth, and there is generally on every farm, at some time or other, a scarcity of good foods, and a variety of fodder that cannot be classified as first-rate, but which has to be made the best of, and if cooking will make it possible at small cost to use it, it would seem to be a mistake to refrain from cooking.

At any rate, it will hardly be disputed that food may profitably be cooked for pigs. The pig is an animal that suffers from cold more than any other. A litter of pigs in the winter season is a trial that the wise pig-keeper is anxious to avoid, more especially after he gas once undergone the visitation. Unlike most other animals, the pig does not lie on its bed, but as far as possible gets into it, and pigs kept together will be noticed in cold weather huddled up as closely as possible for warmth's sake. We contend that, particularly in severe weather, it is not a matter of no importance whether the sloppy food given the animal be comfortably warm or icy cold. If the food is cold it has to be raised to the temperature of the body, and some of the food has to be used for this purpose; this is a loss that would be avoided il the food were warmed. Moreover, the pig is chilled, its comfort is impaired, and the fattening process is retarded so that there is a double loss. It may be questioned whether the same rule will hold good with cattle generally, but the dairy cows might very well have some of the mashes warm. In the end it resolves itself into a question of expense. If steam is already available this is practically nil, and where it is not there are now on the market many cheap cookinh apparatuses which will enable a supply of hot water to be obtained at all times at a small cost. Some of these are exhibited from time to time at our agricultural and other shows, and farmers would do well to inspect them.

Necessity of Phosphate of Lime.

The absolute necessity of a supply of phosphate of lime in arable soils was clearly demonstrated by the experiments of Boussingault. He planted a series of different kinds of plants in calcined sand containing no nitrogen, phosphate, potash, or any other element of plant life; then he applied to the plants all the recognised elements of fertility excepting phosphate of lime. The plants languished, and failed to develop. He then repeated the experiments, adding phosphate of lime, and the result was a rapid and perfect growth.

CONCRETE WORK IN FREEZING WEATHER.

UNTIL a few years ago, although concrete had already been generally adopted throughout the country by contractors and farmers for almost all structural work, it was the practice to stop all work on this form of construction as soon as the cold weather set in.

It has been found, however, that concrete work may be carried on in cold weather successfully, and with but very little more trouble than under ordinary circumstances.

This fact is of great benefit to the farmer, as it is in the colder period of the year that he is able to find time for building and making the many articles around the farm to which concrete so readily adapts itself.

With a few simple precautions it has been found that concrete can be used, not only in freezing weather, but when the thermometer has been actually below zero.

If the concrete freezes before it starts to "set," it will not be injured, but if the freezing takes place after the "setting" action has started up, the concrete is likely to be damaged when it thaws, owing to the expansion of the melting water forcing the particles apart and making the concrete crumbly. On the other hand, if the concrete has a chance to become thoroughly "set" before freezing, no harm will be done. To give it this chance you must first of all prepare the materials as described below, and secondly, you must protect the concrete after it has been placed in the "forms."

PREPARATION OF MATERIALS.

Concrete will, on its own account, develop a certain amount of heat in

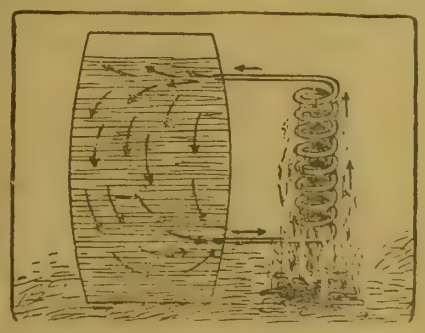

FIG. 1. SHOWING SIMPLE METHOD OF WATER HEATING.

the "setting" process. But in cold weather, some outside assistance, in the form of artificial heat, is necessary. The best way to develop this artificial heat is to warm the materials before mixing. This shortens the time that it takes the concrete to "set" and lengthens the time necessary to bring it to the freezing point. Bear in mind that the less water used, the quicker concrete "sets." Therefore, it is advisable to use as little water as possible in the mixing during cold weather.

HEATING WATER.

A simple and easily-made vessel for heating water is shown in the accompanying drawing. (See Fig. 1.). A coil is made of one-inch pipe with the ends fastened in the barrel and made water-tight. A small fire built under the coil will heat the water rapidly and will keep it in circulation, thus keeping all the water heated.

For this purpose it is wise to use a length of malleable iron gas-pipe, because it is easily bent into the required coil. This is done by taking a log or fence-post about the size of the coil and bending the pipe around it. This method prevents the pipe from "buckling" and makes the coils more regular in size.

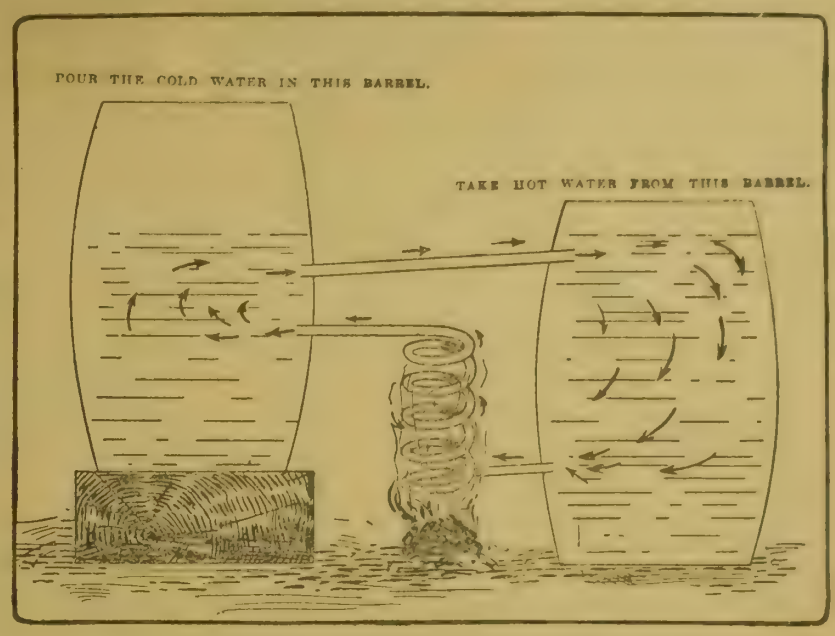

FIG. 2. SHOWING TWO-BARREL METHOD OF HEATING WATER.

Where concrete work is being done on a large scale, it is advisable to use the two-barrel heater shown in Fig. 2. This allows the water to be constantly replenished without reducing the heat of the water in the barrel from which the hot water is taken.

Most farmers, however, possess large boiling kettles, used during butchering time, or for making soft soap, etc. One of these will do equally well.

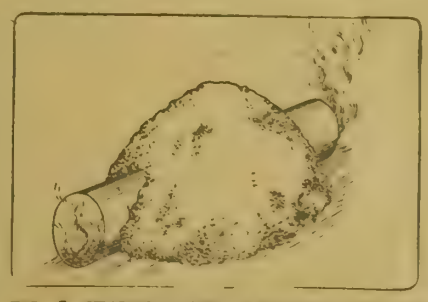

FIG. 3. SHOWING HOW MATERIALS MAY BE HEATED BY MEANS OF A FIRE IN AN OLD STOVE-PIPE.

HEATING SAND AND STONE.

Sand and stone may be very easily heated by making use of two pieces of stove pipe, one piece for the sand and the other for the stone. The pipes are laid on the ground in such a position as to allow the wind to make a good draft. The fire is then built in one end. The flames pass through, heating the whole pipe, and as fresh fuel is added, the cinders are pushed along the pipe and gradually work out at the other end. The sand and stone should be piled on top of the stove pipes, and will soon thaw out and become heated.

In very cold weather, the cement may be heated by laying the bags on top of the sand, but this is not absolutely necessary, as the cement itself must be kept dry until used, whether the weather be hot or cold.

TEMPERATURE REQUIRED.

Materials should not be heated to too high a temperature. A good way to judge the proper amount of heat is to make them just hot enough to be comfortable to touch. Care should be taken not to use any frozen lumps of sand.

PROTECTING CONCRETE IN POSITION.

After the concrete has been placed in "forms" it should be protected so as to keep the heat in as long as possible. This is more essential in thin structures than in massive walls and foundations; for the latter will hold their own heat longer on account of their thickness.

Wooden "forms" are non-conductors, and will retain the heat in the concrete up to a certain point, but the concrete should be protected on top by a covering of canvas or heavy paper, with a layer of ten or twelve inches of manure on top of this. Straw will also answer the purpose. If manure is used, care should be taken to prevent it from coming in contact with the concrete, as it will discolor it, and possibly even seep through sufficiently to weaken the structure.

PROTECTING THIN STRUCTURES.

In the case of thin walls where extra cold weather calls for additional protection, heavy paper should be nailed to the vertical posts of the forms, (see Figure 4,) thus leaving an enclosed air space between each pair of posts. These air spaces will have about fifteen degrees higher temperature than the outside air. The "forms" should always be left on longer in cold weather, as it takes longer for the concrete to harden.

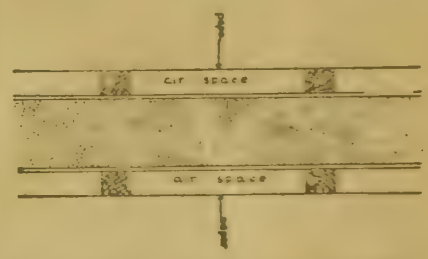

FIG. 4. PAPER TACKED TO WOODEN SUPPORTS TO PROTECT CONCRETE FROM FROST.

There is no reason why concrete cannot be used with complete success in cold weather if these simple precautions be followed.

HORTICULTURE.

Quality Counts in Fruit.

I should place at the head of the list the quality of our eastern grown, and partirularly our northeastern grown fruit. I believe there is no other section where flavor, aroma, juiciness, sweetness, in fact, all those factors on which we base quality, more particularly in the apple, but to a greater or less extent all fruits, are more highly developed than they are right here in the Maritime Countries. This is not my own judgment alone, though I have had many opportunities of comparing the fruit of this region with that of other sections, and particularly with the far western apples so generally found in full possession of our best fruit stores. Almost without exception, when our eastern apples are as well grown and have been as carefully handled, I have had no hesitation in saying that the advantage of quality lies with our home apples.

If this is so, the importance of this one fact more than outweighs all other possible advantages that the west may have over us. "Quality" ought to be our motto, to be kept constantly before our growers from the time they select their varieties until the ripe fruit is placed in the hands of the consumer in absolutely perfect condition as to growth and handling. It ought to be dinned into the ears of the customer, and in every way possible brought to the attention of the other senses, particularly his sense of taste, until to call for eastern apples would not be the last, but the first thing he would think of doing. Of course, the western grower scouts at the idea that the east can grow fruit of better quality or even of as good quality as ge can grow. And this matter is yet to be tested, but whatever the quality when the fruit leaves the trees, I believe there is no question that when the western fruit gets into the hands of the eastern consumer it is not in most cases of as good quality as that of equally well-grown eastern fruit.—Prof. F. C. Sears, Mass, Agri. Col.

Disposing of Low-Grade Apples.

Hand thinning immediately following the "June drop," or earlier with varieties like Wealthy, to one in a cluster and 6 inches apart, is the ideal way of solving the problem of disposing of low-grade apples. When systematically followed it tends to produce the annual bearing habit. By following and practicing the recognized up-to-date orchard methods thorough spraying, liberal fertilizing, early plowing and frequent cultivation—the orchardist is reasonably sure, barring frosts and windstorms, of crops of good quality. These, with hand thinning, will pack a large percentage of No. 1's and a few No. 2's of good quality.

By making at least two pickings of all varieties and three of some, the drops or windfalls are lessened in quantity, the harvesting season prolonged, and total crop production increased. By using at least three sizes of fruits in grading for packing in barrels, the trade demands are better supplied, especially when a certain uniform sized apple is needed for a certain market, or to be sold at a popular price. By following the suggestions outlined, a large percentage of crop remaining will be windfalls, and these may be disposed of to shippers of "bulk" cars, to canning factories, or to evaporators, according to local market conditions, grades and prices. In many cases evaporators have been erected as a means of crop protection against hail and windstorms, unexpected fungous attacks and second brood of codling moth.

In large apple producing centers a combination of canning factory and cider mill has been very satisfactory, contracting for all drops and culls after packing certain grades of barreled fruit, sizing this mixture by using mechanical graders, thus relieving the orchardist of considerable work during the rush of picking and packing. The future of the evaporated fruit industry is uncertain. Doubtless we cannot expect present high prices to continue, but by meeting trade demands for a higher grade product, consumption may be increased and fairly remunerative prices secured. There may be an overproduction of canned goods, with lower prices as a result. One must be ever on the alert as to market changes and crop conditions.

By establishing a co-operative packing house, plants for the disposal of low grades naturally follow. With the enormous acreage of apples being planted and soon to produce crops, a year of overproduction with attending high prices may possibly awaken the orchardists to conditions and the necessity of thorough organization.—N. E. Homestead.

Why Not Raise Celery.

One of the many side lines certain to bring in a handsome profit to any farmer with iniative and push, and with an eye on the demands of the market, is the growing of celery. Some may object that if a farmer does raise any he cannot sell it. Here however we beg to differ. There is always a demand for good succulent vegetables, and though celery;unlike potatoes can be done without, people will buy it at a good price if they are sure of the quality. Two things the celery grower must have to command success, he must supply healthy and tender celery, and he must get in touch with and the confidence of the consumers.

As to the first point, to avoid getting woody and stringy stalks, (which must be avoided at all costs) plant out the celery fairly late, the end of June is a good time. By doing this the plants will grow more quickly and therefore will be more tender than those planted early. A good plan is to plant in trenches. These can be made with a plow, turning a furrow each way. Plow twice so that a trench 15 or 16 inches deep with sheer sides and two feet apatt is formwed. Two rows can be placed in the trench each eight inches from the side. Thus there will be about eight inches between the rows.

The banking of celery takes place from the outside, that is, the earth is dropped in between the trench and the rows, but the banking between the rows must keep pace with it. This operation must keep up well with the growth of the plants, which must not grow very much above the level of the earth. A good rule is to do the banking once a week.

On the arrival of the cold weather the plants must be covered. A convenient method for a farmer is to use green feed sheaves. Place one on each side of the trench and one on top. Thus both protection and bleaching is arranged for the celery plants, while the sheaves are of course still available as feed.

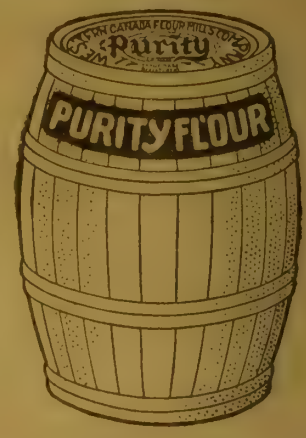
When the bleaching has been thoroughly accomplished the plants should be placed in shallow trenches in the cellar. Enough earth is placed around the roots to keep life in the plants and prevent rot from occurring. In this way the celery can be well kept for many months.

It will be seen from these remarks that the growing of celery requires no great skil, or experience, but only care and attention such as anyone ready to give his mind to the business can devote to it.

Try the flour that holds the confidence of thousands of home-cooks

THE present huge demand for PURITY FLOUR shows the confidence in which it is held by thousands of home-cooks.

Those who have used PURITY FLOUR have come to believe in it. They look on PURITY as a friend. They feel they can trust it implicitly, because each and every lot of PURITY FLOUR has always been uniform—always up to the high standard of quality that has made it famous.



Wouldn't you, too, like to use a flour you could always rely on? Wouldn't you like to feel certain that your bread, cakes, and pies were going to turn out exactly right? That's just how you'll feel when you become a user of PURITY FLOUR — the confidence-creating flour.

PURITY FLOUR gives high-class results, because it *consists exclusively* of the *high-grade portions* of the best Western hard wheat.

On account of the *extra* strength of PURITY FLOUR please remember, when making pastry, to add *more* shortening than an ordinary flour requires.

PURITY FLOUR

"More bread and better bread"

And when making bread add *more* water, and PURITY FLOUR will expand into more loaves than the same weight of ordinary flour can produce, thus making "*more bread and better bread.*"

Make your next flour order spell P-U-R-I-T-Y F-L-O-U-R.
It costs slightly more, but it's worth the difference.
Add PURITY FLOUR to grocery list right now.

Important for the Fruit Industry.

Now that autumn has come again and the summer is gone, the various species of song birds which have spent the season with us are gathering together into flocks in preparation for their long flight to the South. It is not an uncommon sight to see a hundred or more of them together on a single ?ree, some of these cool mornings, causing it to look fairly alive with them.

At this time of the year, too, there always comes a great temptation to boys and lovers of the gun to get down the shotgun from the attic or chimney corner where it has stood during the summer, and 'go after birds," and, failing of larger game, it usually happens that the song birds have to sufer.

It would be impossible to estimate the value of insectivorous birds to the farmer. They are of the utmost service to him. Why is it that we hear so much more, nowadays, about the inroads of insect pests than formerly? Largely because we have permitted the ruthless destruction of

birds to go on in such an unrestrained manner, year after year. The shotgun is the best friend that the injurious insect has in all the world. Going out after birds with the gun, and its usual sequel, is the equivalent of lending aid and succor to that most dangerous enemy, the all-destructive worm.

It is the duty of every reader of this publication to do all in his power to protect birds from the shot gun, this autumn. He is sacrificing his own interests, encouraging his enemies, doing an injustice to his neighbor and to his country if he does not endeavor to stay the hand of the thoughtless destroyer of bird life whenever the opportunity offers.

Let the gun stand in the chimney corner this fall. It will do more good there than anywhere else.—Maine Farmer.

Aid Wounded Trees.

Early fall is the time to watch your valuable old shade and fruit trees. Watch for the hollow trunk, the broken limb or the exposed wound where fungi may enter and ruin the stately old friend.

From any wound remove all the decayed wood, with a chisel and adz, to the sound, hard wood, and smooth off the edges of the cavity to allow the free growth of the inner bark.

After the cavity has been thoroughly cleaned out, disinfect it with corrosive sublimate, creosote or even paint. Creosote is better, as it penetrates farther into the wood. The cavity should now be filled with concrete, one part Portland cement to two parts sand. Make it thin so that it can be poured in at the top of the opening. When the cavity is large it is necessary to re-enforce the concrete by placing iron bars across the inside. It is also best to drive large nails part way in around the inside, and this enables the concrete to adhere better to the trunk.

As the filling shrinks considerably in large cavities, the walls should be first coated with a thick layer of tar. This expands and fills the shrinkage crack, making the cavity air tight. There is now no chance for any disease to enter and get in its work.

After the filling has set a little, the surface should be smoothed off even with the inner bark. In a few years the cambrium will completely cover the filling, making a good looking tree.

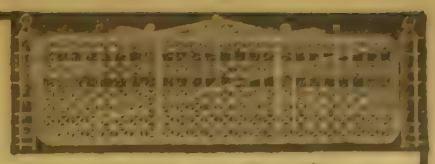
Heading Back Young Trees.

Finding several growers with the opinion that young trees should not be headed back the first year, or not at all, which in the majority of cases, is a great mistake, I am giving you the results of an experiment which we carried out in Ontario County last season. Probably about two hundred trees were cut back at time of planting. Later in the season the unpruned portion suffered so greatly that we were compelled to prune some of them in order to save the trees, as so many died back further than they should have been cut.

This season, the foliage of the trees which were cut back at the time of planting, is in the very best condition. The trees stand erect and have made a wonderful root and body growth. The dying trees cut back late in the season are looking equal to those not cut back, which all show a sickly condition.

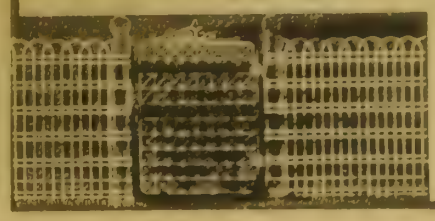
The remainder which were cut back this spring show the effect of having too heavy a top for the roots. They have been whipped back and forth by the wind, have made no body growth and appear to be a year behind the portion headed back. During the winter the trees suffered very little from freezing back, all portions being equal in this respect. The loss in trees seemed to be sustained by the unpruned portion, which goes to prove trees are better cut back at time of planting.—R. R. Waddle in Canadian Horticulturist.

Strength and Service



That's what you get in Peerless Gates—the strength and service that keep them swinging evenly on their hinges year after year. They won't warp or sag because the frames are made of heavy, steel tubing, electrically welded into one solid piece.

Peerless Farm and Ornamental Gates



We manufacture lawn, poultry and farm fences and gates. We build them as they should be built, and give the most satisfactory service. Our standard of quality is high, and we stand behind it. You can always depend on Peerless goods. Write for full particulars.

How We Have Fresh Rhubarb in Winter.

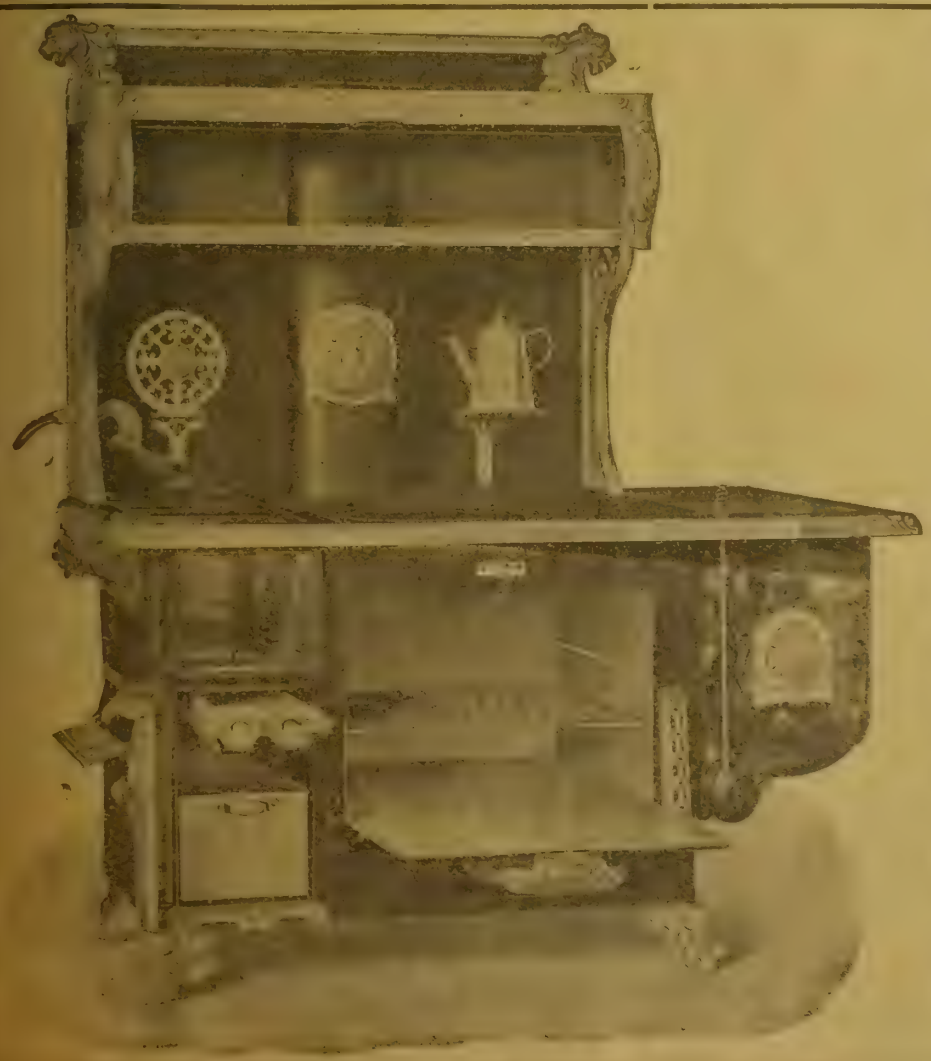
Rhubarb of most delightful flavor may be grown and had fresh during the wintertime on any farm where the roots are available. We have received much satisfaction from the rhubarb we have been growing in the wintertime now for some years. Our practice is to get the men to dig up three or four roots of rhubarb late in the fall and have the roots set on a board in the garden so that they will not freeze down and be impossible to get them loose. After they have been frozen solid, the roots are carried into the cellar of the house and placed in a dark corner, where they are banked smoothly with a few buckets of earth.

As soon as the frost thaws out of the rhubarb the plants begin to grow, and in a very short time they will have great long stalks without much leaf and be ready to cut for rhubarb sauce.

It makes a nice variety for the table to have some fresh rhubarb now and then throughout the winter. Since it is such a simple matter to grow it in the cellar there is no reason why almost any farmer should not have it.—Farm and Dairy.

When large strawberries are desired rather than quantity most of the runners must be cut off. Two to five runners may be left to each plant. These should be carefully trained by hand so that the young plants may have plenty of room to grow and produce large fruit.

This system requires a large amount of time and labor and is used mostly in small gardens where a few berries of extra quality are desired for table use.



The Universal Favorite

Is a High-class Family Steel Range, honorably built of the best material, and put together as tight as a steam boiler, and is guaranteed to cook and bake perfectly.

NOTE:—The spacious fire box for wood.
The large fire box opening, 7½x8½ inches.
The roomy square oven.
The top-hinged key plate.
Also note how easily the coal grates can be removed.
The linings can be changed from coal to wood, or vice versa, without the disturbing of a bolt.

There are thousands of Universal Favorites in the homes of our farmers, making cooking and baking a pleasure and the kitchen work easy and light.

THE UNIVERSAL FAVORITE is specially built to meet the requirements of farm homes. The top is large and roomy with six pot holes, the oven will bake sixteen loaves of bread in pans 4 1-2x10 inches at one time. The fire box for wood is 29 inches long, and will burn coarse wood of any kind

NO RISK IS TAKEN, as an unconditional guarantee goes with every UNIVERSAL FAVORITE that it will cook and bake perfectly.

The Universal Favorite is procurable from a dealer in your market town. Manufactured by,—

FINDLAY BROS., CO. Ltd., Carleton Place, Ontario.

DAIRYING.

Why Not More Improvement in Farm Butter?

'Tis true, and pity 'tis, 'tis true, and no one regrets to acknowledge it more than myself that the great bulk of dairy butter does not rank as first class. I have wondered why this is, and have come to the conclusion that the majority of buttermakers have not a right standard of butter and do not know the requirements for a high-class trade. The most fastidious and critical consumers of butter are the rich. This is because they pay prices that insure the greatest skill and care being taken in the manufacture of the butter. After being accustomed to the sweet, delicately-flavored, lightly salted and lightly colored butter, the change to an inferior make is quickly noticed.

COMPARISONS ARE EDUCATIVE.

Why does not the farm butter maker improve as she should? I believe it is because the only butter she has an intimate acquaintance with is her own and she has grown so used to the faults therein that to her they cease to exist, and she thinks her butter equal to any made. Improvement almost solely comes by comparison. We are the poorest judges of our own make and should seek the honest opinion of reliable judges and profit by their criticisms. There is a whole lot in getting used to a thing; the poor little city boy, when in the country on a "fresh air vacation," didn't like the eggs because they lacked taste and smell.

I remember a like experience. I had taken a first prize for butter, and so proud was I that when I went to visit a farmer friend I took along a piece of my prize butter. It was tasted by the family and the good man of the house frankly admitted he liked his own better and thought it was equally as good and insisted on his wife going to the cellar for a sample. She demurred a little, but obeyed. I feel my surprise yet, for when I tasted it, it was as turnipy as could be. And what was I to say—a guest of the house? I was frank and told them they had become used to the turnip flavor, but it wouldn't do in the show ring.

SOME POINTS ABOUT FLAVOR.

Wherein is our farm butter at fault? I trust that my readets will understand that I am writing in a most friendly, helpful spirit and hope fault? I trust that my readers will tend toward improvement. In the first place, the cause of the objectionable flavors is too frequently due to badly ventilated, dirty cow stables, and uncleanly milking. Milk seems capable of absorbing every odor that comes its way. Then the separator is ever a bone to pick at, but I believe in respect to its proper care there is a marked improvement. There are still those, however, who would hesitate and find an excuse if you asked to see their separator. A separator must be thoroughly washed every time it is used—not just a dipper or two of warm water run through it; we don't call that washing—but the bowl taken apart and well washed and scalded.

And now comes the greatest reason why so much of the farm butter, and the cream sent to the creameries, is off flavor: The cream is not quickly cooled after it is separated. I don't know why it is, but I do know that the warm cream from the separator, if given no particular care but merely set aside to cool, develops a peculiar flavor that I can detect in the cream and butter every time. Cream should be quickly cooled to 55 degrees or below by placing the can in cold water. If water be scarce pour the cream in shallow pans so it will the more rapidly give off its heat, and set the pans in a cool place.

MUCH CREAM IS TOO RIPE.

Lots and lots of butter ranks as second because the cream was overripe. Much of the cream is kept too warm during the ripening process and in winter especially is held too long before churning. The delayed churning gives to butter that "cheesy" flavor. Cream when ready for use should be of the consistency of molasses, smooth and velvety when poured and of a pleasant, mild, acid taste. Always err in having it under rather than over-ripe. We should look at the ripening process in cream much the same as that of fruit. We eat a pear slightly under-ripe, and while it has not the good flavor of one in exactly prime condition, still if it were over-ripe we would not relish it at all. I strongly urge more intelligent care of the cream from the time it leaves the separator till it gets into the churn.

THOSE WHITE SPECKS.

We have all noticed tiny white specks in farm butter—a bad fault, for if such butter has not already an old flavor it wil, soon develop one. These specks can easily be avoided by keeping the cream stirred right from the bottom to the top. The skim milk settles to the bottom, and if it is not well stirred in with the cream, becomes firm and adheres to the butter-fat during churning.

Sometimes care is not taken when warming the cream for churning. If overheated the casein or curdy matter hardens and white specks in the butter follow. Pouring hot water into the cream to hasten the churning has the same bad effect.

Manybutter makers still guess at the churning temperature, and too often the result is a soft, greasy mass in the churn instead of firm, wheat-like granules. Soft butter holds the buttermilk, cannot be well washed, and is in a bad condition to be salted and worked; and behold the product! a butter weak and spongy in texture, buttermilk in the brine and the color streaked and mottled.

A SERMON BOILED DOWN.

Just these few words in closing. 'Tis a tale oft told by me: Adjust the separator to give cream testing 25 per cent. butter-fat, or, in other words, cream that will make from two and one-half to three pounds of butter a gallon; have cream on the sweet side, rather than one day too old; never fill the churn over half full (better only a third full); churn at that temperature (found by the use of a thermometer and a clock), which brings butter in from 20 to 25 minutes; have the butter in the granular form when through churning; wash it in the churn, using quite as much water as there was cream; use from three-quarters to one ounce of salt a pound of butter; give it a thorough working; print and wrap neatly in parchment paper; keep in a cool, clean place, and get it to the consumer as soon as possible; observe cleanliness in every detail of the work. This summary is the boiled-down essence of a sermon on "How Farm Butter May Be Improved."—Laura Rose, Guelph, Ont., in Farm and Dairy.

How I Make First Class Dairy Butter

Every farmer's wife and daughter should have it as an aim and ambition to be able to make high-class butter. We do not speak disparagingly of the article our ancestors produced with their very crude methods, and who have handed down to us so many useful hints. Science, observation and experience, however, have taught us that more modern methods have met with greater success. To insure the best results in butter making the best appliances and greatest care on the part of the maker must be exercised in the preliminary stages and also throughout the entire process of butter making.

The first essential in the manufacture of any article is good raw material, and perhaps in no realm is this more necessary than in the production of high-class butter.

More and more attention is being paid to the selection of good dairy cows. They must be comfortably housed and well and regularly fed. If we want milk we must give plenty of good wholesome food and an abundance of pure water; the latter is just as essential as the former.

MUCH MILK IS SPOILED BY DIRT.

Much milk is spoiled by dirt and bacteria before it leaves the stable. It is wise to keep the cows and their surroundings as clean as possible. The milking should be done quickly and thoroughly by a cleanly person and the milk strained through a very fine sieve or through two or three thicknesses of cotton.

We consider the cream separator the ideal method of getting the cream from the milk. A separator if properly handled should mean more butter, better butter, more money, better young stock and less labor, especially for the woman. The skimming and washing of endless pans and cans, and the warming of the milk for the calves is done away with—the cream alone to be cared for. The separator should be washed each time it is used.

In caring for the separator cream the main point we bear in mind is that fresh cream should not under any circumstances be added to the cold cream previously gathered until it has been cooled to about 55 degrees, as the fresh cream added from time to time soon causes the cream to become too sour. To make good but-

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

The Terrible Pains of INDIGESTION

Mr. Wm. H. MacEwen, Mount Tryon, P.E.I., says:—"For more than a year I suffered with all the terrible pains of indigestion, and my life was one of the greatest misery. It did not seem to make any difference whether I ate or not, the pains were always there, accompanied by a severe bloating and a belching of wind. I did not even get relief at night, and sometimes hardly got a bit of sleep. In my misery I tried many remedies said to cure indigestion, but they did me not one particle of good, and I fully expected that I would always be afflicted in this way. At this time my brother came home on a visit, and urged me to try **MILBURN'S LAXA-LIVER PILLS**, and got me a few vials. By the time I had taken one vial I began to improve and could eat with some relish. I was greatly cheered, and continued taking the pills until all traces of the trouble had disappeared, and I could once more eat all kinds of food without the slightest inconvenience. I am so firmly convinced of their virtue as a family medicine I have no hesitation in recommending them."

Milburn's Laxa-Liver Pills are 25c. per vial, or five for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

SAVE THE DIFFERENCE

Ask yourself why "peddlers'" and other inferior cream separators are being discarded for

SHARPLES
Tubular Cream Separators

The purchase price of inferior separators is only the beginning of continual expense. Owners of such separators have lost cream and paid for repairs until they were sick of the sight of their inferior machines. We are telling you just what these people frankly tell us every day in explaining why they discard their cheap machines for Tubulars.

They tried to save a little difference in purchase price. But they found they lost a big difference every year in profits. They finally got the Tubular and now save this difference in profits every year.

Consider these facts. Act wisely. Don't do what others regret they did. You will finally have a Tubular—so get it now.

Remember that Dairy Tubulars have twice the skimming force of others, skim faster and twice as clean, contain no disks, wear a lifetime, are guaranteed forever by the oldest separator concern on this continent. Our local representative will show you The World's Best for the asking. If you do not know him, ask us his address.

Gates' Certain Check.

ter from cream gathered in this way we keep it sweet and free from bad odors until enough has been gathered for a churning, stir well each time new cream is added, then ripen all the cream at once.

Very fair results can be secured by using naturally ripened cream, but we much prefer using a starter or culture. A very good, practical culture for farm dairy use is naturally thickened skim milk, which has a mild, clean, acid flavor. It is at its best just after thickening. If the ripening process is started in the morning the cream should have an acid flavor and be slightly thickened by night. At this stage I give it a thorough stirring and place it where the temperature will fall to that at which we wish to churn. We try and regulate the temperature and quality of the cream to have butter come in about 30 minutes.

Before using the churn it should be first rinsed with hot water, then thoroughly scalded with boiling water (occasionally it is well to give a scouring with salt), then cooled with cold water. When pouring the cream into the churn we strain the cream through a perforated dipper to remove any pieces of hard, curdy milk it may contain. In winter, if necessary, we add just enough coloring to give the butter a nice, pure tint.

No definite temperature for churning can be given, but I prefer about 60 degrees in winter and 50 degrees in summer' When the butter has just come we add a few quarts of water, a few degrees colder than the cream. This gives the butter sufficient liquid to float in and allows the buttermilk to run off more freely. When the granules are the size of wheat grains we drain off the buttermilk through a perforated dipper.

We wash the butter, by straining into the churn as much water at a temperature of about 50 degrees as there was cream at first. We turn 12 or 15 times, then drain off all the water. If the butter is for immediate consumption one washing would suffice, but if for packing, two washings are better.

We now take the butter from the churn, weigh and remove to a V-shaped lever butter worker. We sift on good dairy salt to the amount of three-fourths of an ounce a pound of butter for prints and seven-eights of an ounce a pound for a package. We then work by means of downward pressure, avoiding the sliding motion as it injures the grain of the butter. We work just sufficiently to expel moisture. I use the oblong pound print and wrap each print neatly with good parchment paper (that has been previously drawn through cold water) having printed on it our own stamp. We keep prints in a cool place, see that they hold weight, and get them to market as soon as possible.

The most suitable package for shipping is the 56-lb. box lined with paraffine wax and heavy parchment paper. We pack the butter firmly and [illegible] with parchment paper and [illegible]t salt paste.

To insure the keeping quality of the butter we have good milk, ripen the cream properly, churn at a low temperature, wash twice, salt seven-eighths of an ounce to the pound, work twice, pack firmly in tub or box, exclude the air, and keep the butter at as low a temperature as possible. —Mrs. S. H. Pugh in Farm and Dairy.

Keep the Heifers.

If you must sell some of your cattle, keep as many of the best heilers as you possibly can. If you have a lot of steers on your place and your neighbor is sacrificing a lot of good heifers, sell your steers and buy his heifers. Your steers will bring as much—perhaps more—than you will have to pay for the heifers, and you will have a foundation for a breeding herd, and breeding herds are going to be valuable in the very near future.

WINDSOR TABLE SALT

"Waiter, this is better salt than we get in the States".

"Yes sir, that's what all the tourists say.

We always use Windsor Salt in this hotel. In fact, practically everybody in Canada uses Windsor Salt for the table."

"There, my dear, is a hint for you.

Now that we are going to live in Canada, we must start our housekeeping right with Windsor Salt.

Put the name in your 'want book'—

WINDSOR TABLE SALT". 45

LIVE STOCK.

Falling of the Calf-Bedprolapsus Uteri

At one time the means at our disposal for securing the retention of the uterus or vagina that had been relieved were less efficient than they are to-day. They took the form of trusses, generally improvised for the occasion, or sutures were employed, generally ineffectively, because badly inserted. Now we have available a cheap and handy instrument, which is easily applied and is very effective, in the shape of West's vulval clamp. This is made in different sizes, to suit mares, cows, ewes and sows, and should be kept on hand for use in emergency on every breeding farm. After the return of the organ the cow should be kept standing for some time with her hind parts higher than the fore-end, for just as this favours reposition so it favours retention.

TRUSSES.

It is hardly likely that there will be a properly constructed truss available, for it would hardly pay, except in the case of the large stock-breeder or dairyman, to invest in a Gowing or other approved pattern. These can, of course, be easily employed when the emergencies arise, or when a cow is suspected of being likely to put out her calf-bed. Most likely a truss will have to be improvised, or sutures depended on, unless the precaution has been taken to provide for emergency by having at hand one of the clamps referred to above. A truss can be improvised with waggon-ropes, the method of fixing which is thus described by Law:—"Take two ropes, each more than double the length of the animal, bend each double, and intertwist them at this bend so as to circumscribe an oval opening a little larger than that of the vulval; this having been adjusted to the orifice the two upper ends are carried around the rump, crossed over each other repeatedly in their passage along the back, and finally tied to a collar previously placed round the neck; the lower ends are carried down between the thighs, one on each side of the udder, and forward on the sides of the abdomen and chest to be fixed to the collar. It may be made as tight as seems necessary, and will tighten at every effort at straining, so that eversion becomes impossible. It may be made more secure by attaching the ropes to a surcingle as well." On hop-growing farms, where the material has been available, we have improvised a truss out of hop-pocketing. Taking a doubled piece, about eighteen inches wide, this is passed under the tail, drawn tightly round the animal, sewn at the chest, and kept from slipping down by broad straps of the same material over the back and withers. The pessary is another means of retention, and a quart champagne bottle is sometimes employed, the neck end being towards the vulval opening.

CLAMPS AND SUTURES.

With reference to the employment of sutures, if sufficiently stout and properly put in, they are fairly effective. The mistake usually made is in having the material too thin, not taking a deep enough hold, and in sewing the labia together, so that each stitch passes through the lining membrane of the vulval. This should never be done, whether in the case of cow, sow, or ewe, because it causes irritation, sets up expulsive efforts, and may cause inflammation. The sutures should be put in with a deep hold well outside the labia, almost to where the hair begins, and carried from side to side, knotting each stitch across the vulval opening so as to form a close network over it. A leather bootlace makes a good suture material, and is much less irritating than string, which is commonly used. With further reference to the use of the prolapsus clamp, it is preferable to sutures in every way. Being of plated metal and perfectly smooth, it can easi,y be sterilised by means of boiling water, it can be applied "in once," and with less pain to the animal and labour to the operator than the insertion of a number of sutures; the sharp teeth cause less irritation than suture material, and the fine screw arrangement permits it to be adjusted to any degree of tension, either quite closing the vulval opening, or permitting the easy escape of urine and uterine discharges. In cases of chronic eversion of the vagina we have had both cows and ewes wearing these instruments for weeks, while fattening for the butcher, without displaying any inconvenience. Further, the instrument is easily removed and replaced whenever occasion arises, which cannot be done with sutures.

When all efforts to return the uterus have failed—and when it has been out for some time before detection and has become enormously enlarged, they do sometimes fail—there remains only amputation. This has been successfully accomplished, but need not be described here, as it is the work of the veterinary surgeon. In deciding upon this operation it must be remembered that if left alone the cow is certainly doomed, because the protruded organ will mortify, while if amputation is resorted to at once the animal may possibly recover and be fed for beef. After treatment in cases of successful reposition and retention consists in careful nursing, the use of antiseptics locally, and the administration of remedies calculated to keep down inflammation and prevent blood-poisoning, especially wherewhere the organ has received injury during its exposure or return. For this purpose salicylic acid has proved most effective. Unless there are special circumstances surrounding the case, such as superexcellence as a milker, or a high commercial value on account of pedigree, no attempt should be made to breed from a cow that has once suffered from this lesion. In many cases recovery is so complete that the animal is quite capable of breeding again, but there is a distinct risk of a recurrence, and at calving time such animals should be carefully watched and put into a truss, and every effort made to prevent straining. The mischief is that the recovered cow is often sent to the bull again, and sold when forward in calf, or "springing," without any intimation to the purchaser as to what happened at the last calving. If this was given there would either be no deal or a bad price, and the man who foolishly sends such a cow to bull should be honest and calve her down himself.—Pateley Bridge.

Treating Hogs for Lice.

Lice are frequently introduced into the herd when new breeding stock is purchased. It is always best to examine newly purchaeed stock before turning them with the herd. The louse is gray in color with black along the side of its body. It is from one-eighth to one-quarter inch long when full grown and is therefore easily detected with the naked eye. The presence of large white eggs or "nits," on the hair is sufficient indication that the animal is infected. They may be suspected if the hogs do considerable scratching, particularly after night. The lice will be found in greatest numbers back of the ears, behind the forelegs and around the root of the tail.

If the weather is warm enough and a dipping tank is convenient, the animal should be dipped in any of the common coal tar dips.

If these are used, however, it will be necessary to repeat the treatment during the second week, as the dip has no ill effect on the eggs. The eggs generally hatch in eight days and two dippings are usually sufficient. This depends, however, on the care taken in dipping and the hogs should be examined after being dipped to prove the absence of lice.

Where there are only a few animals to be treated or when the weather is cold, hand-dressing will have to be resorted to. Kerosene emulsion seems to give the best results in general for this purpose. The emulsion is made as follows: Take 1 pound of soap and dissolve in two gallons ;of water. When thoroughly dissolved, add one gallon of kerosene. This will make enough for treating 15 to 20 hogs. If a spray pump is used, to apply the wash, dilute the above solution with 5 parts of water. If a spray pump is not convenient, dilute the solution with 15 parts of water and apply with a brush. Thorough rubbing with the brush loosens many of the eggs so that it is seldom necessary to give more than a second treatment in this manner. This treatment commends itself as being simple effective and inexpensive, save as ;to the element of time. Care should be taken in cold weather not to allow the hogs to get out in the wind until they are thoroughly dried, as they are quite susceptible to pneumonia.—Iowa Agriculturist.

SOLID GOLD WATCH PUZZLE

GREAT OFFER BY A RESPONSIBLE FIRM. IT COSTS YOU NOTHING TO TRY.

To any person who can supply the correct names of these two well-known Canadian Towns, and fulfil conditions below, we offer our 15-Dollar Lady's **SOLID GOLD WATCH**, fully jewelled. Stamped, as a **FREE GIFT.** (Silver Watches are presented to Gents.)

Send your attempt, together with stamped addressed envelope for reply to FELLOWS & Co., Wholesale Watch Merchants, 79 Adelaide St. East, Toronto. The winner is required to purchase a Chain from us to wear with watch. The name of this paper must be mentioned. Prize-winners of last competition were :—

Mr. Lawrence Fisher, Union St., Waterloo, Ont.

Mr. J. Ferguson, 52 Marquette St., Sherbrooke, Que.

J. W. Copeland, of Dayton, Ohio, purchased a bottle of Chamberlain's Cough Remedy for his boy who had a cold, and before the bottle was all used the boy's cold was gone. Is that not better than to pay a five dollar doctor's bill? For sale by all dealers.

Be sure to address your Correspondence to the Maritime Farmer's new home, Clarence St., St. John, New Brunswick.

Temperature in Health and Disease.

In connection with the table of average normal temperatures of the principal domesticated animals, and their slight variations due to ordinary physiological influences, it may be pointed out that forty years ago, or less, the test for the existence of fever and inflammation in animals under treatment for disease was the state of the pulse and such indications of increase or decrease in the internal temperature as could be gathered by putting the fingers into the mouth, and that of the body surface by feeling it. It is astonishing what the old-fashioned cow-leach was able to do in this respect.

Now we have a much more reliable and sensitive instrument than the fingers, in the shape of the clinical thermometer. This cheap and handy little instrument is calculated to be of great assistance to the horse-man and stock-owner who does not understand much about the pulse and its indications in disease, for the temperature is something he can see registered, and the register remains fixed until the index is disturbed. The principles of thermometry are not difficult to master, and every animal owner, and especially anyone who keeps a large head of stock, may advantageously acquire and learn the use of this instrument.

There are several makes of clinical thermometers, but the essential features are much the same in all of them—a hermetically sealed glass tube with a bulb at one end containing mercury, a graduated scale with figures marked on it, and a self-registering index, which shows the internal temperature of the body of the animal on which it is used, and remains in position until a few vigorous shakes or jerks dislodge it.

The ordinary clinical thermometer used by the veterinary surgeon is the same as that employed by the medical practitioner, from whom it was originally adopted, but a few years ago there was brought out an animal clinical thermometer, suggested by Professor F. Hobday, F.R.C.V.S., which is best suited for the purpose of the stock-owner, because it leaves him less dependent on memory as to the normal or healthy temperature of the different animals of the farm. The instrument, which is sold at prices ranging from 3s. 6d. to 10s. 6d. by veterinary instrument makers, is graduated from 95 to 112 degrees, and each degree, divided into fifths, has arrow marks indicating the average normal temperature of the several domesticated animals.—Pateley Bridge in Farm and Home.

Insurance Against Blackleg.

Satisfactory immunity is readily granted to cattle at the present time against the ravages of blackleg, or symptomatic anthrax, says a government bulletin, through the injection beneath the skin of the susceptible animal of some material containing the living but weakened germ of the disease. The amount of this material is so graduated that it causes the prompt development of the very disease that is being guarded against, but only in a mild and comparatively harmless degree. There is considerable elevation of temperature, and there may even be limited tumor formation, but only in the rarest cases does this type of blackleg, that has been intentionally produced by inoculation, progress so far that the animal is seriously injured. The value of artificially produced immunity in the struggle against this disease is shown by the fact that the loses of young cattle which reached from 15 to 20 per cent in certain infected localities previous to the discovery of vaccine treatment, have been reduced to one-half of one per cent at the present time where vaccines are used.

Gathercoal Barn

Shingles Catch Fire

One big, live spark, and shingles catch like kindling wood. Besides, the thousand curled-up edges give the best sort of lodgment and starting place for flying brands.

One-half the fire loss would be prevented if shingle roofs of adjoining buildings did not *catch* sparks blown from fires.

NEPONSET

PAROID ROOFING

Is Made to Resist Fire as Well as Water

Buildings covered with smooth, fire-resisting NEPONSET Paroid stand undamaged next to big fires when a shingle roofed building would be doomed. You can greatly reduce danger of fire if you use NEPONSET Paroid, which lasts longer than shingles and costs less to buy and less to lay.

You make a permanent investment when you buy NEPONSET Paroid; roofs laid 13 years ago are still good. Farmers who have studied roofing requirements are putting it on their best barns—on all buildings worthy of the best roof protection.

NEPONSET Proslate is the NEPONSET Roofing for your house. Looks like rich brown stained shingles—but is without their defects.

If you have a roof problem, solve it right. NEPONSET *book of facts may help you.* Today *is the day to send for it.*

This Food-Tonic Quickly Restores Strength

After a serious illness, ordinary food should be supplemented by a strengthening tonic. For this purpose

NA-DRU-CO Tasteless Cod Liver Oil Compound

is recommended very highly. In its preparation the disagreeable flavour of the natural Cod Liver Oil is entirely removed, while its well known nourishing and tissue-building qualities are retained. The use of hypophosphites together with the active principle of Wild Cherry and the Tonic properties of Tolu, and Extract of Malt is also part of which aids in the assimilation of other foods.

Children in particular enjoy the pleasant flavor of Na-Dru-Co Tasteless Cod Liver Oil Compound, and quickly regain health and strength when Nature is aided by this scientific food-tonic. Your Druggist has it in 50c. and $1.00 Bottles.

National Drug and Chemical Co. of Canada, Limited.

THE HORSE.

Grooming Horses.

In dealing with this question, a distinction should be made between "light" horses which the farmer uses for his business or pleasure, and the horses at work on the larm. In the case of the farm horse, a good brush-over is all he usually gets in the way of grooming, and is as much as he really requires. The light horse, on the other hand, requires a good deal of grooming, and it should be borne in mind that though a clean, shiny and smooth coat is one object in the case of the light horse, it is not the ference between the stabled animal and the horse in a state of nature. As long as the horse remains in a state of nature, taking only the exercise required for gathering his food, and feeding only on laxative diet, grooming is not needed, because the debris of the food and the excretions of the system are carried off mainly by the action of the bowels and kidneys. The cart-horse, whose work is slow, can get on with very little grooming; the hunter and the race-horse, on the other hand, whose whole systems are developed to the utmost, require much more grooming than is necessary for the carriage and the ordinary riding horse.

By means of glands in the skin an albuminous fluid termed "sweat" and the loss of fat which it involves in a fatty material called sebum are secreted. This and the dandruff, or powder removed from the skin by brushing, are important when considering the need for grooming more or less. In the case of exposed horses the presence of this greasy secretion prevents the penetration of rain, and it also guards against undue loss of heat. Free grooming, therefore, by the loss of fat which it involves in the removal of the dandruff, exposes the animal to the risk of chill. How much or how little of this fatty material is present will depend on the diet. Fed on hay alone, there is very little in the dandruff, while on oats there is a considerable amount, The heavy farm-horse usually gets a great deal more hay than oats; he moves at a slow pace, and his work exposes him to the elements very much, in addition to which he is often turned out all night to grass. It is much more important that he should be ted and his food be partly digested before he is turned out to work than that he should undergo a lot of brushing and currying.

The first thing the driver should do on reaching the stable is to give the horses as much water as they care to drink, and throw them a feed of corn. The dung should then be mulched out, together with the soiled straw, the bedding tucked up under the manger, the shoes examined, and the stalls swept out clean. If the quarters are very dirty, they should be water-brushed. A little litter is then shaken down under the feet.

The tools most commonly employed in the farm stable are the currycomb and dandy brush—the body brush, used so freely in the light-horse stable, being rarely used, and not really necessary. The currycomb should be employed lightly to loosen and separate hair matted with sweat or dirt, or to remove dried dung from the quarters. In the light-horse stable it is an instrument employed solely to clean the body brush of dust and dandruff, and should never be used on the skin. It will set some thin-skinned, high-couraged horses all ends up, and even in the case of the thicker-skinned, less sensitive, and more docile cart-horse it should not be rubbed to and fro into the hair and ground into the skin in the manner commonly practised. The actual cleaning should be done with the whisk-brush, commonly called a dandy. The horse should be turned in the stall, and, beginning at the near side, the head and neck, and parts of the body as far back as behind the shoulder, should be well brushed. taking the brush in the opposite hand the off-side should be similarly treated. Special attention should be paid to the poll, the crest or root of the mane, and the hair on the legs. In stables where the legs are not washed on returning from work there may be a good deal of dirt to remove from them, and there is no item of more importance in grooming heavy horses than attention to the proper cleaning of the legs and hair about the heels. To a limited extent the currycomb may be employed here to loosen the dirt, and where the horse has an abundance of long silky "feather" the mane comb may also be used with advantage. Having finished with the fore-end, the horse should be again turned to the manger, and the body, quarters, and hind legs well brushed. The root of the tail is a part much neglected, and very often its dirty condition is the foundation of that irritation which causes the animal to rub it against the stall-post or other projection, of course causing soreness and loss of air.

After all this brushing there will be a considerable amount of light dust settled on the surface of the hair, and this is generally removed by a wipe over with a coarse rag or piece of sacking, which also gives more or less polish to the hair. In the light-horse stable this polishing is done mainly with a wisp, finished off with a dry, soft rubber, but the wisp is almost unknown in the cart-horse stable—more's the pity, for it is an excellent polisher of the coat, and a grand stimulant to the skin. Its principle is friction, and friction will polish a stone. Wisps are made either of hay or straw, the former for preference, twisted up into a long band, and then into the form of a pad in a fashion easier done than described. A cart-horse may have too much brushing, but hardly too much wisping, and as it is hard work he is never likely to get it. After wisping, the mane and tail should be combed out and lightly water-brushed, the eyes, nostrils, duff, and dock sponged clean, and a general wipe over given with a soft rubber. If any vigour has been put into the business, the horse should then look well, and be sufficiently clean in his skin for his welfare and his work. To make his labour effective, and to produce the best results with the least expenditure of power and in the shortest time, the man should aid his muscles with his weight. He should stand well away from his horse, and lean his weight on his brush or wisp, especially the latter, using long, clean, steady strokes with plenty of weight behind them. This pentrates the coat more efficiently, polishes it more effectually, and is really less exertion to the man than if he employs his muscles only. Except in the case of the currycomb used to separate sweaty hair or a coat caked with dirt, the working should follow the natural direction of the hair. It is less irritating to the horse, and more effective as regards cleaning. If the horses are turned out at night during the summer, or run in open yards, less grooming is required than with the stabled animal. The night temperature is often low, and the weather often wet. The great thing, then, is to get them up early, and give a feed of corn before they are yoked, letting the grooming consist of a light brush over and in making them look as well as circumstances will permit. The grooming finished, permit the horses to stand feeding until the time arrives to get away to the fields to be ready to start into work at the customary hour.

What is done at night when they return must depend a good deal on circumstances. It is desirable to leave horses dry and comfortable, especially about the extremities, but we are not believers in worrying around horses for hours after their day's work is over, and in these matters there is no great difference between horses and men. It is no good having men about the stable half the night; get them there in the morning if you want your team to look well, work well, and last well. We have said nothing up to now about the "light horse," except by way of comparison, nor if he is engaged in agricultural work is it necessary. If his feeding and work are identical he may be treated on similar lines, but if he is used for fast work and is fed to enable him to do it, his grooming must be of a more thorough character. We must spend more time on it, and employ different tools and methods.

A Docked Horse.

Some of us Christian people have woefully failed in sturdy opposition to wanton cruelty, to suffer the return of a practice which should have passed with the dark ages. See the noblest of our animal brethren, the horse, deformed and tortured to please a whim of degenerate taste. A docked horse is such a monstrosity, artistically, that it is astounding that those claiming even rudimentary taste can regard it with even the least degree of allowance. Artistically, a docked horse is in the same plight as a bird without a tail, the most unbalanced, forlorn creature that instinctively hides itself for very shame and self-disgust.—James H. Ecob, D. D.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:
SPLINTS
CURBS
SPAVINS
ENLARGEMENTS
COUGHS
COLDS
DISTEMPER
GLANDERS
FOUNDERS

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR:—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.
W. A. C. RANDALL, M. D.

MESSRS FRASER THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASER THORNTON & CO., Cookshire, Que.

DEAR SIRS:—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

PILES CURED at HOME by NEW Absorption Method.
If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Sick headache is caused by a disordered stomach. Take Chamberlain's Tablets and correct that and the headaches will disappear. For sale by all dealers.

POULTRY.

Time at Hand for Separating Boarders From Workers.

The time has arrived when the layers and the boarders must be separated if the poultry is to pay for its keep and a profit as well during the winter. Every unprofitable bird should be disposed of as soon as fitted for market, barring, of course, the best of the cockerels, which are to be saved to breed with next year, or to be sold in the spring for breeding purposes. No matter what the breed is, the cockerels that come nearest to the requirements of the American Standard of Perfection are the ones that should be kept, and not too many of them; this of course depending upon the circumstances in each individual case. The average farmer will not dispose of more than half a dozen cockerels to good advantage in the spring, though he might sell many more at a good price if he advertised skillfully and judiciously. The rest of the male birds should go as prime roasters at Thanksgiving, or certainly not later than Christmas, and ought to bring a good price, being properly fattened.

These birds should be placed in a pen by themselves, where they are confined to narrow quarters, being fed liberally with a wet mash, consisting largely of cornmeal, some fat meat, and a liberal supply of cracked corn, milk, table scraps and whatever fattening foods are easily obtained. A few weeks of feeding in this way will add materially to the weight of the bird as well as the quality of the meat, and if the best market is sought, to the profits on each individual bird. Keep the birds that are colored right, brilliant in plumage, active, that crow at an early age, that dominate the flock, are sturdy of build and have brilliant eyes, and send the rest to market after a time in the fattening pen.

The same rule applies to the pullets when properly adapted. An expert can tell at a glance which of the pullets may reasonably be expected to become good layers, and will quickly dispose of those that are likely to become mere boarders at the expense of the rest. Actual value as layers can be positively determined only by trial and records kept with trap nests, but the careful observer who uses good judgment need make few mistakes, and can keep his flocks fairly clear of drones. The well-bred birds that are bright of eye, brilliant of feather, with plump clean legs, breast well covered with firm flesh, fluff, broad and well formed, those that are first off the roost in the morning, last on it at night, and busily scratching and singing all day long, are the ones that will make good layers and money makers when the cold winter comes; and these are the birds that should be given good care, good food and a good place to spend not only their days but their nights; and the reward for the attention and care given them will be ample.

The listless pullets, those that are dull of eye or narrow of breast or stern, those that eat as though it were a task instead of a pleasure, should be separated from the others and prepared for market as soon as possible, but they should not be fattened in the same pen with the cull cockerels. They will do much better by themselves, and it will be better for the cockerels too, to keep the two separate.

It is a mistake to kill all of the yearling hens every fall, or to get rid of them in any way, though many breeders do it. A few hens will lay well in their third year and amply pay for their keep, besides furnishing the very best of eggs for hatching, and many hens will pay a good profit the second year from eggs for market alone. Those that have laid well the first year and show little or no diminution in activity the second summer will be profitably kept through the second winter if well provided for. It is better to keep them separate from the pullets and watch them carefully and get rid of any that are not laying well by December, after moulting. Do not try to force them, but give them plenty of green food and some meat, keep a vigorous cockerel that is strong in the points where they are weak, and your eggs are likely to hatch well and the chickens to be strong, in the spring. Do not use pullets' eggs for hatching purposes when it can be avoided. You may have good luck with them in every way, but the chances are much against it.

When you look your yearling hens over in the fall, and those that are older, if you have any, give them a thorough inspection for physical defects. If you have many hens, there are likely to be some that have distended crops, or that bag down behind, or that have sore back either through roughness of the cock birds or from other causes, or that show signs of weakness in one way or another, and these should be quickly sent to market to avoid serious difficulties later. If there are signs of disease that are likely to injure the carcass, the bird should be killed and burned or buried deep. It will not pay to attempt to cure such birds unless they have peculiar value as breeders, and even then the result will be of doubtful value.

Get rid of all your weak birds before winter sets in in real earnest, and give your strong healthy birds the additional room; be sure they are free from parasites at the outset, and keep them so; give them a variety of food, including meat and green stuff of some kind, and plenty of it; keep the quarters clean, and occasionally dispose of a bird that is not coming up to your expectations as a layer, and there is no reason why the egg basket should not contain an abundance of eggs all winter long.

The following is a good rule to adopt at this season: "When in doubt, cull."—H. L. Goodwin in Maine Farmer.

Poultry Fattening.

A bulletin entitled "Fattening Poultry," describing successful methods of fattening poultry on a large commercial scale and giving complete data on the feeding of over 100,000 birds, has just been issued by the United States Department of Agriculture. It gives information of operations on an extensive scale, and so far as known, is the first publication showing the cost of producing a pound of gain in poultry.

"The successful feeding of poultry depends largely on the ability of the feeder to notice the condition of the chickens on feed," is one of the fundamentals laid down by the bulletin. "The common practice in poultry packing houses is to feed each lot 17 days or less. Most of milk-fed chickens are fed 14 days. Practically all of the special feeding in this country involves the use of milk, which produces the 'milk-fed chickens of the market. Milk, while the least expensive, seems to be the most essential constituent of the ration, and when a feeder cannot get milk in some form he generally does not attempt to fatten poultry commercially.

"Crate feeding from troughs is the method employed in this country by most of the large fattening establishments, with 6 to 10 fowls in a crate. Birds fed only for a short time may be forced on highly concentrated feeds, whereas if fed longer they may need a ration containing a greater variety and less concentrated.

Get the Hens Back on the Job Shelling Out Eggs
We guarantee you will cut the molting period in half if you give your hens
Pratts
Poultry Regulator
They will be back at work again laying more eggs than ever. Pratts Poultry Regulator is a Conditioner, Regulator, Egg Producer and prevents disease by keeping the digestive organs working properly, regulating the bowels and purifying the blood.

25 lb. pails $2.50. Also in smaller packages and 100 lb. bags. If your dealer cannot supply you, write us.
Pratts Cholera Remedy is guaranteed to prevent and cure this disease. Pratts Lice Killer will positively destroy lice.
We will mail you free copy of our 1911 Poultry Book on request.
PRATT FOOD COMPANY OF CANADA LIMITED
Dept. 68. Toronto, Can.

Milk For Laying Hens.

Milk is excellent for both breeding and laying hens. It contains lime, albumen, and other elements necessary for the production of eggs. On the farm, skim milk is usually abundant and forms one of the cheapest and at the same time one of the most valuable foods to be had for fowls. Glabbered milk may be made into cottage cheese where a large amount of it is to be secured. It may also be fed in the raw state in limited quantities or in the mash. Do not feed it with the calculation of its forming their sole drink. Milk creates a thirst rather than quenching it. Butter milk is also excellent for laying hens, but if fed too liberally it has a tendency to produce looseness of the bowels.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Man Behind the Smile.

I don't know how he is on creeds,
I never heard him say;
But he's a smile that fits his face,
And he wears it every day.

If things go wrong, he don't complain
Just tries to see the joke.
He's always finding little ways
Of helping other folk.

He sees the good in every one,
Their faults he never mentions;
He has a lot of confidence
In people's good intentions.

No matter if the sky is gray,
You get his point of view;
The cloads begin to scatter
And the sun comes breaking through

You'll know him if you meet him,
And you'll find it worth your while
To cultivate the friendship of
The man behind the smile.

Love's Barrier.

(Continued from last issue.)

"You will have to take your place, dear, and why not at once? It will be better so. Everybody will expect it. It is natural that at first you will feel a little strange. People will be very kind. I love the villagers. They are so simple, outspoken and true. They never say behind your back what they are afraid to say to your face. I think moorland folks are like that. There's something in the wideness of things that helps them."

"I shall say and do the wrong things all the time when I do anything at all, unless you are there to help me," said Helen decidedly, pausing with the soap in her palm, and the water dripping from it. "It isn't fair. I told Claude it must be a condition, and you know I said it in my letter to you, too."

"Yes, you did; but you see, dear, neither of us took it seriously. Both my brother and I felt from the first that I should have to go. I don't feel in the least bitter about it, and, after all, the Court Farm is not very far off. You can see me easily as often as you wish."

"How far is it?"

"About three miles up in the Fells direction, not very far from Mardocks. But there, that doesn't help you much. You will soon learn the geography of the place when Claude begins to take you about the parish. We have to think what will be best for him, dear. I know that he prefers to have the house and you to himself. Any man would, and the sister who outstays her welcome is, well, to put it quite plainly, a fool for herself."

Helen ruefully dried her face on the rough surface of Jane's best huckaback towel. There was nothing soft or luxurious in the whole of the house; everything had been purchased with a thrifty eye to its wearing qualities; and there had been no stock of fine damask or linen or old silver to come down, the sort of legacy which adds grace and distinction to a homeplace.

For the first time Helen began to wonder what the early surroundings of the Secretans had actually been—the present product of their environment seemed so hopelessly common. It was a good name, and though he had spoken of his poverty, she had not taken him so literally. She had been in many country parsonages, some of them poor and homely enough, but always there had been the redeeming touch, the air of refinement, the indescribable something which marks the surroundings of the gently born. She had never seen anything like this.

Jane's cheerful voice went on gathering strength and cheerfulness now that the ordeal was actually over.

"You will find Hannah very good as girls go. She belongs to Midcar, and I trained her myself. She really begins to cook quite fairly well, simple, plain things, of course, such as we have been accustomed to and can afford, and we have a woman from the village once a fortnight for the washing. Her name is Mrs. Ridd. She can always come for an extra day when you want her. The Yorkshire folk are very hardy and good workers. I never have to complain that any of them are unwilling."

Helen let the cloud of her hair fall about her shoulders, and Jane, leaning forward, fingered it lovingly.

"How beautiful! It has a red-gold light on it in parts," said Jane, who loved beauty, but could not create it. "Some folks 'as 'air an' some 'asn't," she added humorously. "Now look at my bit of a scrag. I can't do anything with it, however hard I try."

"That's what's the matter, dear, you try too hard," said Helen, peeping through the red-gold cloud. "Hair was never meant to be screwed and pinched like that. It wants coaxing and petting. Some day I shall do it all over again for you and take all that bead-trimming off your frock," she added daringly. "What's that?"

"Hannah is trying to ring a gong we never use!" cried Jane, laughing almost hysterically. "Can't I help you? We must hurry; Claude will be getting quite impatient while we are enjoying our women's talk. He hates to wait—let me help you."

"We can't hurry," replied Helen solemnly. I'm sorry he hates waiting, but to-night he mustn't mind. Don't you love women's talk, Jane, when women understand one another? It's lovely, I think, and it's quite lovely to have you."

As she deftly wound the thick coil about her shapely head, she bent suddenly forward and kissed her new sister again, Jane rose rather hurriedly her eyes full of tears.

"I'll just run down, dear, and see that everything is quite right, and tell Claude you won't be a minute. We are dining to-night actually in honour of you. Usually we have high tea, you know, at half-past six or seven, according to what there is to do in the evening."

Helen nodded, her mouth full of hair-pins, which made Jane remember Lydia Rash. Her heart was very light as she sped down the stairs. With such a delightful creature all things were possible. She foresaw that the personal loneliness from which she had suffered so often, not quite understanding the dull ache at her heart, was over: She was going to be Helen's actual equal and ally, and they would never misunderstand one another. She was still smiling when she went through the open door of the dining-room.

"Well?" said Secretan with a note of strain in his voice.

"It's all right. She'll be down in a minute," said Jane, a little breathlessly. "I'll just put the plates on the fender. How lovely she is, Claude and how sweet. I've never seen anybody quite like her. She will astonish people very much."

Secretan's face lit up with the joy of pride and possession.

"I felt sure you would admire her, Jane. Tell me what she said. Does she seem pleased with things? She came out of something very different, I assure you. Never have I thought the house so bald and ugly till I tried to look at it through her eyes."

"Oh, she'll alter it quickly enough," replied Jane, bending down to the fireplace. It isn't that exactly. It's the unexpectedness of her, which makes her quite fascinating; but I can't think, really, how you dared ask her to marry you. Why, she simply might have married anybody."

"What were you talking about?" he asked jealously. "I've been listening to your tongues wagging for the last quarter of an hour."

"Oh, nothing but women's talk, dear. She was trying to persuade me to stop here, but it's impossible, of course. Tom Courtney is coming for me to-morrow afternoon at three o'clock. I thought that would give Helen and me a long enough morning to go over the house together."

She stood up beside him with her hands lightly clasped in front of her, her kind, strong face still illumined with an inward joy.

'She will be a power in the place if—if things go well with her, Claude. I do pray God they will go well. But——" and here she lifted her eyes with a sudden boldness to his face. "You will excuse me saying this just for once, Claude: I am going away to-morrow, and will pass out of your intimate life altogether. Helen will never be driven. She must be coaxed and petted," she added, thinking of Helen's own words regarding a more trivial matter. "She is a woman who knows her own mind, and if she is left alone, she will come quite all right."

"There's some hidden meaning in these words, Jane—what are they?" he asked quickly.

Jane made a little deprecating gesture.

"If there is a hidden meaning it is a very simple, innocent one, dear," she said in a low voice. "You have had your own way all your life. Our dear mother never crossed you, and I have followed just in her lootsteps. Perhaps I ought to have been a little different. You will not be able to go on just as you have been doing, dear, because Helen is one who will expect consideration and carve out a way for herself. She will have her own thoughts, her own ways, her own ideals. But there, pray forgive my little homily. It's my last chance, and please God, love will teach you, and Midcar Rectory will be a happy home, to which people will turn naturally in their joys and their sorrows. Yes, please God, that is what it will be."

The door opened and Helen came in. She was looking very radiant with the heightened colour which excitement and the cold moorland water had left in her cheeks. Secretan sprang forward to set her chair, but with a little smiling gesture she declined to sit at the head of the table.

"Not to-night, dear; I am only a guest, a guest at the inn," she added; and somehow the words sent a little chill across the table, and even Jane's uplifted spirit sank. She did not make any demur, however, and even while Secretan would have laughingly insisted, she slipped into her place and the meal began.

Pictures in Home Decoration.

Nearly every household is well furnished with pictures; the question is, What shall be done with them? For their preservation, they must be framed but how? In general, we find the

tea is the result of care and experience in blending—must be the combination of fine flavor, smooth strength and richness. Because all these elements are so generously included in Red Rose Tea it well merits the term "good tea."

94

AFTER SUFFERING YEARS

Cured by Lydia E. Pinkham's Vegetable Compound

Fox Creek, N.B.—"I have always had pains in the loins and a weakness there, and often after my meals my food would distress me and cause soreness. Lydia E. Pinkham's Vegetable Compound has done me much good. I am stronger, digestion is better, and I can walk with ambition. I have encouraged many mothers of families to take it, as it is the best remedy in the world. You can publish this in the papers." — Mrs. WILLIAM BOURQUE, Fox Creek, N.B., Canada.

The above is only one of the thousands of grateful letters which are constantly being received by the Pinkham Medicine Company of Lynn, Mass., which prove beyond a doubt that Lydia E. Pinkham's Vegetable Compound, made from roots and herbs, actually does cure these obstinate diseases of women after all other means have failed, and that every such suffering woman owes it to herself to at least give Lydia E. Pinkham's Vegetable Compound a trial before submitting to an operation, or giving up hope of recovery.

Mrs. Pinkham, of Lynn, Mass., invites all sick women to write her for advice. She has guided thousands to health and her advice is free.

appropriate color of a frame in the picture itself. For example, a brown photograph looks well in brown of a shade half way between its lightest and its darkest tone. Black and white prints are best set in gray. Water colors and etchings with white mats are beautiful in bands of gold. Nowadays mats, however, are often discarded. Dull gilt is admirably suited to oils, although black may be employed.

The great danger in framing is that attention will be withdrawn from the picture itself. That danger forces us, in hanging our picture, to avoid large-figured or bright-tinted backgrounds, since the wall must be subordinate to its decoration.

Again, the obtrusive and treacherous cord must give place to an almost invisible wire; and it is amazing how heavy a weight fine wire will sustain. One nail is no longer considered the proper support for a large picture. Strength is secured by two hooks for the wire; thus the triangle it formed when leading up to a single point is exchanged for parallel lines, in harmony with those of the wall.

Some decorators feel that a massive piece of furniture should stand beneath a large painting to give apparent stability. Certain it is that a tiny ornament under a flicture of great weight seems in danger of being crushed.

Small views ought, indeed, to be grouped together, with care that the colored and the uncolored be combined separately. Then the groups themselves should be balanced. In fact, all pictures should be so massed that the light and the shade of any one or all may be nearly equalized. Of course, the effect of both natural and artificial light must be carefully noted.

Naturally the faces of our best beloved will be cherished in private or living room, instead of guest chamber or parlor. Yet an old portrait of homestead view, artistic in workmanship, ought not to seem obtrusive even to strangers.

The center of a picture should be nearly level with the eye, above it rather than below. Angels and madonnas, though, may perhaps be allowed to hover on airy hights, and a mountain may rear itself ceilingward. Streams of water pouring down upon our unprotected heads are peculiarly dangerous to peace of mind.

It is better to divide our treasures, and line hall or stairway, than to give parlor or living room walls a crowded appearance. Every view, every portrait needs space for itself in order to win recognition.

Time, study and patience are required to frame and hang pictures properly, but the end crowns the work, for thereby the home gains not only ornament but inspiration.

Home or House?

The very first requisite of a home is happiness. To make a happy home atmosphere, there must be no fear. There must be no friction or discord. The furniture must not be too good to use, the floors too beautiful to walk upon. The divans must be couches for repose, and if a tired body feels like lying down upon a mattressed bed in the daytime, no terror of disarranging lace covers and wonderful shams should stand in the path to rest.

A woman of tact and resource can manage to make her home comfortable and keep the appetites of her family appeased, while she allows each member of it to find comfort and freedom within its precincts, and retains leisure for the development of her mind. It is all a matter of disposition and excutive ability—and tact.

Don't be a Whet Hen.

Early in my married life I decided that there was more work here than I could possibly do, so I began studying which to do and which not to do. I finally decided it did not make much difference just so the most important things were done, and I kept my temper, not that I was in the habit of losing it often, but that I would not allow the duties of home to make me fretful. I settled the question early that my children should not in later years think of mother as "an old wet hen," and of home as a place where mother worried herself and every one around her, about the things that wouldn't stay fixed, and the things that couldn't be fixed.

I want to tell you mothers, not harshly, however, that many of you make your children miserable, and you don't know it, by fretting so much about the work and if you were to ask them after they had homes of their own, what you guess mother is doing, they would say, "Oh, just fretting around there—you know she always frets, but—it wouldn't be mother if she didn't fret." You see she wouldn't seem natural to them if she didn't fret.

Now, young mothers, I ask you with a heart full of love to consider this subject. You are young and can keep yourself from falling into this habit, and for the sake of your children and the peace of your home don't be "an old wet hen."

A GROWING SCHOOL IS

FREDERICTON The Business COLLEGE

W. J. OSBORNE PRINCIPAL.

A Sencible Merchant

Bear Island, Aug. 26, 1903.
Minard's Liniment Co., Limited.

Dear Sirs,—Your traveller is here to-day and we are getting a large quantity of your MINARD'S LINIMENT. We find it the best Liniment on the market making no exception. We have been in the business 13 years and have handled all kinds, but have dropped them all but yours; that sells itself; the others have to be pushed to get rid of.

W. A. HAGERMAN.

Last Year Was by Far the Best Year We Ever Had.
Last Month Was By Far the Best September We Ever Had.

Reasons: Up-to-date courses of training, superior equipment, elegant new premises, best of all, our strong staff of specially trained teachers.

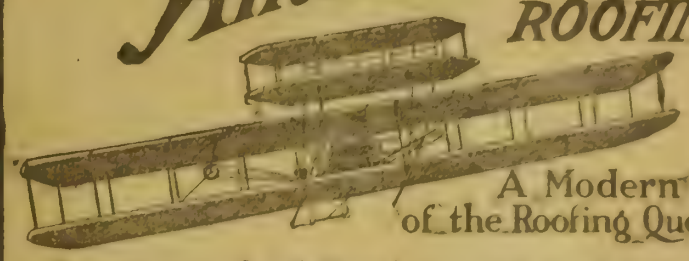
Send for catalogue.

S. KERR

Principal.

If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale by all dealers.

Amatite ROOFING



A Modern View of the Roofing Question

Tin makes a good roof *if you paint it.*

Canvas makes a good roof *if you paint it.*

Any felt makes a good roof *if you paint it.*

Even paper makes a good roof *if you paint it.*

But Amatite makes a good roof if you *DON'T* paint it.

On a painted roof, the paint is what gives the real protection. The rest of it has no function except to provide a smooth unbroken surface with no seams or cracks, to which the paint can be applied. Anything which has strength enough to keep the wind from blowing it away or the rain from beating it in, will be waterproof if you use paint enough.

Amatite Roofing, however, needs no painting. *It is a real roofing*—a roofing that can be left out in the rain without the slightest damage.

The wearing surface is mineral matter embedded into a heavy coating of pitch and never needs painting.

We shall be glad to send you a sample of Amatite free of charge if you will send a postal request for it to our nearest office. The sample will show you what the mineral surface is like.

Everjet Elastic Paint

A lustrous carbon black paint, very cheap, very durable—for protecting all kinds of metal and wood work.

The Care of Young Children.

Most doctors believe that the change from an exclusive milk diet to a more or less mixed diet should be very slow and gradual; the effect of the change being watched from day to day and week to week, bearing in mind that milk is the ideal food of the young child. Milk should be the chief constituent of the child's dietary until the sixth year; but beginning at the end of the second year, the milk diet should be gradually displaced by small quantities of chicken or mutton broth that have been skimmed of fat, rare steak, mutton chop, white fish, fresh vegetables, rice pudding, soft custards, cocoa, oatmeal gruel, etc. All kinds of pastry, confectionery and fried food should be excluded.

In feeding children in acute illness, Nature's method of induction of loss of appetite, obviously intended to prevent overfeeding while the digestive powers are weak, should be taken as a reliable guide. Delicate infants will sometimes withstand a serious illness with hardly any nourishment at all. Like fish they seem to sustain life on water; and this should be given to them very freely.

After a few days' illness, if food is still refused, an attempt should be made to have the child take small quantities of liquid food, such as freely diluted milk, toast water, albumin water, some artificial infants' food of recognized value, malted milk, etc.

Older children may be nourished on strained cereal, gruels, eggnog, chicken, mutton, or beef soup from which has been strained the solid constitutents, beef tea, beef jelly, water ices, ice cream, fresh fruit juice, etc. Great care should be exercised that all these foods are freshly prepared, and kept in a cool place, well-covered, in clean crockery or agate or glass dishes.

FEVER AND FEVERISHNESS IN CHILDREN.

Contemporaneously with cutting the teeth is a development of the nervous system, and similar changes occurring in the digestive organs, preparatory to the reception by the stomach of food other than milk. During this period these structures are particularly sensitive to all forms of irritation. It is not, therefore, surprising to find fever, convulsions, sickness and diarrhea common in infants cutting teeth. All or any of these symptoms may be caused by a chill to the surface of the body, from insufficient clothing, or by errors in diet.

It is to be borne in mind that acute illnesses may occur during the teething period; and that the fever which often occurs, is totally unconnected with teething. The rule should be not to credit "the teeth" with being the cause, until other causes for fever have been eliminated.

Tonsilitis is a frequent cause of fever in children. The throat should be examined as a matter of routine in all cases of feverishness. Irritation of stomach and bowels is a frequent cause of fever. The frequency with which children of all ages suffer from taking food unsuitable in quality or excessive in quantity, is well known; but the varied consquences of such injudicious feeding are frequently not recognized. It is surprising how the temperature may run up and the infant have convulsions simply from the irritation caused by a few undigested milk-curds, only to fall as rapidly to normal when this material has been gotten rid of.

Feverish attacks after children's parties are more common, and often of graver import than they were a few years ago. This often happens as a result of the pernicious custom of having the refreshments furnished by caterers, instead of having simpler foods prepared at home. It sometimes happens that the food furnished by caterers is not fresh; and the frequent use of tinned lobster and other foods is a serious menace on account of possibility of ptomaine poisoning.

BATHING OF INFANTS.

Do not try to bathe a child in your lap. Pad a table well with a folded wool blanket, and have some soft wool material for a covering blanket If the infant is feeble or the weather cold, a hot water bottle should be placed between the folds of blanket upon which the baby lies. If the table is large enough, place your bathtub on it; otherwise place conveniently on your right hand, on a chair or box. Place the fresh clothing to get warm and arrange toilet basket, towels and soap, oil, powder, etc, near the bathtable.

Have two washcloths, one for bathing the head, and the other for the rest of the body, in order to prevent possibility of contaminating the eyes. --Mary H. Tufts.

CARE OF THE TEETH.

Every year people are getting more and more familiar with the fact that good health depends largely upon good teeth. Horace Fletcher has demonstrated the necessity for chewing food thoroughly. We cannot possibly get proper nourishment from our food unless it be well masticated.

Not only good health, but good looks, demand well-kept teeth. Who has not seen an otherwise pretty face spoiled by poor teeth? The boy or girl who has his own living to make will find that he is seriously handicapped even in applying for a position if he has neglected his teeth.

Mothers cannot impress upon their children too early the importance of systematically caring for the teeth. Just as soon as the little toddler is able to hold a toothbrush he should be taught to brush his teeth before breakfast, after each meal, and just before going to his little crib at night. The toothbrush should be carefully chosen. It should not be too stiff nor yet too soft.

The question of what dentifrice to use is most important. There are dentifrices on the market which are dangerous, inasmuch as microscopic examination of them shows that they contain pieces of gritty matter which are absolutely injurious to both the teeth and the gums. The teeth should

Had a Weak Aching Back and a Nasty Sick Headache

Mrs. W. R. Hodge, Fielding, Sask., writes:—"A few lines highly recommending Doan's Kidney Pills. For this last year I have been troubled very much with nasty sick headaches, and a weak aching back which caused me much misery, for I could not work, and had no ambition for anything. My kidneys were very badly out of order and kept me from sleeping at nights.

"I tried many kinds of pills and medicines but it seemed almost in vain. I began to give up in despair of ever being well and strong again when a kind neighbor advised me to try Doan's Kidney Pills, which I did, and am thankful for the relief I obtained from them for now I am never troubled with a sore back or sick headaches. I will always say Doan's Kidney Pills for mine and can highly recommend them to any sufferer."

Price 50c per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

A Windsor Lady,s Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

When you have a bad cold you want the best medicine obtainable so as to cure it with as little delay as possible. Here is a druggist's opinion: "I have sold Chamberlain's Cough Remedy for fifteen years," says Enos Lollar of Saratoga, Ind., "and consider it the best on the market." Sold by all dealers.

Feel Young Forever

Let Me Put Vitality Into Your Blood, Nerves, and Body. Follow Me to Health and Manhood. I Can Show You What Others Have Done to Change Debility, Weakness, and Despondency Into Health, Strength, and Vigor.

Vitality is the measure of the man in this day of big deeds and monster achievement. He who has great vital strength cannot grow old. Years count for nothing if you have the vitality in your blood and nerves. My Health Belt with suspensory attachment is the FOUNTAIN OF PERPETUAL YOUTH. It pours quantities of electro-vital force into your weakened system. It works quietly, mildly, continually hour after hour while you are sleeping. It is your opportunity as it has been the opportunity of tens of thousands before you ; it supplies you with that vitality upon which health and courage depend. It is a power and strength giver of the highest order. No drugs, nothing to take internally, no dieting, no hardships of any kind. Simply use the Health Belt nights until you are restored to vigor. It never ceases until you have as much courage and self-reliance as the biggest, fullest blooded man you know. Your eyes will have the sparkle of full health, you will have the vigor of a strong, healthy man. Henry Eggman, Norwich, Ont., writes : "Thanks to the use of your Health Belt I am young again. It restored me after all else failed. Use my testimonial as you see fit." This is but one of thousands. Get the free books and read of others.

Special rheumatism attachments to my Health Belt carry the Electro-Vitality to any part of the body, the neck, back, arms, legs, feet. It finds and drives away all pains and aches ; it has often completely cured a weak back in one night so that it never returned again. It is a wonder remedy for chronic ailments of the nerves, blood and muscles.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the word. Liberal discount for cash if you prefer to deal that way.

These Books Sent Free

Let me send you these books. They contain much valuable Health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card, or if possible call at office and see Belt. Office hours : 9 to 6 : Saturday until 9 p. m.

$50.00

THE PAQUET COMPANY LIMITED.

QUEBEC, - Canada.

be cleansed with lukewarm water and a good dentifrice. It is well to brush the upper part of the teeth downward and the lower teeth upward. The under surface of the teeth should be carefully brushed from the gum toward the grinding surfaces. The grinding surfaces, of course, should be thoroughly brushed in all directions.

After each meal all particles of food should be carefully removed from between the teeth with either a quill toothpick or with dental floss. Do not use a wooden toothpick. They are dangerous as tiny splinters are apt to lodge between the teeth.

In addition to being painstaking about the daily care of the teeth a semiannual visit to a good dentist is necessary. He should examine the teeth thoroughly and fill all minute cavities. The old saw of a stitch in time saving nine is especially applicable in dentistry. A tiny cavity may be filled with almost no pain or expense. If allowed to run a short time it will easily cost nine times the pain and expenditure.

So closely allied are good health and good teeth that in many public schools dental inspection of the children has become a part of the school system. Blanks with diagrams of the teeth are furnished and the needs of each child are marked and sent to the parents. With these blanks goes an urgent recommendation that the child be taken at once to the family dentist. Where parents cannot afford this the work is usually done by dentists who devote one-half a day a week to the cause.

When dental inspection becomes compulsory in all schools we will certainly have a stronger, healthier race, for good health and thoroughly clean teeth go hand in hand.

The Worth of a Wagon Lies in It's Tires

Wheel and tire troubles are over for the man who equips his farm wagons with T-K Wide-Tire Steel wheels. They will carry 25 to 50 per cent. heavier loads in deep mud or over the rockiest roads without delay or danger of accidents. They make farm work lighter; stand any strain and are proof against breakage.

T K Wide Tire, Steel Wheels and Handy Farm Wagons

This is the sort of wagon you want for doing all kinds of work around the farm. It is handy for loading and unloading, will carry as great a load as any team can haul, and because it never needs repairs it is the most economical wagon on the market.

Tudhope-Knox Co., Limited, Orillia, Ontario

Home Music a Pleasure Asset.

It is an acknowledged fact that the value of music in the home cannot be overestimated. This is especially true in the case of homes scattered far and wide, because it is a means of bringing people together more frequently than they would perhaps meet under ordinary circumstances and everybody knows recreation and sociability are necessary to the happiness and, in fact, health of every man, woman and child. If we are to keep well and happy we must enjoy the society of each other from time to time and nothing adds so much to the pleasure of social festivities as music.

Those who love music will need no other inducement to lend their presence to any gathering where it will be heard, while those not particularly interested in the art can always enjoy the social side of it and be duly appreciative. Therefore music benefits directly and indirectly and certainly everyone is better for it.

Again, music is one of the greatest charms for whiling away dull evenings. Time simply flies under its spell, and when weather conditions prevent any visiting or merrymaking, to be able to turn to music in one of the pleasantest recreations imaginable. Hence it will be seen how necessary it is to make some provision for music in the homes of those people who cannot, because of circumstances, attend concerts, theaters and similar public entertainments, but must depend upon each other for amusement.

Vocal music is always popular, especially with older persons, and when there are a number of young people available it is quite an easy matter to form a quartet of voices and a chorus which under a leadership, could get up similar cantatas, part songs, etc. People who love music are by no means confined to the class living in cities and large towns. There are many living remote who are quite as appreciative.

If the singing could be accompanied by an instrument so much the better, and, if it could be a portable one the value would be increased, because the musicians could visit from house to house together.

The talking machine has undoubtedly done much to lift the monotony from the lives of those living far apart from each other. All that is best in music and dialog can be brought to one's door by the talking machine. All or any of it may be had for the buying, so that all tastes from grand opera to vaudeville may be gratified.

Utilizing Unsalable Apples.

I have experimented with hand mills of various kinds to see what I could recover from cider fruit, and I have been able to take out of apples by ordinary hand mills over one-half of the juice present, and usually less than one-half. Fruit that goes to vinegar factories averages 12 per cent sugar; that is, a bushel represents about six pounds.

Three pounds of sugar to a bushel of apples is a high result with the ordinary hand mills. With an 80-ton hydraulic press, I have been able to recover four gallons of juice from 50 pounds of fruit, double the quantity I could recover with the hand mills, and yet I left in the pulp about 12 per cent of the juice. Practically 25 per cent of the total weight of apples went out in pomace, or from 4 to 8 per cent of the sugar. With the best power mills, under a most efficient working system, it is certain that practically 5 per cent of sugar is thrown out in the pomace.

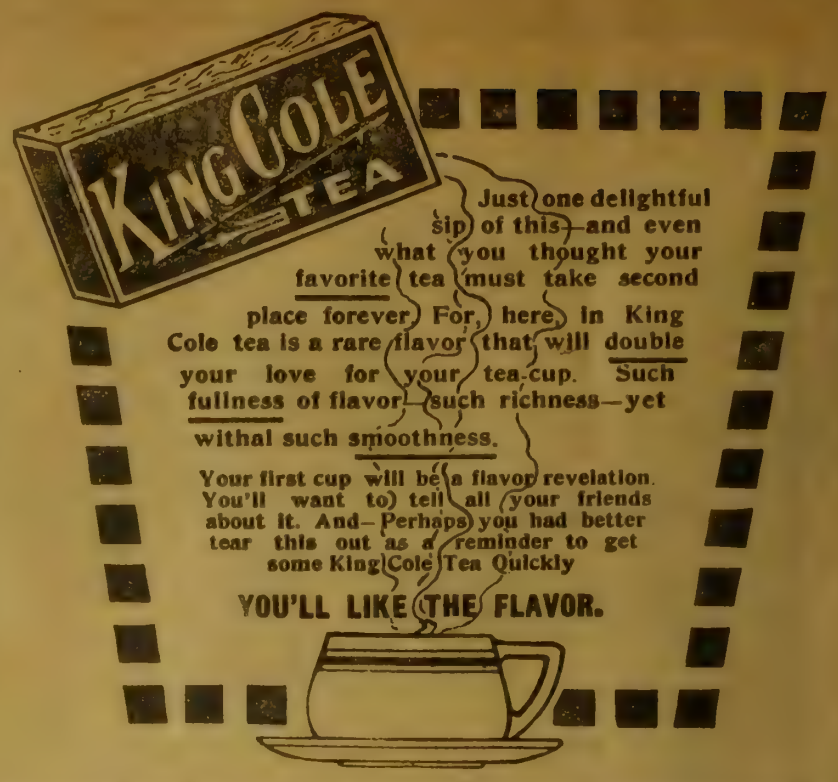
There are something like 5,000,000 bushels of apples worked up every crop year in New York state for by-products. If we assume that 24 per cent of this fruit will be left as pomace, we will have about 60,000,000 pounds of pomace, which will contain 3,000,000 pounds of sugar, or 1500 tons. Data collected for 1909 indicate that this quantity of pomace is produced and that 5 per cent of this pomace is sugar.

In regard to the large amount of sugar that goes out in the pomace as waste, I have never yet seen a manufacturer or a farmer who handled this pomace so as to recover nearly all the sugar left in it. Thousands of tons of pomace are thrown out without the slightest attempt being made to recover the sugar. Some people put it back on the soil, but it ought not to be put on the soil at all until well rotted.

It has been well established that it can be successfully used for cattle food. In France and England it is fed very successfully. Vermont and Massachusetts experiment stations have also experimented with it, and for several years have been feeding it successfully to milch cows.—Prof. W. B. Alwood, U. S. Dept. of Agriculture.

A Word About Recipes.

One day I carried a cake of my own making to a friend I was visiting. Whether out of polite flattery, or because she really liked the cake—it is well not to inquire of oneself too closely concerning the motives of



KING COLE TEA
Just one delightful sip of this—and even what you thought your favorite tea must take second place forever. For, here, in King Cole tea is a rare flavor that will double your love for your tea cup. Such fullness of flavor—such richness—yet withal such smoothness.
Your first cup will be a flavor revelation. You'll want to tell all your friends about it. And—Perhaps you had better tear this out as a reminder to get some King Cole Tea Quickly
YOU'LL LIKE THE FLAVOR.

conservative investors wanted

As a rule our clients get the benefit of all the "Certainties" we control. To-day we are making use of "An Absolute Certainty" for the purpose of extending our clientele. Here's the proposition in a nutshell—

—a 7 per cent profit-sharing preference stock on which dividends are paid twcie a year—a stock issued by a concern with a record of 25 years' successful and progressive business experience---a concern at present controlling Natural Resources which are bound to double the value of its securities before long.

We guarantee 7 per cent. on this investment. We are practically certain that this stock will pay higher profits. Its the best industrial stock, at par, on the market.

Furthermore, we guarantee to buy it back, at par, plus 7 per cent, in one year from date of investment.

Minard's Liniment Co., Limited

The 3 H's--HEALTH, HAPPINESS, HOME

That is what Domestic or Household Science deals with—and its object "THE SECURING OF THE MAXIMUM NOURISHMENT AT THE LOWEST COST AND WITH THE GREATEST EASE OF PREPARATION."

Now this applies not only to food values but to the STOVE on which the food is cooked, and the fact that the---

Enterprise Monarch Steel Range

as shown, is used by so many Domestic Science teachers throughout the Maritime Provinces and Quebec, is good evidence that this range is recognized as the one most suitable for the purpose.

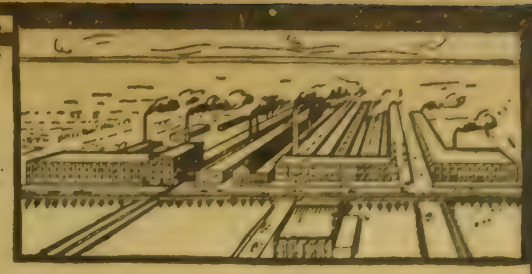
In addition to this it is in use in hundreds of homes and hotels and giving perfect satisfaction.

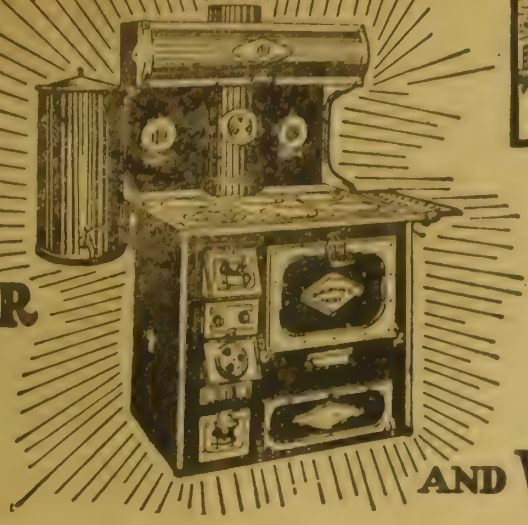
Then too its large fire-box for wood burning makes it the ideal range for farm kitchens.

Sold by Leading Stove Dealers Everywhere. **Descriptive Circular on Request.**

The Enterprise Foundry Co., Manufacturers, Sackville, N. B.

DIRECT FROM FACTORY TO KITCHEN





SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

$41.00 TO $49.00

AND WE PAY THE FREIGHT

You can buy DOMINION PRIDE RANGE at Factory Price

Direct from the Largest Malleable Range Works in Canada

THE price which the Dealer quotes you on a Range is made up like this — Manufacturing Cost + Manufacturer's Profit + Jobber's Expense of Handling and Selling + Jobber's Profit + Retailer's Expense of Handling and Selling + Retailer's Profit + Freight.

By our direct "Factory to Kitchen" selling plan all these charges are cut out except the actual manufacturing cost, a small profit, and freight. The difference to you is the difference between the $41 to $49 which you pay for a "DOMINION PRIDE" Range and the $69 to $78 which you would have to pay the Dealer for a Range which cost as much to make.

Are you anxious to contribute $25 or $30 to the middlemen?

In the—

"DOMINION PRIDE RANGE"

you get a full dollar's worth of actual stove value for every dollar you pay.

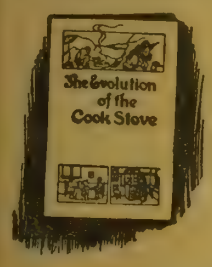
The "DOMINION PRIDE" is made of tough, strong malleable iron and the best blue polished steel—materials that will neither warp, crack nor break, so that it will last a lifetime. It is made in the largest Malleable Iron Range Works in Canada, and each range is backed by our unconditional guarantee.

The "DOMINION PRIDE" looks well, cooks well, saves fuel and is easily cleaned. You'll be proud of its neat, handsome appearance in your kitchen, and of the appetizing food it will cook to perfection for you. You'll appreciate the ease of keeping its blue polished steel surface and the bright polished top spick and span with a few rubs of a cloth. Your husband will be more than pleased with the reduction in the coal or wood bill—for the "DOMINION PRIDE" saves, by actual tests, 30% of the fuel.

A "DOMINION PRIDE" Range, with High Closet Shelf and Elevated Tank or Flush Reservoir, with Zinc Sheet to go under range, 8 sections Blue Polished Steel Pipe and 2 Elbows, will be delivered to any Station in Ontario, Quebec or the Maritime Provinces for $41, or to any Station in the Four Western Provinces for $49—$5 to be sent with order and balance to be paid when Range is delivered at your Station. If not convenient to pay cash we will arrange to accept your note.

Here is a Book Worth Having

IT tells about cooking from the time the Cave Dwellers used to put hot stones in the pot to boil it. The Book contains interesting information gathered from many sources and is illustrated profusely.



The "Evolution of the Cook Stove" also tells all about the "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy this book.

When writing it will be a distinct favor to us if you will mention this paper. 6

one's friends' attentions—she asked me for the recipe. Now it was the ordinary "family brown cake," and I said truthfully that I made it from the fundamental recipe of all cakes, and that I seasoned it according to my own taste, and made it richer or plainer according to the occasion for which it was required. Rather to my surprise she did not catch on the meaning of "fundamental recipe." She seemed to think, although a housewife of long standing, that each cake must have a separate "recipe." I think there are tens of thousands of excellent, practical housewives and cooks who do not think clearly and exactly about their own processes. We all, in practice, work from fundamental principles of cookery, and from a few general recipes.

She insisted upon copying to my dictation into a fat manuscript cookery book, and then read out to me a number of recipes she had begged from other friends, after one or two of which I remarked, "That is practically the same as mine; the differences are merely in detail. How can you find time to test all these recipes even once?" An over-multiplication of recipes is a useless possession. Don't you find it so? The chief end to be sought is to master thoroughly the principles of cooking meat, vegetables, sweet dishes, cakes, &c., and after that we can pretty much make our own recipes.

What Baby Should Weigh.

The baby of normal weight tips the scales down at birth at the 7 lb. mark. If he or she is much heavier or much lighter, he or she is at odds with the average. A peculiar feature of baby weight is that during the first days of its life the youngster—that is, the perfectly normal youngster—loses 1 lb. Thus, examination made on the second and fourth day will show a weight of 6 lb. only. But after the first week, at the end of which time the lost pound should be regained, there is a steady advance. Ten pounds should have been reached by the time the baby is eight weeks old, and when it is twenty weeks old the weight should be 14 lb. At seven months the figure should be 16 lb., and the year old baby should have a mark of 21 lb. to its credit. And so the future citizen or citixens goes on building up, until, at the age of two years, it is able to point with pride to a record of 27 lbs.

Some fertilisers may appear, judged only by the figures, yielded by analysis, to be rich in the fertilising elements required by plants, and yet the available portion of the plant food contained in them is in such a slowly acting form that it is not of any real value to the farmer for immediate effect on his crops. It is true that the insoluble materials in the fertiliser will prove of benefit in the future, after they have remained in the soil sufficiently long for the processes of natural disintegration to convert them into a condition suitable for plant food; but the farmer who buys fertilisers does not expect them to remain dormant for a time in his fields' he wants them to act on the crops during the same season they are applied. Therefore, he should select fertilisers which contain their nitrogen, phosphate, and potash in forms which are more or less quickly available, so that the greatest benefit may be derived from their application.

FLORICULTURE.

I have received some Daffodils, Tulips, Hyacinths, two Lillium Candidums and Easter Lillies, Fuesias and two Lillium Auratims, the latter will come in November. I have planted the Fuesias, the Easter Lillies and two each of Tulips, Daffodills and Hyacinths, in pots, in a mixture of well rotted manure, sand and rich earth and am keeping them in a cool cellar with the earth damp.

Will you please tell how long I should keep them there and what to do to get the most bloom from them this winter? What shall I do with the bulbs after they are done blooming?

The rest of the Tulips, Daffodills, Hyacinths and the two Lillium Candidums I set out of doors about 4 or 5 inches deep. Was that all right and will they need extra protection this winter?

Please tell me what to do about the bulbs next summer. If it will do, I would prefer leaving them undisturbed but do not know if it will affect their blooming the second year or not. I know nothing from experience about flowers from bulbs, so trust you can give me the necessary information as I think they may be less trouble than annuals.

The bulbs are correctly planted and the pots should be left in a dark place until sprouts are two inches high. After being brought to the light, keep moist and in a sunny window. An occasional application of liquid cow manure water will improve size and color of flowers.

The out-of-doors bulbs should be covered with brush or several inches of strawy manure. Let the bulbs alone next summer, simply planting between them.

A light topdressing of well-rotted composted manure is a good thing for lawns at this season of the year. Even green manure will make an improvement in the looks, in the spring but is apt to be offset by the foul weeds thus sown.

H. S. writes:—Are Bermuda Oxalis good for hanging plants? Yes they make beauties for winter bloom and produce a marvellous quantity of bright yellow blossoms, nearly twice as large as the old-fashioned Oxalis. It has the advantage of being a very rapid grower and blooms steady from November until April. The foliage is large for the Oxalis family, and very glossy and ornamental.

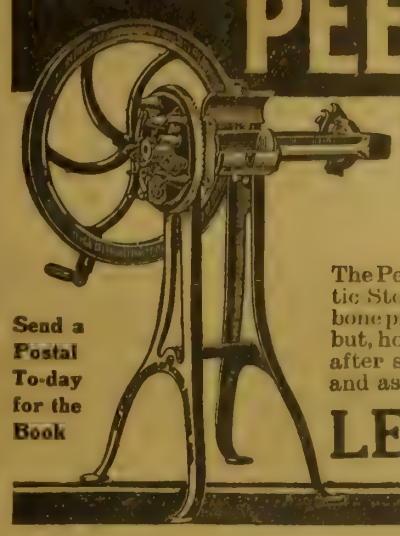
Fertilizers For Potatoes.

Does it pay to use fertilizers for potatoes, and if so, how much and what analysis? The above questions are frequently asked, and the answer is more easily given by learning what is used in the great potato growing districts.

On Long Island there is a co-operative association of farmers who buy about 6,000 tons of fertilizer, and analysis they demand is 5-8-8; the fact that they grow very largely early potatoes accounts for the high per cent. of nitrogen in this mixture. This is also true of the truckers of the Norfolk district, who grow potatoes for the early New York market, and who use as a standard a 7-7-7—seven of nitrogen, seven of phosphoric acid, and seven of potash.

The Ohio Experiment Station in some recent fertilizer experiments obtained the largest yield from an application of 160 pounds of acid phosphate, 100 pounds muriate of potash and 80 pounds of nitrate of soda. This material would be equal to about 340 pounds of a 4n.-6½p.-15k. goods, which is about the same analysis as Mr. T. E. Martin, West Rush, used, 1,800 pounds to the acre, to produce his yield of an average of 418 bushels on 18 acres—a yield which has probably never been equalled.

PEERLESS GREEN BONE CUTTER



Send a Postal To-day for the Book

For half the cost of wheat, you can feed your flock succulent green bone—the most perfect egg-producing food known. A pound of green bone, costing but a single cent, will feed 16 hens for a day. Per hen, that is only

1/16c. PER DAY

The Peerless Positive Feed and Automatic Stop Green Bone Cutter cuts green bone properly; it does not grind the bone but, holding it endwise, cuts off shaving after shaving—as bone should be cut, and as it is most easily digested and assimilated. Write for our book—sent FREE telling all about how to feed green bone to your flock, about its economy, its muscle-forming values and its wonderful egg producing properties. A postal will bring it to you. 101

THE PUZZLE.

GEPNINIW ORTONOT
NOTRAELM XFAILAH

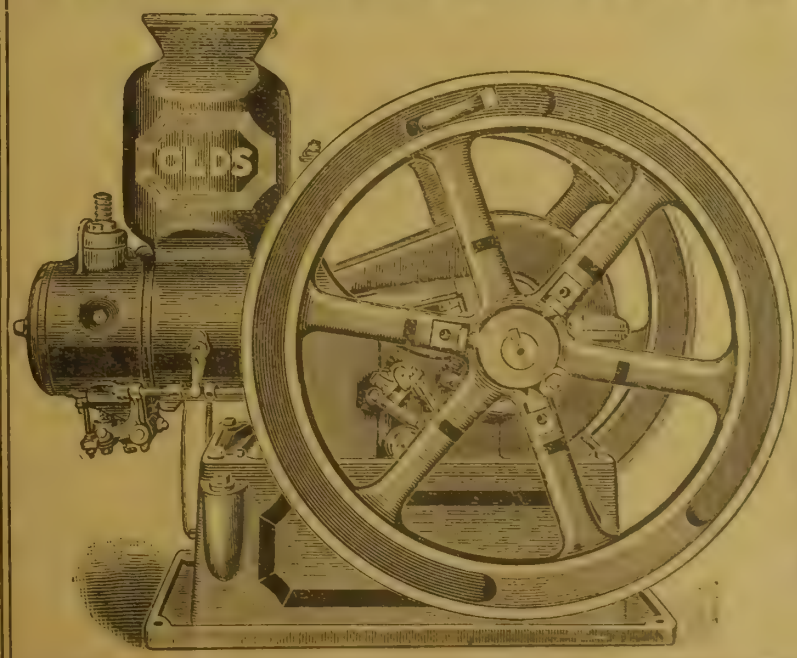
The jumbled letters given above represent the names of 4 well-known Canadian Cities. To help you solve them we have underlined the first letter in each name.

The first is Winnipeg, now guess the rest and send us in your solution of all four names in your very neatest and best handwriting.

CONDITIONS:
1. This contest is absolutely free. No one is asked to spend a cent to enter.
2. Children under 12 years of age will not be permitted to enter.
3. No employee of ours or relation of employee will be allowed to compete.
4. The prizes in the contest are awarded according to handwriting and general neatness. Be neat and you may win a good prize.
5. Judging will be done by three gentlemen having absolutely no connection with this firm. Their decision is to be accepted as final.
6. There is a simple condition to be fulfilled which we ask of all contestants. As soon as your answer is received we will write advising you if it is correct and telling you of this condition.

Address INTERNATIONAL MANUFACTURING COMPANY, Dept. 90 TORONTO, ONT.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Special Value of Green Food.

A contributor writing in "American Farm Poultry," says:—In the first place I had all my houses put into good winter condition in September, before autumn rains came; all old litter removed; fresh sand put in; broken glass set; and every crack about the roosts closed, in readiness for cold weather, let it come early or late. By October all the fowls were in permanent winter quarters, although the houses were not closed until the nights were quite cool.

For morning meal all winter I gave mixed grains—two parts, by measure, of oats and corn, and one of wheat, occasionally one part of barley, in all about one half handful for each fowl, fed in 6 in. of litter. At noon a few handfuls of unthreshed oats were thrown in each pen for them to pick out. At night all the mash they could eat clean in ten minutes was given them, followed by half-a-dozen handfuls of mixed grain, for each pen in litter. On very cold nights whole corn was substituted for the other grains. The mash was composed of two parts, by measure, of bran, ground oats, and corn meal, and one each of middlings and meat, and one-half measure of linseed meal, with one-third of the entire mixture steamed cut clover. All food was fed warm, the grain set in stove oven for two hours before feeding.

Shells and grit were always before them, and warm water furnished fresh three times a day. Until into February a cabbage was hung up in each pen all the time, and after these were gone for the season, other green meat. I have found this green food of great importance in a good egg yield. In the winter of '97 and '98, my fowls had plenty of it, and from 66 pullets I obtained more eggs than from 50 hens and 110 pullets the following winter when they had some food without the cabbage. Last winter 110 hens and 25 pullets gave me twelve per cent. more eggs than 50 hens and 110 pullets did the previous winter; which, allowing for number and the difference in eggs yield between hens and pullets would make at least twenty-five per cent. increase from green food.

Vomiting in Cattle.

This is a symptom of an overloaded stomach, one that is not in normal condition, consequently is unable to care for and digest the feed that is taken into it.

The result of this weakened condition of the digestive organ is indicated by the expulsion of the semi-liquid contents passing out through the nostrils, as well as large quantities of chewed up feed being expelled through the mouth.

The moment a milch cow is afflicted in this manner she is very apt to drop off on the regular flow of milk, not owing entirely to the fact that the cow is distressed, but rather to the fact that the food is not being digested, consequently not being converted and assimilated and transformed into blood, and later secreted in the form of milk.

When a cow is thus afflicted it is very important not to give it any more feed until she is given such medicines as will have a tendency to stimulate the digestive organs, thereby aiding digestion and assimilation of the food that has already been taken in.

As soon as this is brought about the animal of its own accord will show a desire for food and if the feed is held back until this desire is indicated, it is then time to give it a reasonable quantity of feed, but if the animal be given an abnormal quantity or an over supply, the same trouble will again return, namely, indigestion, irritation and expulsion of the food, as above described.

Rabies in Cattle.

Rabies is a germ disease, usually attacking dogs, but all warm blooded animals, including man, are susceptible to the malady, which is always communicated through bites from a preceding case.

The disease first manifests itself in cattle by a loss of appetite, a rumination and stopping of the secretion of milk, great restlessness, anxiety, manifestation of fear, in fact the entire disposition of the animal is changed.

This stage is followed in a day or two by the stage of excitement and madness which is indicated by increased restlessness, bellowing in a peculiar manner, owing to the partial paralysis of the throat, violent bunting, pawing the ground, and a great tendency to attack other animals, although the desire is not so marked in cattle as in other animals.

A constant symptom is the increased secretion of saliva or froth at the mouth. Constipation is usually present, owing to a partial paralysis of the bowels and there is a continual desire to defecate, but the animal is usually unable owing to the paralysis mentioned.

If an animal is permitted to live, about the fourth day it becomes more quiet. They get stiff, unsteady and a swaying gait, owing to the general partial paralysis of the body. The loss of flesh is extremely noticeable owing to the fact that the animal does not eat or drink to speak of. This is due to an inability to swallow. If the disease is permitted to run its course, the animal usually dies from the fourth to the sixth day and as there is no treatment which can successfully control this disease. it is advisable to destroy the animal in the early stages ol the disease, but it is exceedingly important to be positive that it is rabies as some of these symptoms may appear in other ailments, such as lead poisoning.

Eye Disease.

Sore eyes may be due to various causes such as injury or catarrhal infection, and when due to the latter the entire herd is apt to become affected.

It is advisable to keep animals thus affected in a dark stable during the day, allowing them to pasture at night.

The eyes should be bathed several times daily in an antiseptic solution, after which time an eye lotion should br injected into the eye. Give animals access to medicated salt.

A Winter Fair Prize List Correction.

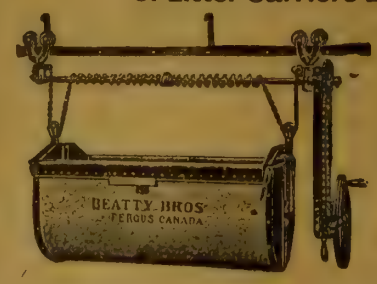
Mr. F. L. Fuller, manager of the Maritime Winter Fair, wishes to correct a mistake that inadvertedly crept into the 1911 prize list. Class 135, page 35 should read "Donated by the Maritime Poultry Supply Co., J. Vernon Jackson, manager, Moncton, N. B. For the best Cock, Hen, Cockerel and Pullet in the Barred Plymouth Classes—1st, 1 bag Purity Chick Food; 2nd, 1 bag of Esso Chicken Charcoal."

Valley's Record Apple Crop.

It is now generally conceded that the apple crop in the Valley will this year reach, if not exceed, 1,500,000 barrels. The problem at present is the barrel question. Barrels are hard to get at 40 cents each, and even then the farmer must content himself with a very few at a time. Many are picking and storing apples in bins until barrels can be had, in some cases, having to wait several weeks. Such a crop has never before been known in the history of apple growing in the Annapolis Valley.

It Will Pay You to Investigate

Carefully the Merits of Different Makes of Litter Carriers Before Buying an Outfit



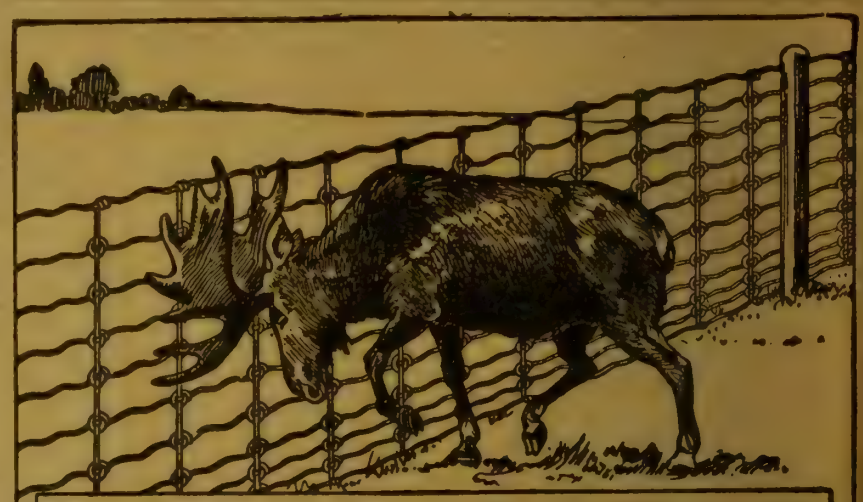
DON'T be satisfied with any style of litter carrier that is offered to you. If possible see different makes in operation and compare them. Should you be unable to do this, we will be pleased to send you our new catalogue, which describes and illustrates the BT. Litter Carrier. by reading this carefully you will get complete information and we know you will be pleased with our outfit.

The BT. LITTER CARRIER will stand your most careful inspection. It is simple in construction and is built to last a lifetime. We use double-purchase in lifting and have a straight sprocket-chain connection for lifting, with which it is possible to attain an efficiency of from 70 p. c. to 80 p. c. Most firms use a worm gear lift, and with them from 50 p. c. to 60 p. c. of the energy of the operator is lost in friction. Is it any wonder that the BT. Litter Carrier elevates easier and quicker than others ?

Send us a sketch showing the layout of your stables, with measurements thereon and let us know where you want the litter carrier to run. We will then be pleased to give you an estimate as to the cost of installing and send complete information.

Now is the time when a litter carrier is most useful and you should get information and prices at once. Our Catalogue is free and will be mailed to anyone interested on request. Write us to-day.

BEATTY BROS., Fergus, Canada. We also manufacture Steel Stalls, Stanchions, and Hay Tools.



This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough — that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

NEW BRUNSWICK WIRE FENCE CO., Ltd., Moncton, N.B.

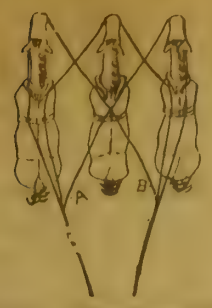
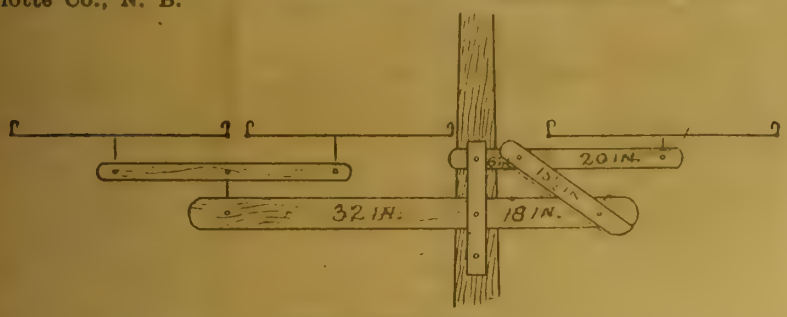
Three Horse Evener.

Editor Maritime Farmer:—
Will you please inform me through the columns of the Maritime Farmer how a Three Horse Evener can be made to be used on a wagon with a pole, with two horses on one side and one on the other so as to give an equal draught to each horse, also please explain how it could be arranged to give one horse (a smaller one, for instance) an advantage on either, or both sides.—W. S. Poole, Charlotte Co., N. B.



Running a Three-Horse Hitch



A Three-Horse Evener

The accompanying cut shows a three horse evener that is very commonly used. You can arrange to to give a smaller or weaker horse an equal advantage with a larger or stronger horse by hanging your double-tree so that the smaller horse will have the longer end thus giving him more leverage and consequently more power.

Prize Essays on Agricultural Subjects.

Editor Maritime Farmer:—
It gives me a great deal of pleasure to commend the management of the Port Elgin, New Brunswick Exhibition in awarding prizes for the best essays on agricultural subjects entered for competition at their fall Exhibition. These essays are forwarded to me at Truro, and I have just completed reading and awarding prizes upon them. This feature of the Exhibition Prize List was, I believe, inaugurated last year. At any rate, I examined a similar series of papers a year ago. I am pleased to notice that, this year, there are not only more competitors, but the quality of the essays written is quite superior. I will be very much surprised if tangible results do not follow this effort to interest the younger people of New Brunswick in writing essays upon suggestive agricultural topics.

In this year's competition, there were three separate sections, prizes being awarded for the best essay in section 1.—"How to keep the boy's on the farm." Section 2—"Agriculture as a profession; How best to prepare for it." Section 3—"A kitchen garden on every farm; What to grow in it and how to cultivate it."

It was my only regret, in examining these essays, that I had only nine prizes to award and could not award merited prizes to the number of extra essays over and above those provided for.

I thoroughly believe that it would pay other Exhibition Commissions to follow the example of the managment at Port Elgin and adopt this commendatory feature. Those who are interested in doing all they can to awaken the interests, especially of the young people, in matters agriculturally, would do well to correspond in regard to this competition with Mr. J. R. Taylor, Secretary Port Elgin Exhibition, Little Shemogue, Westmorland Co., N. B.—M. Cumming, Truro N. S.

The New Brunswick Potato Crop.

Mr. F. De L. Clements, estimates that this year's marketable potato crop in New Brunswick amounts to 700,000 barrels two-thirds of which is now out of the farmers' hands at averaging $1.50 per barrel F. O. B. car. About 250,000 barrels have been marketed in the Provinces of Ontario and Quebec, while 50,000 barrels have been shipped South.

I. C. R. Booklets as I. O. O. F. Souvenirs.

At the recent session of the Sovereign Grand Lodge of I. O. O. F., heid at Indianapolis, Indiana, and attended by delegates representing practically every Grand Lodge of Odd Fellows in Canada and the United States, the representatives fron the Maritime Provinces used as a Souvenir gift to other, visiting delegates, a set of the publications of the Intercolonial Railway.

The publications selected for distribution were the principal I. C. R. descriptive book, "Forest, Stream and Seashore," and the three booklets, "Storied Halifax," "The City of the Loyalists," and "The Garden of the Gulf." The first of these was enclosed in a specially prepared envelope, showing by whom presented, and bearing the names of the Maritime Province delegates. The three smaller booklets were encased in a smaller envelope similarly inscribed.

As a Souvenir this proved to be a happy departure from the usual method of exchanging badges, buttons, etc., and proved most acceptable, especially to the delegates from the far West, and from the Southern States. The Maritime Province men were warmly congratulated upon the success of their plan to thus place a lot of valuable descriptive matter concerning their country before such a gathering and give the same such wide distribution, for it means the books will be in the hands of a prominent member of this important fraternal organization in every state of the Union and from every Province in Canada.

Boston Markets.

The Boston Jobbers' price for Canadian hay ranges from $19 to $26 per ton, according to the grade, while the best price quoted at St. John is $10.50 to $11. Eggs show a differenc of fifteen cents a dozen.

On the other hand, the difference in the price of flour is in the other direction, a reduction being noted in the Boston markets.

The following is a comparative list of prices on staple products:

Oats, western—Boston, 55 to 55½ per bus.; St. John, 51 to 53 per. bus.

Potatoes—Boston, $1.75 to $1.85 per two bu. bag; St. John, $1.50 to $1.75 per bbl.

Butter, dairy—Boston, 27c to 28c. per lb.; St. John, 23c. to 24c. per lb.

Butter, creamery—Boston, 32½c. to 33½c. per lb.; St. John, 24c. to 27c. per lb.

Eggs, hennery—Boston, 44c. to 46c. per doz.; St. John, 28C. to 30c. per doz.

Eggs, case—Boston, 33c. to 35c. per doz.; St. John, 23c. to 24c. per doz.

Squash—Boston, 60c. to 75c. per bbl.; St. John, 1c. to 1½c. per lb.

Flour—Boston, $4.30 to $5.50 per bbl St. John, $5.50 to $6.45 per bbl.

Steel Oven
Heats Quicker—Saves Fuel

Pandora has a sheet steel oven, because steel is more sensitive to heat—absorbs it faster—than cast iron does. Pandora oven thus heats quicker—less time required to get oven ready for the baking—which also means less fuel-expense. ∴ ∴ ∴ ||

Make sure your new range has a steel oven, and "Pandora" name-plate on the door. Go, at once, to nearest McClary Agency and pick out size desired.

The Manure Spreader.

A most valuable implement that a farmer should get hold of as soon as he can afford it is a manure spreader. The advantages of a good supply of stock on a farm are thereby much increased, for not only does its presence impel one to utilise every particle of plant food available, but it puts the manure to the best advantage without any delay.

Spreading manure with a fork loses on the average half its value. In the first place it is not well and evenly spread, an important matter. Then the clods remain unbroken, and their contents remain unused for perhaps a season or two, during which a great deal of it is wasted. (The total amount of plant food utterly wasted is colossal.)

The use of a manure spreader will very soon justify its purchase. It breaks up every clod, and distributes the manure evenly on the soil, thinly or heavily as may be wished. This latter point is very advantageous. Few farmers have enough manure for all their land, and a dozen loads spread over two acres are far more effective than the same quantity devoted to one. This is because the material not only gives plant food but fresh life to the land. The effect of the manure spreader is felt all over the entire area the first year, for it enables the plant food to get to work at once, and plant life thrives.

The cost af the spreader is substantial, but an investment so certain of returning its own cost and a great deal more should not frighten any farmer with a business head and the money at command. Only farmers without the latter qualification should hesitate to purchase so eminent a drudgery-saver.

Knowing the Cost.

The practical results which are being obtained from the work of the cow-testing associations are to be found in many cases in the difference between profit and loss in the product of the cows of a dairy or farm herd, and these results simply show in a definite sort of way the benefits to be derived from knowing just what one is doing in the way of making a profit out of his business, and knowing just what the operation of his business is costing him.

One of the most difficult things to do in the direction of encouraging the adoption of more systematical business methods is to convince men that there is actual value in dollars and cents in knowing just exactly what is the cost and the profit of a particular feature of their business. This value does not lie of course simply in knowing how much profit was made on the cows of the dairy, or upon some other product of the farm; it is to be found practically in the knowledge of just what enters into the making of the cost, the cost, for instance, of the week's or the month's product of milk from a certain cow.

That knowledge will demonstrate one of two things, and in that demonstration will point the way for the future—the way to a larger profit or the way to the elimination of a loss. If there is a loss, the knowledge of the cost will point the way either to an improvement by a change in feeding, or to the necessity of getting rid of the cow.

Some cows, sad to relate, cannot be made to pay a profit. Some cows which cannot make a profit in the production of cream or butter might make a profit in the sale of milk, if it would get by the fat test as required by law. Some cows which could not be made to pay a profit if one were selling whole milk might be profitable for butter making in skillful hands, but it is very likely that any cow which could not make a profit in either of these directions would better be made into beef.

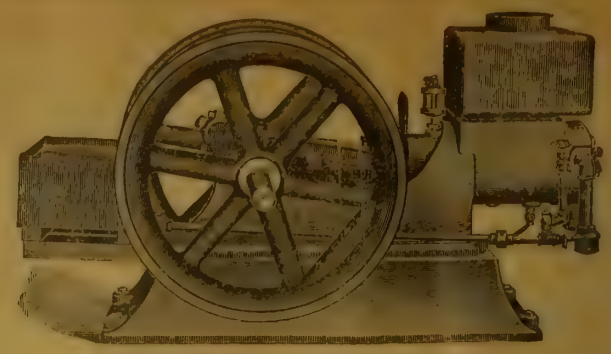
It was not so very long ago that dairy cows were bought and sold largely on their looks, and it was only on occasions that a cow was judged by the amount or quality of her milk product. The practice of keeping records of the production of individual cows, together with a record of the cost of their feed and making a comparison of this cost with the total income for the purpose of learning the ultimate profit, has placed the dairy business of those who have taken up this practice on a sound business basis.

Some dairymen have learned some surprising facts by the practical operation of this system, which is a foundation principle of the cow-testing association. I have heard men declare that the figures of the official tester of the cow-testing association have shown them that they were making milk, or cream, or butter, as the case may be, at a loss, and this because of the abnormal cost; that by following the suggestions of the tester they were able in a short time to reduce the cost to the level of the income, and that a little later they were able to make a profit. I have heard men explain that the figures showed them that a cow which they thought was the best in the herd was one of the poorest, and ought not to be retained; also that cows which they thought were only ordinary were among the best and worthy of extra care and encouragement.

The cow-testing association is the opportunity of the dairy stock beeeders for the greatest improvement in dairy animals that has ever been made.

Determining Age.

The calf is usually born with two fore or cutting teeth, and in one month the entire eight are out. The age then is estimated by the wearing down of these teeth until the calf is eight months old, when the teeth begin to grow narrower and smaller. At eight months the two center teeth have become smaller than the rest, and from that time until eighteen months old the others gradually lessen in size and stand apart from each other. At two years old the two middle teeth are pushed out and succeeded by two permanent ones; at three years of age there are four permanent teeth; at four years of age there are six; and all the rest at five years of age, when the animal is said



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

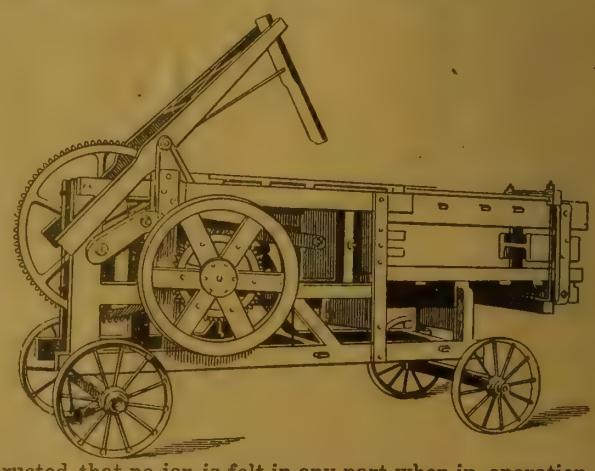
Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

J. D. FRIER, Sussex, N. B., Eastern Representative.

Improved Trenholm Gear Hay press

Operated With Gasoline Engine or Tread Power.
The More Power The More Work.



Note the strong, heavy frame built of the best quality of well seasoned hardwood. The heavy balance wheel weighing over 500 lbs. The heavy cog wheel weighing over 500 lbs. The side springs made of the best quality of spring steel. The bale box is steel lined and the whole machine so powerfully constructed that no jar is felt in any part when in operation.

This is now the season for Wood Cutters, we manufacture them in three different sizes; Long Swing, Short Swing and Flat Roller Table.

In Farmer's Feed Boilers we make the Star with steel frame and cast culdron in three sizes and the All Cast in two sizes.

We can fill your orders at quick notice. Get our catalogue and prices at once.

THE SUSSEX MANUFACTURING CO. LTD., SUSSEX, N. B.

to be "full mouthed," but really this is not correct; the animal is not so until six years of age, when all of the eight teeth are level.

A good judge of cows will usually -udge the correct age after that. From six to nine years one can be guided by the wearing down of the teeth, and after that by the diminution in their bulk, as in the milk teeth. At nine the two middle fore teeth are smaller and narrower than the rest; at ten, the next two are so, and so on until twelve years of age, when, as in the animal of two years old, the teeth again begin to stand apart from each other.

The surface of the horn continues nearly smooth until the expiration of of the second year, when a wrinkle or circle of thicker horn begins to be formed around the base. This is fully completed in twelve months and another ring begins to appear, so that if the perfect rings or circles are counted, and two added to them, the age of the cow is supposed to be known. These rings are not, however, clear and entirely distinct and it is very easy to remove one or two of them with a rasp and deceive, at least to an unpractised eye, when a cow begins to be unmarkedly old.

In addition to this, it is a well-known fact that if a heifer takes the bull at two years old the first ring is found at twelve months before its usual time, and consequently, she would always appear to be, reckoning by her horns, twelve months older than she really is. After all, the age, as shown by the horn, can only be calculated in the cow. These "rings" do not appear in the ox or bull until the animal is five years old and then they are usually too mixed or confused to be counted with any degree of accuracy.

Cows Before Freshening.

Having had several disastrous experiences with fat cows at freshening time we are decidedly averse to feeding a fattening ration. Cows on pasture may become in good flesh and come to no harm, as the laxative and cooling nature of the green feed and the perfectly natural conditions under which she freshens will keep her in good health, but with the cow confined in the stable eating dry hay and getting little or no erercise it is a different matter. One cow that we purchased only a week or two before freshening was fat enough for beef. She had not been out of the barn all winter until moved here. This was in March. She had no heavy feed after we got her, but within 24 hours after freshening was down with apoplexy in its worst form and died, as we could get no help that understood the disease.

A year or two later our best cow went dry quite a length of time, and wishing her to be in as good condition as possible for the coming season we fed her pretty liberally and she took on considerable fat. Her food constipated her somewhat, otherwise she seemed well. She was down and unconscious before we could get a veterinary to her and I would not have given 2 cents for her. However we got a good man and he brought her out of it, but it cost me $5, some loss of milk and the cow lost her flesh. One other case at a neighbor's resisted all treatment, although she had the best. This cow was very fat and was apparently struck with death when it was found that she was sick.

We feed our cows two quarts coarse bran night and morning while dry. They get all the hay they care for and we turn them into the yard for a time every pleasant day. If there is constipation we feed potatoes or other vegetables enough to correct it. We like to have our cows make a big bag before coming in and never milk them except in extreme cases, believing it better not to. Do not milk the cow dry for the first few milkings, but let the 'calf suck her dry. This is a great preventive of apoplexy. If the bag is caked, bathe it in saltpeter water and rub well with the hand. A dose or two of aconite tincture, 20 drops to a dose, 12 hours apart, will allay all fever.

It is not flesh that the cow wants, but strength and vigor. This is not obtained from fat-forming foods but from bran, oats and good hay with clover in it. Fat weakens the power of resistance of the whole system. The heart and lungs are oppressed and the circulation impeded. Fat people are more subject to apoplexy than thin people. A thin cow is seldom attacked by this trouble; however, we do not wish our cows to be thin, but in good thrifty order. Concentrated foods like corn meal and cottonseed should be introduced gradually after freshening, and if feeding more than two quarts of each to a feed they should not receive the full ration under two weeks.

It has seemed to me that March is the worst month for freshening cows to go wrong. There are other evils besides apoplexy that are made worse if the cow is fat. Failure to deliver, failure to clean and blood poisoning are common. Many good cows die every year from these troubles. It pays to know where to find a good veterinary at short notice and it pays better to reduce the number of cases as much as possible by careful attention to the animal while she is dry and at time of labor and for some time afterward.

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

A Prize Contest open to the farmers of Canada

$3,600 in Cash Prizes for Farmers

READ the conditions of the Prize Contest we are conducting for the farmers of Canada. $400.00 in prizes will be awarded to each Province. These prizes will be divided into four groups, consisting of:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work (shown by photograph sent in) was done.

Every farmer in Canada is eligible. Therefore, do not be deterred from entering by any feeling that you would have little chance against your neighbor. For remember, Prizes "C" and "D" have no bearing whatever upon the quantity of cement used.

As a matter of fact, your success in this contest will depend to a great extent on your careful reading of our 160-page book, "What the Farmer Can Do With Concrete." In this book—sent free on request to any farmer, full instructions are given as to the uses of concrete, and plans for every kind of farm buildings and farm utility. You'll see the need of this book, whether you are going to try for a prize or not. If you have not got your copy yet, write for it to-night. Simply cut off the attached coupon—or a postcard will do—sign your name and address thereto and mail it to-night.

Please send Circular and Book.

Do You Shave Yourself?

If so, you no doubt have shaving troubles, as there isn't one man in fifty who knows how to strop his razor correctly, the almost invariable result is a rounded edge instead of a keen, sharp edge so necessary to a clean satisfactory shave.

MAIL ORDERS FILLED

BRANDT'S AUTOMATIC RAZOR STROPPER

"Makes every man an Expert." Does what no human hand can do.

It automatically sharpens the ordinary old style razor any size or make, and all kinds of safety razor blades including the Gillette, Ever-Ready, Durham-Duplex, Keen-Kutter, Enders, etc. It sharpens them better than the most expert barber can do it. In using the Brandt Automatic Stropper, you do not hold the razor while stropping. You cannot round your edge or cut your strop. The Brandt Automatic Stropper strops the razor for you. It requires no skill or experience. We invite any man who shaves himself to call at our store, and examine this celebrated stropper, and see how it does away with all stropping troubles

SOLD AND ADVERTISED EVERYWHERE AT 3.50 **OUR PRICE $2.50 EACH**

Canadian Specialty Company,

P. O. Box 228 154 Prince William Street, SAINT JOHN, N. B

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Champions of Canada. Champion of World.

In show ring we are champions of Canada. We have defeated the very choicest selections made in United States. We will be shipping a car of Jerseys to the Maritime Provinces early in May. Write at once.

B. H. BULL & SON, - Brampton, ONT.

BELLEVUE STOCK FARM.

Bellevue won male and female championships and all the herd prizes in Shorthorns at the 1910 fairs The championship for Ayrshire bull has been held by us for three years with our Morton Main's Garthrope, an Osborne bred bull. All our prize winners, with the exception of our herd bulls were bred by ourselves. Write for prices or call and see us. We breed our winners and sell them too.

C. A. ARCHIBALD, Proprietor, - TRURO, N. S

SPECIAL POULTRY SALE.

Columbian Wyandotte cock, 2nd prize at Fredericton, $3.00; Columbian Wyandotte hen, 1st Amherst, 3rd at Fredericton, $2.50; Columbian Wyandotte cockerel, 1st at Halifax, $1.50; Barred P. Rock Cock from McDonald college, $1.50; White P. Rock cock, grand utility bird $1.50; S. C. White Leghorn Cock, 2nd ckl. at St. John 1900, $2.00; S.C. White Leghorn hen, 2nd pullet at St. John 1910. Buff Orpington hen, Clark's strain, $1.50. Also one Pure Bred Yorkshire Sow pig, 8 weeks, $3.00. ORCHARD HILL FARM, Brown's Flats, N. B.

Stallion for Sale or Trade.

QUAY JUNIOR, French Coach Stallion, a first class siring son of Quay is offered for sale for $500. or will trade for a first class "roadster automobile." This stallion is 8 years old, weighs 1200 lbs., is pronounced sound by veterinarian, is guaranteed fearless, kind and gentle in all harness, will do any kind of farm work and is a good driver. Particulars by letter.

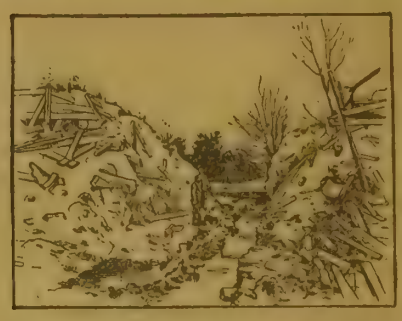
PEDLAR Nestable Corrugated Galvanized CULVERT

Is The Strongest, Most Practical, Durable and Easiest Laid Culvert Made

YOU ought to show this advertisement to your township reeve or warden. Get him to write for the free book about Pedlar Culverts, or write for it yourself and tell him about this new Culvert—the quickest, most economical, strongest for any use any culvert can serve.

See How It Saves Farmers' Money, Betters Roads, Lowers Taxes



This picture is from a photo of a wash-out fourteen feet deep in the Township of Darlington, caused by use of cement tile for drainage purposes. The township authorities have replaced that with Pedlar Perfect Culvert, forty feet in length by three feet in diameter; strongest, easiest laid and most durable they could get.

This picture of the Pedlar Perfect Culvert assembled and ready to lower into place, shows the immense strength and rigidity of these Culverts. Though forty feet long with a bearing of only a few feet at the centre it does not give one-sixteenth of an inch. See how easily Pedlar Culvert can be lowered into place. No skill needed.

Here you see the Pedlar Culvert doing its work of drainage twenty-five minutes after being put in place. It would have taken three times as long and cost three times as much to have installed any other type of culvert. Yet this Pedlar Culvert will last far longer and give no further trouble of any kind.

This view shows the Pedlar Culvert after the fill-in was completed. The Culvert has to carry a dead weight of several hundred tons of earth, as well as tbe live weight of traffic passing overhead. But that can't strain Pedlar Culvert, which will neither give nor spring. It stands what no other culvert can.

Write For My FREE Book No. 60 and Sample

And get a correct idea of what makes a good Culvert. Learn how Pedlar Culvert can be used on your farm.

The Universal Favorite

Is a High-class Family Steel Range, honorably built of the best material, and put together as tight as a steam boiler, and is guaranteed to cook and bake perfectly.

NOTE:—The spacious fire box for wood.
The large fire box opening, 7½x8½ inches.
The roomy square oven.
The top-hinged key plate.
Also note how easily the coal grates can be removed.
The linings can be changed from coal to wood, or vice versa, without the disturbing of a bolt.

There are thousands of Universal Favorites in the homes of our farmers, making cooking and baking a pleasure and the kitchen work easy and light.

THE UNIVERSAL FAVORITE is specially built to meet the requirements of farm homes. The top is large and roomy with six pot holes, the oven will bake sixteen loaves of bread in pans 4 1-2x10 inches at one time. The fire box for wood is 29 inches long, and will burn coarse wood of any kind

NO RISK IS TAKEN, as an unqualified guarantee goes with every UNIVERSAL FAVORITE that it will cook and bake perfectly.

The Universal Favorite is procurable from a dealer in your market town. Manufactured by,—

FINDLAY BROS., CO. Ltd., Carleton Place, Ontario.

Cream Gathering System vs. Whole Milk.

Summer and Winter Dairying

By W. M. Lea, Victoria, P. E. I.

AS a patron of a Creamery both Summer and Winter for the past eighteen years, who has thoroughly tried both systems, I thought I would give our experience in this Province with both the Whole Milk and Cream Gathering Systems.

Just why the much abused Cream Gathering System is always so bitterly opposed is hard for me to understand, as it is inestimately superior to the old system from every standpoint, and the only excuse that can be offered for its retention, in some quarters is, that the people cannot realize how very much better it is in every way and the foolish prejudices raised against the hand separator by some Dairy Authorities who denounce it for its abuses instead of trying to correct them.

Now, Creameries do not need anything for the manufacture of butter but cream and good rich cream at that, so it is not any more reasonable to haul 100 lbs. of milk for miles to and from a factory for the sake of leaving 10 lbs. of cream than it would be for a man to haul his grain to the elevator in the sheaf to have it threshed and haul the straw and chaff back again. Only in the latter case he would not have the by-product destroyed for feeding as is often the case with skim milk.

Milk is never in as good condition to separate as just after it comes from the cow and anything that may have gotten into it is removed before it can cause much contamination. We have very much less of it to get cooled off and take care of, and most important of all, the calf gets the full benefit of its dam's milk. Now, I do not profess to be a scientist, and I cannot say whether it is the milk sugar dissolving, evaporating or turning to acid as other learned men can. All I go by is my own experience in calf raising, but there is a wonderful difference in the feeding qualities of skim milk right from the separator, and that turned from the Creamery, and while we follow the latter practice we continually lose calves or have them ruined in the early months of their existence through this foul milk.

Butter in the Nineties sold low, around 16 to 20 cents, and the cost of manufacturing and hauling under the old system, being about 5 1-2 cents, the excessive cost strangled the industry financially, while the stale milk stunted the future cows.

As winter butter invariably sold higher and for the reason that it divided our work better in the year, we gradually turned to winter dairying. We could then deliver our milk and save considerable in this way, but what of the result.

The Creameries operated only twice a week and instead of separating the milk when warm from the cow, where it was handy to be fed, we stored it in a fairly warm room or carried it around from one building to another as the temperature changed, until we had a load often more or less frozen when we broke the roads to the Creamery. There we bought fuel to again warm it up to separating heat, afterwards

BLIZZARD.

Champion Holstein Cow at the 1911 Halifax, Chatham and Fredericton Exhibitions. Bred in Ontario. Owned and exhibited by Harding Bros. Wish-ton-wish Farm, Welsford, N. B.

A QUARTETTE OF HEAVY DRAUGHTERS—A PROFITABLE CLASS OF HORSES FOR THE FARM.

The above cut shows a heavy draught mare and three of her progeny, first in their class at the 1911 Halifax Exhibition. Each and every one of the animals shown in the photo won first prize in their respective classes. Another colt, equally as good as any of the above, out of the dam in the photo and by the same sire as the colts herewith depicted was a first prize winner in his class, but was inadvertedly left out of the photo. The mare is by the Clydesdale Stallion, Merry Monarch, while her off-spring are by the Clydesdale Stallion, Baron Frederic. Bred, owned and exhibited by Messrs Sharp & MacNeil, Windsor Forks, N. S.

we hauled the skim milk home, put it away to keep cool, then before it was fed, carried it into the house and used more fuel to again warm it up, by which time it usually curdled and was a most unappetizing dish to offer the poor calf.

How can any man justify the Whole Milk System, it has many more evils not yet touched on, as all the milk in a district is mixed and tubercolosis has a most favorable means to spread.

There is a lot of unnecessary work for the butter makers, and another lot of heavy labour for the dairyman as well, and we found with a separator convenient to the milking stable we could separate, feed the calves at the same time, clean the machine and do all much quicker than to gather the night and morning's milk daily in summer, take it to the road, hitch a horse at noon to go after it again, as there was a hill to mount and then go and feed the poor calves. This also was a daily task.

Now, after four years with the Cream Gathering System, summer and winter, without a break and taking some $1000.00 in a year for cream from 13 cows, besides raising almost all the calves and making prize winning calves of them too, thoroughly testing our cows from year to year, as well as many separators, handling different conditions of milk and cream, I will give what I csnsider the chief objections to the general use of the hand separators on the farm.

I noticed sometime ago a writer, who was criticising this system, made this statement: "Theoretically this is the correct method, practically it is a failure." In some instances he may be correct, and why, because of the abuses of the system which might be easily corrected. Chief of which is, neglecting to thoroughly wash the separator, failing to keep the cream at a sufficiently low temperature, skimming too thin cream and not delivering often enough.

Now, none of these are serious difficulties and any butter maker with the right back bone can correct every one of them in his factories, as some one has rightly said in this regard: "If we would all do as well as we know," it would be all right, as about all the directions necessary in the care of cream is summed up in "keep it clean" and "keep it cold."

In the vicinity in which I am dairying four Creameries, four years ago, yes, and three years ago, were altogether Whole Milk Gathering. Last summer only one took a little milk, one has sold out to the others, and the others are doing a much better paying business.

This will give an idea how farmers, who may be bitterly opposed to this system can so quickly change. Well, experience was the teacher, first one started and the others had to. Now, we make a better grade of butter, particularly in winter, than we ever did. Our maker keeps advocating the Heavy Cream Doctrine, we deliver four times a week in hot weather, three times in moderately cool and twice in cold weather. Our cream from the first average 30 p. c. fat (our own seldom gets below 35 p. c.) And here is where many patrons make a great mistake, thick cream is better for everybody, but the man who gets the butter milk, less cost to haul, less to handle at the Creamery, a better quality of cream, as pure is hard to spoil, and that much more skim milk for the patron at home. So many farmers have the mistaken idea, that when the cream is heavy and the stream is small the machine is not operating clean, perhaps some of them are not, but you can get them that can.

While the factory receives both Whole Milk and Cream, the cream prtrons receive about 11 cents per 100 lbs. more out of their milk, estimating that their milk tested as former years. The price of manufacturing the butter was cut from 3 1-2 cents to 3 cents per pound the first year, and will be further reduced this year to 2 3-4 cents or 2 1-2 cents.

I have taken many samples of skim milk for testing at different speeds, different temperatures of milk and speed, etc., and can say that the chief trouble with the separators not skimming clean is "not enough speed." If the milk is taken directly from the cow to the machine and it is a good one, one can get perfect skims up to 40 p.c. fat. Any good machine will skim down to that reading with cream at 35 p. c. fat, provided, a proper speed is maintained throughout the separation, the separator properly cleaned and the milk is warm and fresh. And to the buyer, I would say, above all things, get a good large separating machine, It is not how much per hour should influence you, but how much in ten minutes. This is the hardest thing to get beginners to believe and almost everywhere they start with too small a machine. A few dollars extra in this will save many hours, save msre on our machine and on your muscles and patience.

See that you get a machine "right down to date;" Manufacturers of those have made great improvements in the last few years, and in new districts often try to unload the out-of date make. A good machine well housed, cleaned and oiled, has many years of life, but get your butter maker to test your skim milk from time to time, to keep track of how it is working, as butter fat is a valuable product and slight losses throughout the year will soon pay for any repairs needed.

Jerseys Most Economic Dairy Cows.

Editor Maritime Farmer:—

The Jersey Breed originated on the Island of Jersey, situated in the English Channel. It is claimed that they have been bred pure for 500 years; no cattle being allowed to be imported to the Island except for slaughtering purposes. During that time the breed has been steadily improved, especially in prolonged milk giving and in milk rich in butter fat, until to-day they stand without a peer in these respects.

The first known importation of Jerseys to America was made in 1850.

DESCRIPTION OF THE BREED.

The Jersey is a medium sized breed, the average weight for cows being about 1000 pounds. She is very refined in form, fine in the bone with straight and graceful lines, face dished, eyes large and prominent, color grey or golden fawn with black points, altogether making a deer-like form, very pleasing to the eye.

POPULAR FALLICIES.

We wish next to deal with the popular fallicies regarding the Jerseys. The most popular of those fallicies, and the one with the least foundation of fact, is that they are delicate animals.

Now, there is nothing that is harder to kill or that people are more ready to believe than a wrong idea about anything, and many people no doubt, will go on holding this wrong idea of Jersey cattle during the remainder of their lives, and if they are dairymen who ought to possess herds of the most profitable breed known to man, they are all the time standing in their own light.

Sylvia of Maple Grove—C. J. C. C.. 1086.

This Jersey Cow shown in the above cut was bred and is owned by Wm. Clark & Sons, Maple Grove Farm, North Wiltshire, P. E. I. Mr. W. R. Clark, one of the junior members of this progressive firm is the author of the article on "The Jersey Cow," appearing on this page. Sylvia of Maple Grove is by Gem's Mirror—48396—A. J. C. C. out of Roselin of Maple Grove—153301—A. J. C. C. and her yearly official test record is as follows:—

Milk, 8757 pounds; butter fat 475 pounds. Value of butter fat and skim milk $160.50. Value of food consumed $73.59 leaving a profit of $86.91, besides a handsome bull calf which is offered for sale in this issue.

There is absolutely no foundation of fact that the Jersey is a delicate animal. It is true the breed did pass through a stage when on account of too much inbreeding the constitutions of a large number of animals became impaired, but nearly every other breed of live stock have passed through a like stage. The breeders see their mistake and immediately start to rectify it. The Jersey breed has suffered no more from this mistake than any other breed, and to-day, the Jersey breeders are breeding as healthy and as strong constitutionally cattle as any in the world.

We believe that the reason why many people holding this wrong idea is that the Jerseys with their natural refinement of form and especially the light delicate color which is so peculiar to the breed, suggests to the average mind a delicate constitution. But those who have had experience with this breed find that such is not he case. We have seen times without number, indeed too often, high grade and pure bred Jersey cows roughing it with a lot of mongrels, more hair than anything else, and the Jerseys were adapting themselves to their conditions, growing heavy coats of hair and resisting the inclement weather as well as the best of them. Of course no self-respecting dairyman would make his cows withstand conditions such as these. However. this shows that the Jersey cow can and does adapt herself to all conditions, and is as well suited to a cold climate as a warmer one. We are confident that any person who is fair mind-

ed enough to look at this will no longer hold the foolish idea that the Jersey is delicate.

Then there is the popular belief that the Jersey cow will not consume any amount of roughage or coarse fodder; this is also a mistake. We do not claim that she can consume as much coarse fodder as a larger cow but we do claim that she can consume as much in proportion to her size as do cows of other breeds, and what is more essential, will give a better account of it. At time of writing in our own heard we are feeding fodder corn, large, heavy stalks, without cutting and the cows clean up large quantities of it, while nearly every dairyman with herds of the larger breeds would never think of feeding without cutting. In our own stables we have never run a stalk through a cutting box. We find that they will also consume large quantities of hay and other roughage.

There is no need of anything being said as regards the quality of Jersey milk. The Jersey has proved beyond doubt, that her milk will produce more butter fat and more solids not fat than the milk of any other breed, and also that the quality of the butter and cheese manufactured from her milk cannot be equalled. As regards quantity here again we have the result of a mistaken idea. Because the Jersey cow, as a rnle, gives a small daily yeild of milk she is condemned as a poor milker. The fact that she is a persistant milker is altogather lost sight of. Happily, however, the advent of yearly tests are proving that the Jersey in proportion to her size, gives as large a yeild of milk during the year as does cows of other breeds. It might be of interest to the readers for us to give a few yearly records from a long list that lies before us ; we will give three of the largest and three of the smallest:

	MILK	BUTTER
Jacoba Irene,	17253 lbs	1121 lbs
Sophie 18th	14873 lbs	1005 lbs
Olga's 4th Pride	16275 lbs	1002 lbs
Ben Hur's Witch	11265 lbs	701 lbs
Alphea Elfath	13329 lbs	701 lbs
Spermfield Owl's Maid	10128 lbs	700 lbs

While no wonderful yields of milk, if it can be called milk, are claimed for the Jersey, she must not be considered a poor milker.

ECONOMIC PRODUCTION

Now we will take up the point that to our mind is by far the most important point for the consideration of any man who is making his living by dairying i. e. economic production or a minimum amount of feed to produce a maximum amount of dairy products.

Time and again has the Jersey cow proven that in this respect she stands without a peer. Our only regret is that the cost of production is not taken into consideration in all public tests and until this is done, the Jersey cow is not receiving fair play. The cost of production is more important than a large production of milk, as anyone will readily understand that a large amount of milk produced at the same or a lower profit than a smaller amount of milk involves a large waste of time and labor. Therefore we would urge upon all promoters of public tests the importance of taking into consideration the cost of production. However, there has been tests conducted on this line and we will now give a short summary of the results obtained in some of these.

In 1893 at the Chicago World's Fair, an official test was conducted, covering a period of 140 days, with the result that the Jersey herd gave the most milk, made the most cheese of the highest quality and the most butter of the highest quality and produced them at the least cost per pound. The six leading cows were Jerseys and the Jerseys won the sweepstakes award for the best five cows.

At the St. Louis Worlds Fair the dairy test lasted 120 days. There were seventy cows of all breeds entered. We will give a few of the results as regards the Jersey and her nearest competor, the Holstein. It cost $5.48 per cow less to feed the Jersey than it did to feed the Holsteins. In the production of butter the Jerseys made an average net profit per pound of 14 1-2 cents, Holsteins 11 1-2 cents. In the production of milk the Jerseys made $7.06 per cow more profit than did the Holsteins. In this test the leading cow was a Jersey; the best four were Jerseys ; fourteen of the best fifteen were Jerseys ; seventeen of the best twenty were Jerseys and the best herd was the Jersey herd. The full particulars of these tests, which would take up too much space to give here can be had from the Secretary of the A. J. C. C.,8 West 17th St., New York. These particulars show that the Jerseys made more cheese, more butter, gave more solids other than butter fat, required less milk to make a pound of cheese, required less milk to make a pound of butter, produced a pound of butter at less cost, made cheese of higher quality, made butter of higher quality and demonstrated their ability to profitably assimilate a greater quantity of feed and retain a net increased profit than did any other breed. The official test proves these to be facts and at the same time proves that the Jersey cow is the greatest dairy cow in all essentials, that the world has ever produced,

That you may not think that we are making an extravagant claim we wish you to note that word "essentials". What is the most essential point in a dairying cow ? Every dairyman has to admit that it is the ability to produce a maximum amount of dairy products from a minmum amount of feed, in other words "economic production." That the Jersey cow leads all others in this respect has been proved beyond a doubt.—W. R. Clark, North Wiltshire, P. E. I.

Growing the Montreal Melon for Market.

The Muskmelon, Cucumis melo, is well and favorably known, so well known is it that we seldom stop to think of its origin or evolution. There has been much word play concerning both ; but the truth is hard to arrive at.

It is quite certain however, that the melon is indigenous in India and Africa. Concerning the first the whole of British India and Beluchistan is their national area. The fruit varies from the size of a plum to that of a lemon. It is either striped or barred, or all one color, scented or odourless. According to Roxburgh the Indians gather and have a taste for the fruits though they do not cultivate them.

In Africa the melon has been found growing wild in the sands on the banks of the Niger. The natives eat the fruit, which is oval and about the size of a plum.

From India the fruit found its way to China in the eighth century of our era. The fruit was insipid and small and had little to recommend it. Since the Renaissance improved cultivation and relations with the East have introduced better varieites into the European gardens; but it was not until our own day that really excellent varieties have been established.

Montreal was founced 1642. I have been unable to find out just how long after that, that French priests brought Melon seeds to the Island or Montreal. That they brought them is quite certain. Just what the fruit was like when first grown here, perhaps will never be known, as it would seem that no records exist. Neither do we know whether there was any crossing with other sorts in attempting to improve it, or whether selection was the only agency employed ; but we do know that the Montreal Melon is an established fact.

Gorman. Montreal Melons Decarie.

Two men Decarie and Gorman, their children and their children's children have been mainly responsible for its improvement. Two types have gradually envolved, one of which is somewhat flatter than the other. This is the Decarie, and the other Gorman type.

These Melous obtain great size. One specimen in the writer's garden weighed 19½ lbs. and they often become larger. The largest is sometimes a little coarse and the flavor not so excellent as the medium sized ones. This does not always follow, however.

The flavor of this melon is what is the most sariking, and what has gained for it its renown. It is not so long ago when these melons brought on the Montreal Market 30c. a piece, but this was when the trade was local. When our American friends got a taste of the real thing, the demand from Boston and New York became so great that the price went up. This year at the beginning of the melon season it was not difficult to obtoin $18.00 per dozen for medium sized specimens and some sold retail at the same time for $2.25 each. This is extraordinary in view of the fact that the Ontario melon sells normally at 30 or 40c.

The seed at MacDonald College was sown in flats on March 25. These were pricked out and placed in 4 inch pots on April 7th, one plant to the pot. If greenhouse is not available a hot bed may be used and equally good plants obtained. On May 13 the plants were taken to the field and transplanted in hot beds specially prepared for the purpose.

The frames are the same as the ordinary, and the soil should be light and of good quality. Through the centre a trench is dug usually about 18 inches wide and 9 inches deep. These measurements differ much with different growers. These trenches are filled with hot manure tramped down firmly to within four inches of the surface and covered with good soil. The plants are set directly over this manure, as soon as the soil has warmed up.

Eight plants are placed in each frame and covered carefully for cold

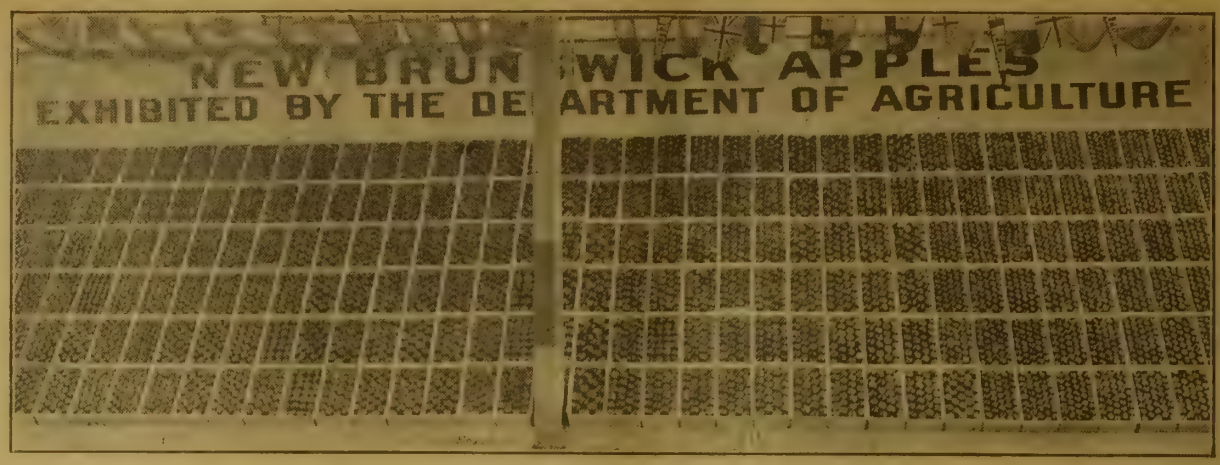
N. B. Fruit Growers' Annual Convention.

The annual meeting of the New Brunswick Fruit Growers' Association was held in St. Andrews Rink, St. John, N. B., on October 31st to November 2nd. That the various members of the Association felt greatly encouraged in their work owing to the magnificent fruit show which was being held simultaneously with their meeting can well be imagined. There was a record attenance and notes of optimism prevaded the lectures and discussions that followed.



New Brunswick Export Apples.
A section of the New Brunswick Government's Exhibit at the recent N. B. Fruit Show. There were 419 Boxes in the display

Mr. C. N. Vroom, president of the Association occupied the chair and read the following address :

To the members of the New Brunswick Fruit Grower's Association :

It is with pleasure that I greet you again in the annual convention of our Association. From the nature of his business a fruit grower is habitually of a cheerful countenance, but the result of the past season's work should adorn his face with beams of gladness. The year has been a prosperous one. The cheery smile of the fragrant Spring blossoms was in due course of time replaced by the radiant glow of the maturing fruit, until the laden trees bent their heads in silent acknowledgement of the generous bounty of the Giver of all good gifts. It is fitting that the time of displaying our fruit should be fixed at the time of our national Thanksgiving, and that animate and inanimate creatures should unite in their paeans of praise.

While our fruit fair in St. John last season was somewhat in the nature of an experiment, we had occasion to congratulate ourselves on its eminent success. Attention was drawn to the capabilities of this province for fruit growing as it never had been before and it resulted in greater interest in our apples both on the part of those who were already in the business of growing them and also on the part of those seeking a profitable investment of capital. We are desirous of new settlers for our abundant farm lands, and nothing perhaps will do more toward attracting them, than the proper setting forth of the advantages our province offers for the growth of good fruit. First we must convince our own people that we can raise apples that the world cannot beat, and this I believe our annual exhibitions are doing, then let the gospel of good apples go abroad. We have the soil and the climate for raising apples which will take first rank in every respect, and the number of growers who are seeking for the best methods in raising and handling the crops is annually increasing. But while there has been a good crop of fruit generally, it has been demonstrated to us again as it is being demonstrated in each succeeding year that the man who takes the pains is the man whe reaps the gains. While fruit has been singularly free from fungus growths, and in our section it has not been a bad year for the Codling Moth, other insects have been somewhat plentiful. The Orchard Tent Caterpillar was present in great abundance and the Forest Tent Caterpillar in some cases entirely denuded the trees of both fruit and foliage, while the Fall Web Worm seems to increase its depredations from year to year. The orchardist who has used the means for combating these enemies, which science has placed within the reach of all is the man who now rejoices that he had the courage to take a step forward in the march of progress.

There are two points in the work of an up-to-date orchardist which cannot be too strongly emphasized. I refer to the spraying of the trees and packing the fruit. Perfect spraying will give us perfect fruit and control the insect enemies. I am inclined to believe that a little preventive work is the best in the case of the Orchard Tent Caterpillar as it may almost entirely kept away by destroying the egg mass. A careful examination of the fruit trees at any time between the fall of the leaf and the coming of the new leaf, will reveal the rings of eggs encircling the twigs, and when they are within reach they may be easily removed with the finger nail, and when above reach with the hand, this twig may be cut off with a pruner. In the case of spraying, no man who intends to do any business in fruit growing can afford to neglect it. It is an essential to success. The best results in orcharding of course call for cultivation, fertilizing and pruning, but much of the labor along these lines is thrown away if spraying is neglected. It is in the nature of an insurance against the spread of fungus diseases and the inroads of insects. If a man sets out a few trees for the fun of the thing, he may afford to let them go and bear or not as they choose, but if he purposes to do any business in fruit and reap a benefit from it, he must spray. Without spraying he will gather a small crop of inferior apples, in some seasons 75% of them being No. 2 or poorer, while with proper spraying the trees will yield a much larger crop with 75 p. c. of No. 1 fruit.

Then when the fruit is grown and carefully gathered comes the marketing, and to market for best returns the fruit must be properly packed. We may as well acknowledge that we are in our infancy in this business, and the worst of it is that many do not seem to have awakened to the fact that they have anything to learn. The very meagre attendance of the members at the meetings of the convention last year would indicate this. These meetings were, to the fruit grower, equal to a short course at one of our agricultural colleges, as the program was rich in addresses by some of the best talent in the Dominion in the line of fruit growing, and yet when the teachers come to our very doors, many of the members of the Assocsation apparently cared too little for the teaching to give their time to attend. There are many orchards in the province of considerable size, where the owner has little knowledge of the proper methods of packing, either in barrels or boxes. While spraying is a necessity in the growing of good fruit, proper packing is a necessity for the obtaining of the best prices for it. A slouchy, hit or miss pack, either in barrels or boxes, will not do in the present day, Apples must be graded to size and quality and packed scientifically. The style of package, whether box or barrel, will depend largely on the variety and quality of the fruit. For fancy fruit the grower will get better returns and better please his customer, by packing in either the standard box or a basket of lesser capacity.

Speaking of varieties, leads me to the suggestion that every grower should conduct an experimenral orchard to a limited extent. It is unsafe to plant largely of any one variety on the recommendation of any Western fruit grower or nurseryman, or even on the recommendation of some one in another part of the province. As an illustration of this let me instance the Red Astrachan, which grows to perfection in my district, but scions from the best bearing trees there, grafted in an orchard 30 miles distant, where Kings and other varieties do well, yield an inferior fruit. While it may be true that for a commercial orchard, only a few varieties should be planted, I believe that a man can never rest quite satisfied that he has the best varieties obtainable for his own locality. The number of varieties must depend largely on the market. If a man aims to supply the local market or a city market and holds his customers, he wants varieties following one another all through the season, and of the new varieties constantly coming to the front there may be something that will better suit the local conditions of soil and climate than anything he may be raising. The quickest test of these varieties is of course by grafting into bearing trees, and one tree will hold a number of varieties until they come to fruiting. Many of our orchardists planted quite largely of Ben Davis a few years ago, as it was boomed by a Western nursery concern. While a western grown Ben Davis is a fair apple, I think a man makes a mistake by giving it orchard room here. I have been met with the statement that the apple was a good seller in the spring when other apples were scarce, but I have only to say that a better apple grown on the same tree would sell better and give the orchard and incidentally the orchardist a better name. I have also been told that this apple is a great keeper, but so is any other piece of wood if given the same chance. I have seen these apples thrown out of an ordinary cellar when two years old, to make room for better fruit. So long as there was anything else in the apple line to use, these remained untouched. Then again I doubt if we should raise American Baldwins when New England can raise them of a better flavor. Let us get down to those varieties in which we can excel or at least match any other section of this continent. With such varieties as the Yellow Transparent, New Brunswicker, Red Astrichan and Williams Red among early fruit; Wealthy, Femeuse and McIntosh Red in later season; and Golden Russet, Bishop Pippin, King with many other excellent varieties, we have no lack of choice fruit, and can afford to leave to any other part of the country any varieties in which they can beat us either in size, color flavor or keeping qualities

Before closing, I would like to say a word to such as may hear me, who do not make a specialty of raising

(Continued on page 97.)

The Nova Scotia Horticultural Show.

In writing us re the recent Nova Scotia Horticultural Show, Mr. I. B. Oakes, its painstaking secretary, says:—"The exhibition was a great success. It produced the finest display of fruit ever seen in the Maritime Provinces. The weather conditions were favorable. The rink accomodations are the best outside of Halifax and the financial outcome is very satisfactory, there being a substantial surplus of several hundred dollars after all expenses are paid."

While fruit was the main feature of the Show, several other branches of industry were well represented, and judged as follows:—

Apples on plates and in barrels and boxes—G. H. Vroom; Pears and Plums—S. C. Parker and Prof. Shaw; Ornamental Plants and Flowers—T. A. Smith and A. J. Woodman; Roots and Vegetables—G. B. Magill; Industrial and Educational—Profs. Sutherland, Haycock and Perry; Domestic—Mrs. W. L. Archibald and Mrs. Harriett Starr; Dairy Products—J. R. Starr; Grains and Seeds—S. J. Moore Horses—Sherriff J. S. Harris.

Following is a list of the Prize Winners in the Fruit division:—

APPLES.

Best and most valuable collection, not to exceed 20 varieties 5 specimens each—Mrs. William Sangster, Falmouth; Benjamin Lawrence, Falmouth; J. A. Magee, Port Williams; Arthur C. Johnson, Wolfville; B. F. Chesley, Clarence.

Best collection, 10 commercial or export varieties, 5 specimens each—H. E. Bent, Tupperville; Millie Sangster, Falmouth; H. D'Almaine, Wolfville; Benjamin Lawrence; Emerson F. Johnson, Greenwich.

Best collection, 5 commercial or export varieties, 5 specimens each—Fred L. Johnson, Greenwich; B. F. Chesley; Mrs. Arch Curry, Falmouth; W. R. S. Gow, Grand Pre; Arthur C. Johnson.

Best plate of 5 Apples of following 10 varieties.

Prizes in order named:

Gravensteins—G. E. Magee, Church St.; Arthur Gravatt, Berwick; H. D. Johnson, Wolfville; H. A. D'Almaine; J. A. Magee; Arthur C. Johnson; Mrs L. C. Hutchinson, Wolfville; H. Loomer, Falmouth.

Ribston—J. A. Magee; H. D. Johnson; A. N. Griffin, New Minas; A. C. Johnson; Fred Fielding, Kentville; Joseph Boyd, Falmouth; A. C. Murphy, Port Williams; H. E. Bent.

Blenheim—Arthur C. Johnson; Thomas H. Morse, Berwick; B. F. Chesley; H. Loomer; A. H. Westcott, Melanson; Laurie E. Healy, Church St.; H. E. Bent; G. E. Magee.

King—James R. Gow, Grand Pre; Arthur W. Smith, Waterville; H. A. D'Almaine; Fred L. Johnson; H. E. Bent; B. F. Chesley; H. L. Chipman, Chipman Corner; Edward C. Johnson, Wolfville.

Golden Russett—G. E. Magee; C. A. Patriquin, Wolfville; S. A. Bowser, Grand Pre; B. F. Chesley; Geo. B. Woodworth; H. E. Bent; H. D. Johnson; J. A. Magee.

Baldwin—J. D. Sherwood, Wolfville; Victor W. Alward, Falmouth; A. C. Johnson; Arthur Gravatt; A. H. Westcott; H. D'Almaine; G. E. Magee; L. E. Healy.

Spy—L. E. Healy; Ross W. Collins, Port Williams; H. Loomer; Aubrey J. Smith, Falmouth; R. S. Palmer, Windsor Forks; C. C. Brown, Greenwich; Joseph Boyd, Falmouth; H. D. Johnson.

Fallawater—L. A. Healy; A. N. Griffin; Mrs. A. C. Chesley, Grand Pre; R. S. Palmer; B. F. Chesley; Alfred S. McRae, Grand Pre; J. A. Magee; Asaph B. Robinson, Nicholsville.

Nonpareil—H. D' Almaine; A. H. Johnson; Z. O. Hardacker; H. D. Johnson; Mrs. William Sangster; B. F. Chesley; Creighton Wood, Port Williams; J. A. Magee.

Alexander—H. Loomer; E. J. Armstrong, Church St.; C. Wright, Middleton; L. E. Healy.

Banks Grav.—Benjamin Woodworth, Church St.; I. B. Oakes, Wolfville; H. E. Bent; Fred L. Johnson.

Ben Davis—Fred L. Johnson; J. O. Hardacker; B. F. Chesley; Thomas H. Jackson, Berwick.

Bishop Pippin—H. E. Bent; A. C. Johnson; B. F. Chesley; H. D. Johnson.

Boskoop—W. J. Chipman, Chipman Corner; H. L. Chipman; J. W. Selfridge, Wolfville; S. A. Bowser, Grand Pre.

Dudley or North Star—L. E. Healy; Fred L. Johnson; H. D. Johnson.

Gloria Mundi—J. A. Magee; H. D'Almaine; H. D. Johnson; H. Loomer

Hubbardston—Mrs. A. C. Chesley; S. Avery Bowser; W. W. Jacques, Church St.: H. L. Chipman.

McIntosh—J. A. Magee; H. Loomer; Percy G. Lawrence; C. F. Trenholm, Grand Pre.

Ontario—J. D. Sherwood; H. D'Almaine; A. C. Johnson; J. O. Hardacker.

R. I. Greening—H. E. Bent; C. F. Trenholm; D. D. Lyman, Wolfville; Emerson F. Johnson.

Seeks—Joseph Boyd; R. S. Palmer; J. D. Sherwood; A. C. Johnson.

Talman Sweet—Creighton Wood; G. E. Magee; J. D. Sherwood; Arthur C. Johnson.

Pomme Grise—Joseph Boyd; Benjamin Lawrence; Benjamin Woodworth; Thomas Aylward.

Wagner—L. E. Healy; Chas. H. Wright; C. A. Patriquin; Thomas H. Morse.

Wealthy—A. H. Johnson; E. F. Neily; H. D. Johnson; B. F. Chesley.

Cox's Orange—H. Loomer; R. S. Palmer; G. E. Magee; Benj. Woodworth.

Spitzenburgs—H. Loomer; Arthur Johnson; R. S. Palmer; H. E. Bent.

Wolf River—Thomas H. Jackson; J. A. Magee; L. E. Healy; Thomad H. Morse.

Arctic—Geo. P. Magee; Wm. Black, Wolfville.

Baxter—J. A. Magee; Joseph Boyd.

Brightheimer—Benjamin Woodworth, Sorey J. Stewart.

Bismark—Arthur Johnson; H. D'Almaine.

Black Ben Davis—W. S. R. Gow; T. E. Smith, Clarence.

Champions—W. S. R. Gow; W. M. Black.

Gano—Fred L. Johnson; Emerson F. Johnson.

Grimes Golden—C. F. Trenholm; R. S. Palmer.

Ingram—T. E. Smith.

Jonathan—Joseph Boyd; Miss M. Sangster.

Jewett's Red—E. T. Neily; C. E. Wright.

Lawver—H. D'Almaine; Arthur Johnson.

Maiden's Blush—Emerson Johnson; G. E. Magee.

Mann—F. J. Fielding; S. A. Bowser.

Manson Sweet—Arthur Johnson; H D. Johnson.

Ohio Nonpareil—H. D. Johnson; H. D'Almaine.

Peck's Pleasant—Ross W. Collins; T. E. Smith.

Pewaukee—H. E. Bent; C. A. Patriquin.

Red Russett—T. E. Smith; Mrs. Wm. Sangseer.

Victoria—H. D'Almaine; H. D. Johnson.

Wellington—C. C. Brown; G. E. Magee.

Senator—W. S. R. Gow; T. R. Wallace.

Fameuse—H. D. Johnson; Fred L. Johnson.

(Continued on page 88).

Who Said Apples?

A Section of the Plate Exhibits at the Nova Scotia Horticultural Exhibition, Wolfville, N. S.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers. and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents; 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address all letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

R. D. Robinson Publishers, Limited,

Cor. Clarence and St. David Sts., ST. JOHN, N. B.

NOTICE TO ADVERTISERS—Changes for ads. should reach this office one week before date of issue, in order to insure insertion.

NOVEMBER 14, 1911.

DATES OF ISSUE.

November ..... 14—28

December ..... 12—26

OUR POPULATION.

The census returns for the past decade show that the Maritime Provinces have made some, though comparatively slight, progress in population. We think that the showing will be better in the industrial census and we may take more satisfaction in that, but for the present we can only deal with the population figures. Following are details :

	1911	1910	
Nova Scotia	461,847	459,574	2,273 Incr
New Brunswick	351,815	331,120	20,695 Incr
P. E. Island	93,722	103.259	9,537 Dec.
Total	907,804	893,953	13,431 Incr

The Census Bureau has given out details of changes in population in the case of a number of towns and cities. With the exception of Charlottetown (which declined 882), all have shown increases. In the returns of 1901, 16 places in Nova Scotia, 10 places in New Brunswick and 2 in Prince Edward Island had over 2,000 population, and in the returns before us there are given only 9 in N. S., 3 in N. B., and 1 in P. E. I., or 28 in all in 1901 and 13 in 1911, which is 15 less. We do not know whether the omission from the list of so many of these towns means that there have been declines there, or whether it is due to not having the returns in sufficiently good shape. We are rather disposed to think it is the latter, for such places as New Glasgow can hardly have decrcased with the well known prosperity they have been enjoying there. Amherst also must have had a very large increase.

Following are the towns and cities which have shown increases during the decade as published by the census returns :

PROVINCE OF NOVA SCOTIA.

	1011.	1901	Incr
Dartmouth	5,058	4.806	252
Glace? Bay	16,561	6,945	9,616
Halifax	46,081	50,832	5,249
North Sydney	5,418	4,646	772
Sydney Mines	7,464	3,191	4,273
Sydney	17,617	9,909	7,708
Truro	6,015	5,993	22
Yarmouth	9,571	6,430	141

PROVINCE OF NEW BRUNSWICK.

	1911.	1901.	Incr.
Fredericton	7,208	7,117	91
Moncton	11,329	9,026	2,303
St. John	42,363	40,711	1,652

The conspicuous increases according to the above tables have been in Cape Breton, where Sydney, North Sydney, Sydney Mines and Glace Bay, all in one district have increased 22,369 in the ten years. Halifax and Dartmouth, forming practically one community, have increased 5,501. Halifax and Dartmouth have a population of 51,139. Glace Bay and Sydney Mines have more than doubled and Sydney almost doubled in the ten years.

THE NOVA SCOTIA AGRICULTURAL COLLEGE.

We have the following article from Professor Cumming, Principal of the N. S. Agricultural college—it speaks for itself:—

"The Nova Scotia Agricultural College began its seventh annual session on November 1st last, with an initial enrollment of nearly 50 per cent. in advance of any previous enrollment. Owing to the labor required to handle the apple crop in Nova Scotia, a number of regular students are not able to enter the college until December and January. Consequently, in previous years the attendance at the regular course has usually increased 25 per cent. or more. The enrollment on the last of November last was 66, as compared with 43 a year ago and 17 six years ago. It is likely that the enrollment for this year will increase to about 90.

"Upper Canada readers of course understand that the constituency of the Nova Scotia Agricultural college is several times smaller than that of similar institutions in Canada and will, of course, judge the attendance accordingly. It is certainly most satisfactory to all interested in agriculturae in the East to record the steady growth which is being made at the Nova Scotia Agricultural College.

"Even more satisfactory to report than the increased attendance is the actual evidence of improvements in farming, due to the influences of the graduates of the college. Over 90 per cent. of the students who have thus far attended the N. S. A.C. are engaged in farming and it is significant that the larger proportion of the new students have come to the college from the localities where the earlier students have come from, being influenced by the improvements.

"One new creamery in Kings County, a second one now in course of erection in Yarmouth County, and a third one being organized in Cumberland County, all managed by Agricultural College graduates, are practital evidence of the influence the college is having in the development of the agricultural industry of the province. Many more evidences might be quoted, but enough is now apparent to make the people of Nova Scotia realize the wisdom of their investment in the Agricultural College.

"The College Management purposes adding several new features to their Short Course held during the first two weeks of January. Over 300 students attended the last session and everything points to a still larger attendance in January next. One of the new features will be a class in running of gasoline engines, with more especial reference to power spraying. It is also proposed to greatly strengthen the ladies' part of the Short Course and make this increasingly attractive.

"The people of Nova Scotia have responded so well to the efforts of the Agricultural College that the management feel thoroughly confident in making every preparation for increasing numbers of students in all courses."

While our average farmers can not take the full course, no one can afford not to take advantage of the opportunities offered by the Short Courses which will be held during the first two weeks in January. Give this matter your serious consideration and do your best to have some one of your family attend the Short Courses next January.

HARDWOODS.

Canada is dependent for its lumber supply on the soft woods of the forest much more than in the United States, as seen from the 1910 Forest Products report compiled by the Dominion Forestry Branch and shortly to be published. Of the 1910 Canadian lumber cut amounting to nearly five million feet, only one-twentieth consisted of hardwoods or broad-leafed trees, worth barely five million dollars; on the other hand almost one quarter of the lumber cut in the United States consists of hardwoods, which country had far greater hordwood forests than ever did Canada. Canada is already feeling a shortage of the hardwood supply and makes up the national deficiency by importing annually from the United States, hardwood lumber to the value of seven and a half million dollars. Thus the value of the hardwoods imported into Canada during 1910 cxceeded by 50 per cent the value of the hardwoods manufactured into lumber. Nearly all of these imports are from the United States and consists of the most valueable species such as Oak, Hickory, Tulip or Yellow Poplar. Chestnut, Gum, Walnut, Cherry and a large amount of hard pine which is so frequently used as a hardwood. From these above figures it is seen that we are becoming more and more dependent upon the United States whose available supply for export is surely and rapidly decreasing. Whatever can be done to improve the resources of Canada by the elimination of wood waste, and particularly by the development of the small wood lots of Ontario, Southern Quebec and the Maritime Provinces, should be done with all possible speed.

LEARN TO MAKE REPAIRS.

A boy we know who hopes some day to be a farmer will sit 15 minutes on a rake or mower and call for someone to tighten a nut or adjust another bit of mechanism. If he succeeds he will have to learn to do these things himself, for every farmer must be a machinist. The man who can put a reaper together after he has seen it done will do well, but the man who can do it without having seen it done will do better. Time on the farm, as anywhere else is money, and when a tongue breaks it is money in the pocket to be able to repair it without driving to the blacksmith.

Prize Winners at the New Brunswick Fruit Show.

Best Plate, 5 Apples.

McINTOSH RED:—1, J. W. Clark, Maugerville; 2, F. A. Hubbard, Burton; 3, J. C. Gilman & Son, Fredericton; 4, J. P. Jewett, Sheffield Academy; 5, Slipp Bros., Upper Hampstead; 6, C. N. Vroom, St. Stephen; 7, Geo. MacAlpine, Lower Gagetown; 8, G. W. Stephenson, Sheffield.

FAMEUSE:—1, John E. Holder, Lower Cambridge; 2, J. C. Gilman & Son, Fredericton; 3, W. P. & F. N. Fox, Lower Gagetown; 4, F. A. Hubbard, Burton.

DUDLEY:—1, H. Smith, Long Reach 2, G. E. Babit, Swan Creek; 3, I. W. Stephenson, Sheffield; 4, R. E. Flewelling, Oak Point.

WEALTHY:—1, H. Wilmot, Oromocto; 2, B. F. Peters, Queenstown; 3, F. A. Hubbard, Burton; 4, Mrs. E. W. Darcus, Fredericton.

BETHEL:—1, D. L. Martin, 2, F. W. Short, Brown's Flats; 3, R. E. Flewelling, Oak Point; 4, Frank W. Short, Glenwood.

NEW BRUNSWICKER:—1, T. Adney, Upper Woodstock; 2, J. C. Gilman & Son, Fredericton 3, J. W. Clark, Maugerville; 4, J. A. Jewett, Sheffield Academy.

DUCHESS:—1, J. W. Clark, Maugerville; 2, I. W. Stephenson, Sheffield; 3, J. C. Gilman & Son, Fredericton; 4, T. L. Alexander, Fredericton Junction.

BAXTER:—1, J. C. Gilman & Son, 2, J. E. Holder, Lower Cambridge; 3, Cossar Farm, Lower Gagetown; 4, St. John Valley Fruit Co.

ALEXANDER:—1, J. P. Jewett, Sheffield Academy; 2, Geo. MacAlpine Lower Gagetown; 3, B. F. Peters, Queenstown; 4, J. C. Gilman & Son, Fredericton.

WOLFE RIVER:—1, Slipp Bros., Upper Hampstead; 2, Geo. MacAlpine, Lower Gagetown; 3, F. A. Hubbard; 4, D. I. Williams, Long Reach.

Best Plate, 5 Apples.

GOLDEN RUSSET:—1, J. C. Gilman & Son, Fredericton; 2, Geo. MacAlpine, Lower Gagetown.

KING OF TOMPKINS:—1, E. Martin, Deer Island; 2, H. Smith, Long Reach; 3, Lester Wood, Carter's Point

NORTHERN SPY:—1, Geo. MacAlpine, Lower Gagetown; 2, R. E. Flewelling, Oak Point; 3, H. Smith, Long Reach.

RHODE ISLAND GREENING:—1, S. L. Peters, Queenstown 2, B. F. Peters, Queenstown; 3, C. E. Dixon, Hampton.

BISHOP PIPPIN:—1, Cossar Farm, Lower Gagetown; 2, W. P. & F. L. Fox, Lower Gagetown; 3, Slipp Bros, Hampstead.

MILWAUKEE:—1, J. C. Gilman & Son, Fredericton; 2, T. L. Alexander, Fredericton Jct.

BEN DAVIS:—1, W. P. & F. L. Fox, Lower Gagetown; 2, Cossar Farm, Lower Gagetown; 3, St. John Valley Fruit Co., Burton.

Best Plate, 5 Apples.

PRINCESS LOUISE:—1, I. W. Stephenson, Sheffield.

GRAVENSTEIN:—1, Geo. MacAlpine, Lower Gagetown; 2, B. F. Peters, Queenstown; 3, S. L. Peters, Queenstown.

RIBSTON:—1, Cossar Farm, Lower Gagetown; 2, T. L. Alexander, Fredericton Jct.

BLENHEIM PIPPIN:—1, Geo. Mac Alpine, Lower Gagetown; 2, R. E. Flewelling, Oak Point; 3, T. L. Alexander, Fredericton Junction.

GRIME'S GOLDEN:—1, T. L. Alexander, Fredericton Jct.; 2, I. W. Stephenson, Sheffield.
town; 3, I. W. Stephenson, Sheffield.

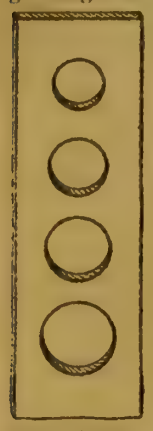
Silver Cup offered by St. John Board of Trade for Best Boxes of Dessert

(Continued on page 99).

HORTICULTURE.

Grading and Boxing Apples.

The first requisit in catering to the box trade in apples is to grade the fruit as to size and quality. In the margin is shown a drawing of a grading board which is used only at the start, because men and women soon train their eyes to recognize differences in sizes. The board is about 2 feet long, 6 inches wide, and the holes vary in diameter from 2 3-4 to 3 3-8 inches. The apples must not be small enough to drop through any of these holes, in order to meet the size of the various grades.

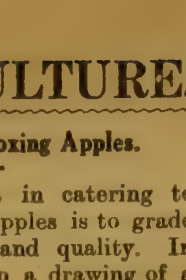


Grading Boards

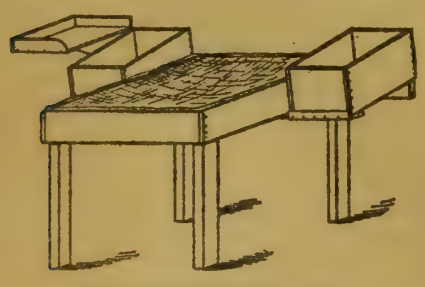
The packing table, found most useful, is illustrated in the large drawing shown herewith. It is about 3 feet high, 3 feet wide and three feet long. The legs are made of 2x4-inch material, and beveled off at their tops so as to leave no corners which would bruise

Too Full, Just Right, Not Full Enough.

the fruit. The sides are 6 inches high and 1 inch thick. The top is covered with canvas, which is allowed to sag rather loosely. In order to save bruising the fruit rubber hose is nailed around the top of the table. A board is nailed across the end and another at the side to serve as supporters for the boxes, which are placed at an angle, as shown. The tray shown at the left is for holding paper, which is wrapped about each individual apple. Apples of only one size are brought to the packing table at one time, so as to facilitate packing. The packer begins by first lining the box with paper a trifle smaller than the length of the box. The ends are rarely lined. Next a layering paper

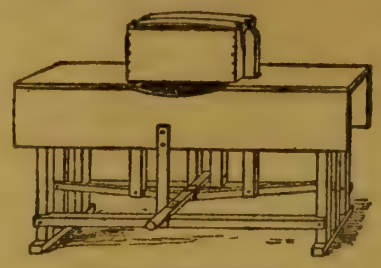


Diagonal Plan



Packing Table for Box Apples.

is placed on the bottom, and as layers of apples are packed other layers of paper are placed between them, and on the top before the lid is nailed on. The apples are placed in a variety of ways in the boxes. One of the best of these is shown herewith. As the boxes are nailed, the fruit must be slightly rounded toward the middle, so that when the top is nailed on there will be a slight bulge, as in the drawing which shows three boxes packed. The box at the left is too full, the one at the right not full enough and the one in the center just right.



Nailing Table and Press.

After the boxes have been filled, they are placed as shown on the nailing table. This table has a vacant space in the middle over which the box is laid. An upright clamp is applied to hold the top down by means of a lever operated with the foot. As soon as the nails are driven the lever is released and the box removed.

Cost of Producing Apples.

A correspondent of Rural New York, basing his estimate on the returns obtained from a six acre orchard containing 234 trees, half 36 years old and the other fifty, figures the cost of producing apples under normal conditions at $1 to $1.25 per barrel, depending on the crop. Taking the average of eight years he places it at $1.10 without allowing for manure. With 102 bbls. per acre it was 83c., with 35 bbls. per acre it was $1.73. In 1910 a crop of 55 bbls. per acre cost $1.20 per bbl.

In estimating the cost, this correspondent places the outlay on spraying material per acre for eight years at $2.28, the average cost of barrels per acre $21.76, interest $5.67, equipment charge $4.58, management, etc, 75c., labor cost $37.61, making a total of $72.95. This takes in everything except manure, which is put at 6c. per bbl. of fruit produced. In estimating the labor cost he puts $4.25 per day as the value of man and team.

Has any MARITIME FARMER apple grower made a similar calculation? We would be glad to hear of such.

Disgusted With Top-Working.

Nine years ago last fall I planted 600 No. 1 Baldwin trees which did very nicely. In the budding season of 1903, I decided to work the orchard over to other varieties. At this stage, the trees were all well established and had made a considerable growth. Accordingly, they were budded, some buds being placed in the lower limbs, others in the trunks. The following spring we found that a large per cent of the buds had not caught and those that did live, were so badly infested with bud moth and woolly aphis that this method of top-working was abandoned as a failure. Still anxious to top-work, we secured the service of a grafter and in 1904 had the grafting done with indifferent success in a great many instances. Where a large portion of the top was cut away to give the graft an opportunity to grow, sun-scald developed and ruined the trees. Other trees that lived made only a feeble growth, and while a small per cent lived and made a good growth, some of these were blown out by the wind, knocked out carelessly in some cases, even broken down by crows.

In the spring of 1909 we pulled the whole block out, thoroughly disgusted with top-working young trees. I think at the time we had about 100 good trees out of the 600 set. From my experience and observation, I believe the chances for top-working are far better on older established trees. It is an acknowledged fact that some varieties do better top-worked, but I prefer to grow the kinds that do well without. A great deal has been said about the influence of top-working on early bearing. In connection with this, I may say that a number of Baldwin trees which came to us in the same lot as those set nine years ago were planted in vaciencies in an old orchard, and not top-worked. Last season they bore nearly half a barrel of fruit. How I wish the 600 were as these few trees today.—WILLIAM FOSTER, IN N. E. HOMESTEAD.

Status of Dwarf Apple Trees.

The question is often asked whether it pays to to set dwarf apple trees in a commercial way. Reliable data in this connection are scarce. Probably Prof. A. G. Gulley of the Connecticut experiment station has had more experience in this line than anyone else in New England. He has a sizable block of dwarft trees of many varieties, in different stages of growth, from four to eight years. No attempt was made to obtain early results in bearing, the emphasis being on perfectly shaped trees.

Readers know a dwarf apple tree in any variety of apple budded on either paradise or doucin stocks. The paradise stock used for dwarf apples is simply a bush form of apple from Europe, and never attains much size. The doucin is another slow-growing, small, sweet, apple once very common and wild over central Europe. The stock grows larger and stronger than the paradise, getting in about half way between the latter and the natural scedling apple.

Descriptive of his methods, Prof. Gulley has the following to say: So far we have planted all trees on paradise stock 8 1-4 feet apart each way, 640 trees to the acre. Those on doucin stock are set 10 feet distant, making 435 per acre. In the latter plot, we placed 50 trees of McIntosh and Gravenstein, to see what they will do commercially. My early experience taught me that no long-armed branches are wanted, but short, stiff, stocky limbs with plenty of chances for fruit spurs.

The oldest trees on paradise stock began bearing three years ago. In 1910 about 30 varieties produced fruit, ranging from two specimens to a tree to a bushel; many had a half bushel or more. I think the early bearing qualification has been greatly over estimated, and from our experience judge the gain will not be more than one or two years. The cultivation was clean for four or five years, after that the orchard was allowed to grow up to grass, being mowed four or five times during the season. So far we have used very little fertilizer, as trees have grown fast enough. From now we will use a little potash and bone or basic slag on the trees as they come in bearing. Trees have been very healthy. Some varieties are better adapted to the practice than others, for instance, McIntosh, Wealthy, Delicious, Yellow Transparent and Grimes Golden.

The oldest trees stand about 5 feet high, and the same in breadth. They can be allowed to reach 7 feet, and those on doucin stock about 2 feet more. When so grown, all will be within easy reach of the ground, whether to prune, spray, thin or pick. I do not know just how much a crop they will produce, but that they can and will bear a bushel per tree is evident, which would be at the rate of over 200 barrels or 600 boxes per acre. Dwarf trees on doucin stock I think can readily double this amount per acre. Even a much less crop would make them very profitable, since the fruit should be practically all No. 1. I think there is no question but what they can be used satisfactorily for fillers.—N. E. H.

Peach Trees are Poor Fillers.

I object to peaches as fillers because I have to take out a whole lot of peach trees just when they are coming to the most profitable bearing, but had I peaches in solid blocks, I could hold them longer. Apples I can prune severely, and grow filler apple trees a number of years longer than any other kind of tree. On the other hand, if I attempt to grow filler trees two or three or more years longer I must prune heavily during that time, and must also fertilize liberally.—George T. Powell, New York.

Failure of Lime-Sulphur.

Sometimes the lime-sulphur mixture fails to kill the San Jose scale or hurts the tree, and the user wonders why. Professors Van Slyke and Parrott of the New York experiment station attribute it to the use of lime containing magnesia. They say that when magnesia lime is used to make the lime-sulpher wash some of the sulphur is set free entirely, throwing it into the sediment, while more of the sulphur combines with hydrogen from the water and forms the foul-smelling gas, sulphurated hydrogen, which is noticeable where such mixtures are used. Extensive tests have shown that magnesium lime is not only worse than useless for making lime-sulphur washes, but it is often a positive detriment.

Dominion Fruit Congress.

A Dominion Fruit Congress is to be held in Ottawa next December, at which representatives will be present from the various Provincial organizations.

SECOND DISTRIBUTION BY THE PRESS OF THE

University of Cambridge.

(England)

OF THE NEW ELEVENTH EDITION OF THE

ENCYCLOPÆDIA BRITANNICA

A COMPLETE AND MODERN EXPOSITION OF HUMAN THOUGHT, LEARNING AND ACHIEVEMENT.

29 VOLUMES — 40,000 ARTICLES — 44,000,000 WORDS

"When one takes up a volume he is apt to be led on from one article to another with absorbing interest. The volumes are the very triumph of the printer's and bookbinder's art, and it is a delight to handle and to read them. The book is an epoch-making book. One who possesses a copy of the Britannica has a very complete library, even if he should have no other books."—Extract from letter from Subscriber C.B. 7201.

A volume printed as heretofore on ordinary book paper measures 2¼ inches in thickness and weighs 8 pounds.

Printed on India paper, the same volume is but 1 inch thick, and in the Full Limp Leather binding may be rolled up and held in one hand.

"Concerning the eleventh edition, it is a gift of unspeakable value to all classes of readers from the plain man up, one of those human debts that money does not discharge. . . Every growing family of Canadians, pretending to any intelligence, whether they have carpets or not, ought to be provided with the eleventh edition of the Encyclopædia Britannica."—From a Review in the Manitoba Free Press, August 5th, 1911.

THE New Encyclopædia Britannica, 11th Edition (1911), is a vast repository of human thought, learning and experience brought down to the autumn of 1910. In virtue of its comprehensiveness and unfailing devotion to the exposition of knowledge, it combines three features of the widest usefulness to the present generation.

1.—**It is a register and detailed summary of the world's life and progress.**

2.—**It is a complete inventory of extant knowledge reduced to an A, B, C simplicity of arrangement.**

3.—**It is an index to all recondite, not less than to all common things in which an intelligent person is likely to be interested.**

There are 28 volumes of text, aggregating 28,150 pages, which average 1,600 words to the page. Volume 29 consists of an Index containing 500,000 references, and a complete Table of Contents giving every article-heading in the work under its proper classification. By the aid of this Index, which was carefully prepared at an expense of £15,000 ($75,000), it is believed that the reader will be able to find, in the body of the text, the answer to any conceivable question within the limits of reasonable inquiry.

The 1,500 contributors include: 1. Men of Learning (scientists, philosophers, divines, university professors, historians, economists). 2. **Men of Action** (soldiers, sailors, men of affairs, jurists, administrators, surgeons, architects, artists, inventors, archæologists, explorers, engineers, sportsmen, manufacturers, financiers). 3. **Practical experts,** men of special knowledge who are professionally engaged in the advancement of industrial undertakings for the welfare of mankind.

The sum of £230,000 ($1,150,000) was paid to contributors and editors, as well as for maps, illustrations, typesetting, plates, etc., before a single copy was offered for sale.

THE Encyclopædia Britannica, the only work which has summarized and elucidated universal knowledge in successive editions during 140 years in a manner commensurate with the expansion and international primacy of the two branches of the English-speaking race, has come, by virtue of its acknowledged excellence, to be recognized as an institution, as one of the most prized heritages of scholars and readers, wherever the language is spoken.

THREE NOTABLE NEW FEATURES

The issue of the new edition (the eleventh since 1768-71), while it is a notable literary event in itself, is signalized by three unprecedented features:

1. THE UNIVERSITY OF CAMBRIDGE

The new edition bears the imprimatur of the University of Cambridge instead of being issued by a private firm of publishers as hitherto. The added endorsement of the authority of the 1,500 eminent specialists, representing all civilized countries, who contributed to the book, served to confirm its status with a swiftness and a certainty not possible otherwise.

2. THE INDIA PAPER FORMAT

The work appears in a revolutionary format, which renders the Encyclopædia Britannica for the first time a convenient book to hold and, therefore, agreeable to read. Printed on India paper (tough, light and thin, but at the same time opaque), the volumes measure but **one inch in thickness** instead of two and three-quarter inches as heretofore, though containing **identically the same matter and produced from identically the same plates as the familiar impression on ordinary paper.**

3. THE LOW PRICE

The third new feature is the low price. The last completely new edition (the Ninth, 1875-1889) had been sold at $7.50 a volume, cloth bound, and at $10.00 a volume in Half Russia. The 11th Edition, on the other hand, is sold at prices averaging, in the several bindings, about 40 per cent. less. A single volume of the New 11th Edition contains some 1,000 pages, and over 1,500,000 words, yet is sold at only $4.50 a volume in cheapest form. In assuming control of the Encyclopædia Britannica the Syndics of The Cambridge University Press regarded its sale at a low price as an inherent characteristic of the undertaking.

They believe that **in respect of cheapness no publication can be compared with the 11th edition of the Encyclopædia Britannica at the present price.**

The 29 volumes of the new Encyclopædia Britannica in Full Limp Leather (Prayer-book style) in the special bookcase (mahogany) used only for this binding. The volumes in this beautiful format have perfect flexibility (see photograph overleaf) and each rests on its own shelf. Width of case, 16 inches. Height, 4 feet.

OVER 32,000 sets (value over $5,000,000) of the new 11th Edition of this celebrated work were sold by The Cambridge University Press, of England, before publication, and were printed, bound and delivered to subscribers within nine months—between January 20th and October 25th, 1911.

Prompt Delivery of the entire work is now assured to those who apply at once. The entire set of 29 volumes will be shipped (f. o. b. Toronto) shortly after receipt of a first payment of $5.00, or for cash in full. The work, in 28 quarto volumes (12" x 9") and index, is in two forms:

(1) On **India Paper** (very light and opaque) in four styles of binding: **Cloth, Full Flexible Sheepskin, Full Limp Leather** (Prayer-book style), and **Full Flexible Morocco, the volumes being one inch thick (about 1,000 pages).**

The India paper impression bound in either Full Sheep, Full Limp Leather or Full Morocco is strongly recommended.

(2) On ordinary book paper in three styles of binding: **Cloth, Half Morocco, and Full Morocco, the volumes being 2¾ inches thick (about 1,000 pages).**

FIRST PAYMENT, $5.00

The present low price may the more easily be afforded owing to the institution of serial payments, **$5.00 is all the immediate outlay that is required to obtain delivery of the 29 volumes, and after they have been received, purchase may be completed in monthly payments of the same amount. The work is, therefore, placed within the reach of all.**

Should the subscriber, however, find that it better suits his convenience to complete purchase in a shorter time, he may do so by making 4, 8 or 12 monthly payments, at practically the cash price.

A 164-PAGE PROSPECTUS SIMILAR IN FORMAT TO THE WORK IT DESCRIBES—POST-FREE UPON APPLICATION

The reduction in weight and bulk effected by the use of India paper has been utilized by the publishers of the new Encyclopædia Britannica in the preparation of a new prospectus in which the book is described with a fidelity and at a length attainable within a reasonable compass in no other way. In format this prospectus is a replica of the India paper impression, and it has thus been possible not only to reproduce a large number of extracts from typical articles exactly as they appear in the original work, but to exemplify in the prospectus itself, which consists of 164 pages of printed matter, together with numerous selected plates, maps, cuts, etc., the convenience and compactness of the India Paper Format.

AN IDEAL CHRISTMAS GIFT

THE supreme merit of the Encyclopædia Britannica, 11th Edition, as a gift is that it effectively imposes high standards.

The recipient feels, especially if in the formative period, that the gift of a work of such learning and authority is a subtle tribute to his intelligence, and he feels that, in accepting it, he incurs an obligation to familiarize himself with its contents.

The number of directions in which the systematic use—and this comes naturally—of the Encyclopædia Britannica may influence for good a developing mind, is legion.

For idle and listless reading, it substitutes an accurate scrutiny of the foundations of conclusions, opinions and beliefs. By its insistence on what is essential in every question, and by its elimination of all that is irrelevant, it promotes habits of concentration and analysis, and instils a sense of intellectual values. In its thousands of biographies of the men and women who have figured prominently in the human story it opens new horizons and sets up new ideals.

To some readers, it may even indicate, for the first time, their real vocation, for it is a fact that, in nearly every efficient, useful life, there is traceable, at some parting of the ways, the determining influence of a book.

Editor Maritime Farmer:—

I have not noticed anything in the Farmer in reference to Helbon DeKol, the last Holstein cow to break the Canadian 7 day and 30 day records. Thinking that the farmers and stock-breeders in the Maritime Provinces might like to know about her records and also that we have had her only son at the head of our herd for nearly three years. I have decided to write and give some of her records:—
Butter in 7 days, 31.54lbs. p.c. fat 4.5
Milk in 7 days, 558.39lbs.
Butter in 30 days 128.57lbs. p.c. fat 4.1
Milk in 30 days 2499.57lbs.

She gave 96½ lbs. milk in 1 day and 139 lbs. for her best 7 days milk, but the weather was so hot at times that she could not be held to her milk flow. She was officially tested during June and July of this year and it is generally conceded that it was the hottest summer for 20 years. She started her 30 day record 30 days after calving so it is easily seen that she is a stayer.

Helbon DeKol also holds the Canadian record for 1 year over all breeds as a three-year-old, making 16,346lbs. milk, 710.50 lbs. butter at three years and 4 months old. Her daughter Helbon DeKol 2nd, made 14889.5 lbs. milk and 657.96 lbs. butter in 1 year, at 3 years and 1 month old. Helbon DeKol 2nd, is a full sister to our bull Helbon DeKol's Prince.—Samuel Dickie, Truro, N. S.

Dairy By-Products.

There are two reasons why dairying is the most profitable line of farming. In the first place it provides a steady income and in the second place it furnishes by-products that are almost as important as the direct results of the work. In the successful management of any manufacture, the use of the by-products often spells success. Frequently the income that is derived from them is sufficient to carry on the overhead expenses of the plant. The fact that one man realizes on these by-products and another fails to, distinguishes between the successful and the unsuccessful manufacturer. Likewise on the farm the fact that one man appreciates the the importance of the industries that dairying makes possibe while his neighbor is blind to all of this great profit marks the difference between the successful and the unsuccessful dairy man. Everywhere we hear about the necessity of conserving natural resources. No line of farming makes it possible to foster these resources more sucressfully that dairying. Where a dairy herd is kept and only the butter-fat is sold from the farm, the land may be built up in productive capacity with every season. Experiments have shown that abandoned farms can be put into the profitable class merely by using the fertility provided by a dairy herd. The fertilizer then is one of the first by-products of importance. If men are going to hand down to posterity land that will yield a living for forth coming generations they must study how best to replace the elements of plant life that were taken out of the soil by each crop that is harvested. The dairy cow is the solution. This one by-product then makes it possible to take land that is depleted and restore its fertility or to retain the fertility with each crop that is harvested, always leaving a little more plant food in the soil than is taken out. In other states where it is necessary to buy commercial fertilizers the bills for these have eaten a big hole into the profits, sometimes leaving nothing for the man's work. This first by-product of dairying then is of sufficient importance to establish the industry regardless of any thing else. The second income that may be realized by the dairy farmer comes from the sale of young stock for breeding purposes. A man who has a registered herd of any of the dairy breeds can, if he will handle the business right, find a ready sale at long prices for anything that he wishes to dispose of. Even grade heifers and cows are bringing very flattering figures in every section where dairying is followed. With a herd of 10 or 20 good cows it will not be impossible to realize an income from the young stock that would be several times as large as the entire earning capacity of the average clerk or office employee. The third by-product of importance is skimmilk. A well managed dairy farm will keep practically all of this for home use. It makes it possible to raise and develop calves, pigs and chickens. The profit from the pigs needs little explanation at this time. Everyone who has had any experience in raising and marketing hogs knows the value of skim-milk and he also knows how useful the checks from the market hogs are. From this on down one may estimate the various possibilities of the farm. Poultry can be kept to better advantage and eggs are by no means an inconsiderate item on the average farm. By-products of the dairy then make it possible to raise better crops; to enlarge the earning capacity of the farm; to realize on side lines that would otherwise be out of the question. Dairy by-products are certainly worth consideration.

How I Built a Dairy Butter Trade.

The starting of our trade in dairy butter was so small that I scarcely know how it did start. My husband drives a market wagon into town twice a week, so it was an easy matter to dispose of the few pounds of butter we at first had to sell. A pound sold here and there among his customers soon brought the inquiry, "Have you any more of that nice butter?" Then they began to ask if we could supply them by the year. A neighbor would drop in to tea and leave an invitation for him to call at her house as she wanted some butter. We soon found the demand far in excess of the supply, and it became necessary to add to our herd of cows.

At that time we were using the round, half-pound print and no paper. When we substituted a handsome, square-pound print neatly wrapped in parchment paper our customers were all sure that the butter tasted better. And perhaps it did; I am not prepared to say; for pleasing the eye goes far towards satisfying the palate.

BUTTER MAKING AS A SCIENCE.

For a number of years we used creamers. Some 10 or 11 years ago we purchased a cream separator, and since then butter making has become a science with us. I have al ways been careful to read all the instructive articles on butter making I have found in the farm papers, and I do not hesitate to say that I can produce a uniform, clean, fine flavored butter, which when delivered to customers every Saturday morning, rain or shine, cannot fail to please the most fastidious.

We have never carried on a large trade in butter, but I think it may be considered successful in that we have never lost a customer through poor butter. Our custom has necessarily changed during the years, but never from discontent. One name stands on our list to-day that has seen there 18 or 19 years.

A CUSTOMER COMES BACK.

At one time when we advanced a few cents on our price one customer decided that he would not pay it. After some months he came back asking if we had any butter to spare, and when told it was still 25c., said, 'I can't help it; I have had enough 20c. butter." He has never found any fault with the price since. A lady customer after moving away instructed her friend who came to town to live to get her butter from Mrs. C., as she wanted her to have good impressions of Yarmouth.—Mrs. O. L. Churchill. Yarmouth Co., N. S.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.
We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Cream Cheese Made at Home.

The process of manufacturing cream cheese is inexpensive and simple, says Miss G. Bagnall, N.D.D., Instructor in Dairying, Macdonald College, P.Q., and the cheese is so profitable that farmers should encourage their wives and daughters to follow these instructions, so as to be able to furnish their tables with a good wholesome and nutritious article of diet. If made from fairly rich cream, it will contain from 40 to 50 per cent of butter-fat. Butter-fat is more easily digested than other fats, and should, therefore, prove most beneficial to invalids. With or without butter it is most palatable, and makes delicious sandwiches. During the three years that this cheese has been made at Macdonald College, the demand has increased from four dozen to 60 dozen a month. Here are a few reasons why the manufacture of cream cheese on our farms should be encouraged:

1. It is profitable. The cream from 100 pounds of average milk will make 25 cream cheese, which retails at 15c. each, or equal to $3.75 per 100 pounds of milk.

2. The return is quick, the cheese being marketable in three days, thus saving the expense of storage.

3. The initial cost of equipment is very small. A cream cheese mould, which may be bought for 50c., and a few yards of butter muslin are about the only extra needs in a well equipped farm house.

4. In a clean, airy room, with an even temperature, it is almost impossible to go wrong, and thus have a loss.

5. The demand is greatly on the increase and as soon as it becomes more universally known it will be extensive.

Detailed directions for the process of manufacture of these cream cheese are given in Bulletin No. 30, from the Dairy andCold Storage Branch, Ottawa. This bulletin can be had for the asking.

Buttermilk From Skimmilk.

W. S. of San Antonio, Tex., wishes to know the process of making buttermilk from skimmilk. The following paragraphs were written by Mr. John Michels, formerly Dairy Husbandman, for the North Carolina Experiment Station, and it will be noted that in order to make the skimmilk buttermilk of the same quality, as that made in the usual way, it is necessary to add some whole milk.

Souring the skimmilk.—As soon as the skimmilk leaves the separator, whole milk is added to it at the rate of one gallon to twenty gallons of skimmilk. This gives the mixture a fat content which approximates that of natural buttermilk. A large quantity of pure culture of lactic acid bacteria (starter) is next added and the temperature brought to 70 degrees F. Enough culture is added to curdle the skimmilk in about six hours at the temperature mentioned. When a temperature about 70 degrees is employed, there is a tendency for the skimmilk to "whey off" after it has curdled.

Churning—When thoroughly curdled, the skimmilk is placed in a churn and churned for forty minutes in the same way that cream is in making

butter. The churning process thoroughly breaks up the curd clots, resulting in a smooth, thick liquid which cannot be distinguished from ordinary good buttermilk.

Cooling—Immediately after the buttermilk leaves the churn, the temperature should be reduced below 50 degrees F. to prevent further development of acidity. Ordinary milk and cream coolers with enlarged holes in the distributing receptacle will answer very satisfactorily.

Straining and Bottling—After cooling, the buttermilk should be run through a strainer consisting of one thickness of cheese cloth to remove any unbroken curd clots. As soon as strained, the buttermilk is bottled or put in tin cans holding from one to five gallons, after which it is put into the refrigerator, where it should be held at a temperature of 40 degrees to 45 degrees F. until ready for delivery.

The Purpose of Butter.

If there is any kind of food that comes near to holding the importance of milk as a human food, that article is butter. Some people don't like butter, but they are too few in number to mention. Most of us find it difficult to get along without butter if compelled to do so, and when it is not on the table we feel that there is a big "something" lacking to make the meal complete.

The commonest food set on our table is bread and butter, and it is so common in fact, that we do not realize as we should its importance and value as a food. The greatest value of butter probably lies in its indirect value as a lubricator for the body. You may have never thought of it in that way before, but the writer feels that butter is one of the main necessities in maintaining a good healthy digestion. In fact, it seems as necessary to the human body as lubricating oil is to machinery. Of course too much butter can be eaten, with ill effects, but it is the same with any other food.

Many people sometimes "kick" on paying what they call high prices for butter, especially when the price goes up in the winter season of the year, and, of course, their objections may be legitimate if the quality is poor, but, considering the great care required in producing and keeping this delicate product, the highest market price set is not too high when the quality is the best. And particularly when people resort to buying oleomargarine, claiming that it is "cheaper," even the best quality of this latter product is high in price as compared with butter, when flavor and the difference between a natural product and an artificial product is considered.—Jersey Bulletin.

The Dairy Cow and the Hired Hand.

When the farmer is asked why he does not milk more cows, the answer almost invariably comes that hired help is too scarce, or that it is almost impossible to hire a man if he is expected to do the milking.

The hired man seems to have a hatred toward the dairy business. The question comes at once: "Why is this true?" Is milking harder than other work? I think that most hired men will agree that milking is not such hard work, but that the farmer figures on having the hand do a day's work in the field and then do the milking in the morning and evening besides, without any extra pay. Certainly if the dairy business is worth while, as I thoroughly believe that it is, the farmer should be willing to pay for the extra labor involved.

I have worked for several years as a hired hand on the farm and find that the work of milking the cows is not harder than other farm work, but that the tendency of the farmer is always to do the milking after a hard day's work has been done in the field. Often the milking was begun at five or earlier in the morning and in the evening when the milking was done, the milk separated, and the calves all fed, it was from eight to nine o'clock.

The demands of the hired man of today are not so much for higher wages as they are for shorter days. This is all right, and if the farmer will cut a few hours off the day's work in the field and use them in the dairy business he will make just as much money and enjoy life a great deal more. Cows, in order to do their best should be milked at equal intervals. If they are milked at five in the morning they should be milked at five in the evening. If this plan is followed I am sure that the hired man question will not be so difficult a one.

A hired man should be paid according to his ability and willingness to work. If he is a sluggard and still receives the same wages as the alert man, the man with higher ambition is discouraged because he does not receive pay in proportion to the amount of work he does. In many cases the farmer is condemning the hired man when the farmer himself is doing about all he can to discourage the man's ability.

Human interest and kindness are perhaps the best means of getting the most out of the hired man. If he is greeted in a cheerful way in the morning when he meets his boss at the barn and is treated as a man, he feels that there is something in this old world besides hard work and will feel more like trying to please his employer. On the other hand, If the man is greeted in a grouchy way in the morning or receives no greeting at all, he feels that the man for whom he is working is interested in him only so far as he wishes to get work out of him.

If some of the foregoing hints are carried out the dairy business will not be dreaded to so great an extent by the hired man and in the long run the farmer will be money ahead. The dairy business is certainly worth while. Why should not the farmer do his best to develop it on his farm? As land advances in value, dairy farming is sure to come, and the sooner the farmer gets onto the band wagon the better it will be for him.—G. E Frevert, Assistant Dairyman Idaho Experiment Station.

"PURE BRED"
SHARPLES
Tubular Cream Separators

Tubulars are "pure bred" because logically built on a principle absolutely different from all others.

No disks. Double skimming force. Wear a lifetime. Guaranteed forever.

Others, driven by Tubular superiority, attempt to imitate our low supply can or self oiling system, while being absolutely prevented by law from imitating the modern Tubular principle. "Cross bred" separators—nine parts old style and one part imitation—are being discarded.

LIVE STOCK.

Swine on Stubble.

On eastern farms the practice is quite common of turning outswine to glean in the grain fields after the grain has been reaped. In some localities this practice is or at least was quite universal. It was made easily possible by the fact that the fields were fenced. The swine thus given the liberty of the harvest fields made material gains, so material in some instances that a few weeks of fattening subsequently put them in fine condition for the market or for home consumption. The best gains were made by the swine when gleaning amid the pea or wheat stubbles. Grains that had long and stiff beards as barley and speltz were less suitable, and oats were encased in too large a proportion of hull.

In thase days, the after harvest season was looked forward to as the season when relatively quick gains would be made by the swine, who in those days were as a rule carried over the winter. The grain fields then formed only a part of the land that was devoted to crop production. Much of it was devoted to the growing of grass and some other products. On the farms of the northwest a very large proportion of the land is in grain, and yet the gleanings are in a great measure lost. If swine could have access to them after harvest, they would find enough grain in the fields to carry them almost to the point of being ready for shipment.

BOARS BOUGHT BY MAIL.

The question is sometimes asked as to whether it is advisable to purchase boars by mail order. Some people would assert for instance that sending an order by mail for a boar to any breeder is as near to the proverbial buying a pig in a poke as one could imagine. But it is not so. A professional breeder of repute has his reputation to keep up, and is pretty certain to send value for money, to induce you not only to deal with him in the future, but also to recommend him to others in want of stock. Only unreasonable buyers, who expect to get champion prize winners when they are paying a few dollars above the market price for pork, are likely to be dissatisned.

When ordering, write a clear description of the kind of animal you want, laying stress on the qualities your sows are deficient in. If your sows have not very good hams, for example, ask for a boar likely to remedy this defect in future progeny. A description of the kind you are looking for might be sent to several breeders till you get a satisfactory offer.

It is a good thing too, to get the boar several weeks before he is wanted for service, for the six or eight weeks' care and feed apparently wasted are really more than made up for in the increased efficiency of the boar.

Cots or House for Hogs.

This is a question with considerable room for personal opinion. Both have their advantages. It is true that the large house centralizes the work and makes it easier to the feeding, but there are so many other points in favor of the cot, that it appears to be best for this section of the country.

Let us notice a number of ways in which the hog cot is superior to the large house. We find that it is healthier, cheaper, easier to keep clean, better for the sow at farrowing time, and better for fighting hog cholera when it makes its appearance.

First. The large hog house is not as healthful, because experience shows it hard to keep in a clean and dry condition, a granitoid, brick or plank floor in a large hog house. Then, too when the one location is used year after year, it tends to become the lodging and breeding place for the bacteria that cause our fatal swine diseases. When the conditions around a cot become bad, the cot can be moved to a new site where it can have the advantage of all the sun and pure air.

Second. With regard to cost we find that the cot is very much cheaper. A very good cot can be built for $10 or $12. Now one can build a large number of these and still not be out as much as he would in case he built a large house. As the large house is used only a few months in the year, the money invested in it is idle too much of the time.

Third. It is easier to keep the sleeping quarters clean. If the cot is built on skids, we can hitch a team to it and drag it to a new spot when the old place becomes filthy. If the cot is built without a floor the labor of keeping things clean is lessened still more.

Fourth. As to the individual house being better for the sow at farrowing time, this is true because in the large hog house she is likely to be disturbed and made savage or restless by other hogs near by. Something may happen to excite or anger a sow in one part of the large house. She will give the signal of alarm or battle and immediately every sow in the house will jump up and see what the cause of the trouble is. Contrast this state of affairs with the conditions surrounding a sow in a cot and you will see the advantage of the latter.

Fifth. Last but not least, the advantage of this cot system when cholera breaks out in the herd. Suppose we have twenty sows, all sleeping in the same house. Every one is exposed to disease if one should happen to take it, whereas if the sows are separated into pens with three or four to each pen, the chances of wholesale infection is greatly reduced. Then, if it comes to the point where it is necessary to destroy a badly infected house, the expense will be far less where the cot system is used.

The objection may be raised that the cot will not be warm enough in the coldest weather for a sow and young pigs. Now if the cot is lined with common building paper or tar paper with an inner lining of rough boards to protect it and keep it in place we have a cot that will be warm enough in all but the severest weather. In that case a lantern hung from the room will generate enough heat to make the cot comfortable.

After considering all these advantages we must conclude that in most cases the cot system is by far the best for average conditions.—Missouri Agricultural College Farmer.

Fine Points of Sheep Raising.

When we came to this rocky farm, people said we would be unable to make a living. However, I find sheep as profitable stock as can be tried under such conditions. We bought a flock of sheep five years ago consisting of 18 ewes and two bucks, all of which were grades. I think a beginner can start with grades and make practically as much money as though he started with thoroughbreds and do so on a smaller investment.

For his grades he should secure a fine ram. In making a selection pick out one with broad hips and shoulders, and one that is not too leggy. As to breed, I prefer the Dorset as ewes will breed earlier in the season, and the early lamb is the one that brings the money. So far as shelter is concerned there are hundreds of old barns on Eastern farms thgt are just right for sheep, and yet, cows would freeze to death in them. The principal thing is to keep them dry and you will find they will stand almost any amount of cold. I prefer cool quarters for them as warm ones bring on colds and snuffles. A woven wire fence is desirable. Have it 3 feet high. It is a popular thing for farmers to say they cannot keep sheep on account of dogs. I believe if they would buy a good Scotch collie and train him properly, taking him right in among the sheep so they will get acquainted with him, there will be no trouble.

We figure on eight sheep to one cow or four sheep to a ton of hay. This is not timothy but is redtop, June grass and a small mixture of clover. If one has no second grade hay, he had better sell his choice and buy the poorer stuff as it seems to be just what the sheep want. Somehow they like to eat brakes that grow on rocky places, and I have known them to take such stuff in preference to good hay during the winter.—N. E. H.

Roots Good for Sheep.

One should aim to have a good supply of roots, such as turnips, mangels and small potatoes. I feed about a bushel of turnips daily to 28 sheep. I do not cut them. They are the common white egg variety. If turnips are too large sheep will bite off chunks. We also had a lot of cattle pumpkins which were frozen before they were fed, and when they thawed out a bit they were given to sheep, which seemed to relish them.

A Modern View of the Roofing Question

Tin makes a good roof *if you paint it.*

Canvas makes a good roof *if you paint it.*

Any felt makes a good roof *if you paint it.*

Even paper makes a good roof *if you paint it.*

But Amatite makes a good roof if you *DON'T* paint it.

On a painted roof, the paint is what gives the real protection. The rest of it has no function except to provide a smooth unbroken surface with no seams or cracks, to which the paint can be applied. Anything which has strength enough to keep the wind from blowing it away or the rain from beating it in, will be waterproof if you use paint enough.

Amatite Roofing, however, needs no painting. *It is a real roofing*—a roofing that can be left out in the rain without the slightest damage.

The wearing surface is mineral matter embedded into a heavy coating of pitch and never needs painting.

We shall be glad to send you a sample of Amatite free of charge if you will send a postal request for it to our nearest office. The sample will show you what the mineral surface is like.

Everjet Elastic Paint

A lustrous carbon black paint, very cheap, very durable—for protecting all kinds of metal and wood work.

Heaves of Three Years' Standing Completely Cured by

Fleming's Tonic Heave Remedy

So says Mr. H. B. Burkholder, Lillooet, B. C., writing about Fleming's Tonic Heave Remedy, and adds, "I also find it the best condition powder I ever used."

Heaves is not, as commonly supposed, a disease of lungs or air passages. It is due to stomach trouble, which, through the close nerve connection, causes a contraction of the lung tissues, and labored breathing.

Fleming's Tonic Heave Remedy corrects the stomach troubles, and tones up the whole system. Its cause gone, the heaving stops.

As a general condition powder, Fleming's Tonic Heave Remedy has few, if any, equals. Sent, postpaid, for $1.00 per package.

We believe this is the best book ever printed for free distribution. It covers over 100 Veterinary subjects, telling plainly how to recognize the various diseases and blemishes and how to cure them.

It is free for the asking—write us for a copy. 6

Fleming's Lump Jaw Cure—the first successful Lump Jaw Cure—today the standard treatment.

Fleming's Spavin Cure—(Liquid) cures soft and semi-solid blemishes without scarring.

Fleming's Fistula and Poll Evil Cure—enables anyone to readily cure cases considered incurable.

Fleming's Spavin and Ringbone Paste—one or two applications cure cases of years' standing.

If any one of Fleming's Remedies fails to cure we will refund your money—you to be the judge and your word to go.

Fleming Bros., Chemists, 41 Church Street, Toronto.

Animal Regulator

is just the tonic your horses and cattle need this winter—it will keep them in fine shape in spite of dry fodder and lack of exercise—will show you a handsome profit in the improved condition of your stock.

Pratts is a guaranteed grain saver (animals get every ounce of nourishment in the feed)—a sure preventive of serious illness because it keeps the bowels and digestive organs in perfect condition.

Mix a little *Pratts Animal Regulator* with the feed of all your live stock this winter, and you won't have to build them up next spring.

Satisfaction Guaranteed or Money Back

You don't risk a cent when you buy *Pratts Animal Regulator*. Every dealer is directed to promptly repay all dissatisfied customers the full amount of the purchase.

Get some Pratts Animal Regulator today. 25 lb. pail $3.50. Sold also in smaller packages and in 100 lb. bags.

Write for our FREE book on horses and cattle.

Pratts Poultry Regulator guarantees more eggs and prime holiday poultry.

Pratt Food Co of Canada, Ltd., Dept. 68 Toronto

For Diarrrhoea, Dysentary, Cholera, Cholera Morbus and all pains and cramps, children or adults there is nothing just as good as

Gates' Certain Check.

I aim to begin feeding grain a month before ewes are due to lamb. Thr grain mixture is two parts bran, two parts corn meal and one part ground oats. Of this we feed about one pint a day to each sheep. After the lamb is dropped increase the amount until each sheep is getting a quart daily. I have tried some years to get along without the grain, but find it much more profitable to use it. In this way the ewe has milk as soon as she lambs, and there will be no trouble about her owning it.

As soon as lambs are about a week old I have a trough where they can go and eat at any time and get some grain of the following mixture: Two parts bran, two parts corn meal, two parts ground oats and one part linseed meal. The old sheep cannot reach this trough. By feeding grain to both sheep and lambs I do not lose as many and get larger and better lambs that are ready for market sooner.

Before we fed grain we used to save 15 to 18 lambs from 25 ewes. Since graining, we have raised as high as 23 lambs from 24 ewes. Some of these are ready for market the first week in June. We dress and sell in local markets largely. This gives better returns and we have a demand for more than we can supply. In the real cold weather I have a box about 3 by 5 feet and high enough so sheep cannot jump out, and the ewe and lamb are placed in it as soon as lamb is dropped. By putting a blanket over the top it gets real warm inside. This is a good plan when a sheep is inclined not to own her lamb, as she is in such close quarters that the lamb has a good chance to get his meals, and after a day or two he will take care of himself.

A day or two after the sheep are sheared I find that the ticks get onto the lambs. I use a dip of tobacco stems with good results. You can get a common sack full for 25 cents, and half that amount is enough for 25 lambs. We steep it in water and when dipping sheep be careful not to get the stuff in their eyes or mouth.

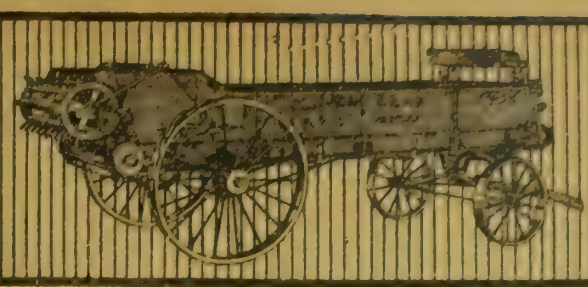
Our experience is that it pays to keep old ewes as long as their teeth are good. They make better mothers and are not inclined to be so wild, and I think they give more milk than yearlings or two-year-olds. I always aim to keep sheep tame so we can go among them without their running away.

A fair valuation for a flock of grade sheep would be $100. As for cost of keeping I figure on six tons hay at $10 a ton, which is $60, and $1 a head for the grain for both sheep and lambs, which would be a total of $85. The fertilizer is worth about all the labor that is required. There is always enough unsalable turnips in a piece to more than pay for the labor of raising them so you have this crop practically free.

My returns for 1910 were as follows: $130 for lambs sold, $20 for increase of flock, $23 for wool, making a total income of $173. The cost was $85, leaving net proceeds of $88. The wool last year was sold for the least I ever received. If there were more farmers in the business they would find a better market, as manufacturers do not like to bother with small lots. I can make $2 off sheep where I cannot make $1 from cows, and it is done with less labor and less investment.

Housing the Calves.

When all the live stock is brought in from the pastures, it is often found that the stable room is a little inadequate to accomodate comfortably all the animals. Very often this results in the calves being tied in small, dark corners here and there throughout the stable, where they receive very little attention, and where sanitary conditions are not well suited to the promotion of health and vigor in the stock. The housing of the calves is one of the most important phases of cattle-breeding. The calves compose the future breeding herd, and no breeder can afford to deprive them of anything which makes for their general health and rapid growth. Where possible, they should have box stalls to run in, where they can exercise at will. Plenty of light is essential, and good ventilation imperative. Each calf should have sufficient manger room; in fact, it is often advisable to have stanchions or chains arranged so that the calves can be tied during the feeding hour. This insures that each calf gets his allowance, and as no two calves will have the same appetite, the feeder is permitted to gauge the amount given to each to suit its condition, age and appetite. Where loose boxes are not available, the calves should be let out each day for exercise; in fact, this is often good practice, even where they are run in loose stalls. Do not crowd the calves into small, cramped, poorly-ventilated, dark stalls. The best stall in the stable is none too good for the future herd-header or the young heifers which are the making of the heaviest producers and the best breeders in the herd of a few years hence.



Don't Let The Soil Starve

YEAR after year, your crops take nitrogen, phosphoric acid, and potash out of the soil. These elements are absolutely necessary to the growth of plant life. What are you doing to replace them?

You can keep your soil from starving by spreading fresh manure, evenly, in proper quantities. Manure, spread in this way, puts back into the soil the very elements the crops have taken out. To spread manure evenly, you must use a manure spreader. When buying a spreader get a good one.

IHC Manure Spreaders

have proved their quality. Owners like I H C Spreaders because of their simplicity, strength, durability, and light draft. The superiority of these machines is due to the following constructive features:

The method of transmitting power from the wheels to the beater is simple and direct. There are no unnecessary parts to wear. The beater is large in diameter and the teeth are long, square, and chisel-pointed. By using this style of tooth, the manure is thoroughly pulverized and is thrown out before it wedges against the bars. This reduces the draft.

The apron is supported by steel rollers and the slats are placed close together, so that manure does not sift between. The steel wheels have ample strength to carry many times the weight they will ever be called upon to bear. Rims flanged inwardly, prevent cutting of meadows and accumulation of trash.

CORN KING and CLOVERLEAF

are machines that will merit your heartiest approval. They are made in many sizes, for field, orchard, and vineyard. Get complete catalogues and all information from the I H C local dealer, or, if you prefer, write nearest branch house.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhœa or Whitish Discharge, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to use the treatment a complete trial; and if you should wish to continue, it will cost you only about 13 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies in your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me** your address, and the free ten days treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

THE HORSE.

Looking Horses Over When Buying.

Horse selling is a shrewd trade. In a city or country the inexperienced purchaser is at the mercy of the professional seller. If the latter be at all unscrupulous, the chan ces are that the deal will be to the disadvantage of the buyer unless he knows a good deal about horses and how to examine them himself. And no casual examination will do. It must be made in detail and carefully done at that.

After taking a general look over the horse you are ready to examine him in detail. Begin with the head. Is the eye dull or weak, showing little animation? If so, be on your guard. A good eye is bright, intelligent and free from specksf By placing the hand over it for a few moments you will be able to detect its sensitiveness to light. Do you find any discharge of any kind from the eye? If so, some inflammation may be present. Try to ascertain the cause. A large, open nostril is desirable. Observe the color of the lining; to be just right and healthy looking, it should be of a bright, rose-pink color, and moist. A healthy nostril is free from sores, ulcers, pimples and any unpleasant odor. You must be on your guard at this point. An unscrupulous dealer can very easily remove discharges and odors by sponging and washing and you may be deceived. Always look in the mouth; you have the tongue, teeth, jaws and glands to observe. Naturally, you consider the teeth first; you want to be certain of the age. But give the tongue a second !f your time. If it is scarred and shows rough treatment, a harsh bit is likely the cause, due to its need in driving and handling. Enlarged glands may indicate some scrofulous or glanderous condition of the system, so a careful examination here will be worth while. A beautiful neck and throat is an absolute beauty in the horse. The skin should be thin, mellow and soft, and the hair not overthick or coarse. Look for poll evil at the top of the neck and head. See if swellings, lumps or hard places are to be found at the sides of the neck, or underneath joining the throat.

Passing to the side, look over the withers for galls or fistulae, the shoulders for tumors, collar puffs and swellings. Observe at the same time if there is any wasting of the muscles on the outside along the shoulder. Now the back. Is it right as to shape? Do you find any evidence of sores or tumors? Look fot these along the sides and belly. Now stoop a bit and look under; do you find anything different from what is natural? In males look for tumor or disease of the generative organs, and in case of geldings scrutinize carefully to see if they be ridgelings. Before leaving the body observe if the hips are equally developed, and the animal evenly balanced in this region. Both horses and cattle are liable to hip injury, one of the hips being frequently knocked down. Make sure that both are sound and natural.

Now step to the front again for a careful examination of the front legs and feet. Starting with the elbow, examine for capped elbow. Now the knee; it should be wide, long and deep, and at the same time free from any bony enlargements. The knees must stand strong too. Is the leg straight? Do you observe any tendency of the knee to lean forward out of line, showing or indicating a knee-sprung condition? Just below the knee, do you find any cuts, bunches or scars due to interference of the other foot in travel? Look here also for splints; follow along with the fingers to see if present, on the inside of the leg. Be particular about the cannon. The front should be smooth —you want no bunches or scars. Just above the fetlock feel for wind puffs; and note if about the fetlock and pastern joints there are any indications of e:ther ringbones, bunches or puffs. Now look for sidebones; if present, you will find them just at the top of the hoof. They may be on either side. Sidebones are objectionable and are the lateral cartilages changed into a bony structure. No defect is more serious than bone spavin. You can, as a rule, detect this by standing to the front of the horse just a little to the side.

In the region between the hock and the fetlock curb troubles are located. They appear at the lower part of the hock, directly behind. You can readily detect any enlargement if you will step back 5 or 6 feet. Lameness comes from many causes; maybe from soreness, from disease or from wounds. And lameness is hard to detect. Frequently it seems to be in the shoulder, when, in fact, it is a puncture in the foot. Again it may seem to be in the fetlock, but the trouble may be in the shoulder or fore leg. You must examine for lameness, both in the stable and out of the stable. If you find the horse standing squarely upon three feet and resting the fourth foot, you have a right to be suspicious. If you move the horse about and he assumes the same attitude again and still again, you can be certain that he is assuming that position because he wants to rest some part of that member.

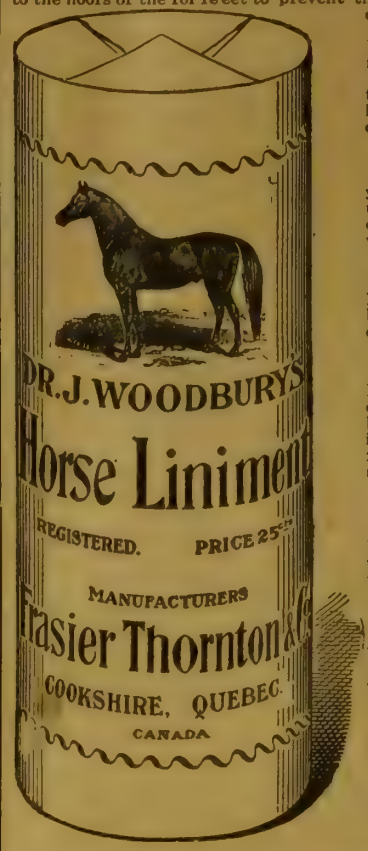
In testing out the horse for lameness, let no excitement prevail. Under such excitement the horse forgets his lameness or soreness for the time being, and you do not note the trouble. A quiet, slow walk or trot on as hard a road as possible is a desirable sost of examination to give. The free breathing of a horse may be interferred with, and for two reasons. Roaring or whirling, one of these troubles, is a serious disease. The second disease is heaves or bellows, and is also a most serious disease, because it also is incurable. By the use of drugs relief may be given temporarily, but no permenent cure follows. Unscrupulous dealers will resort to dosing lor the time being, or almost any other of the many tricks of the trade familiar to experienced horse traders until sale is made.—Charles W. Burkett.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For distemper, Strangles and colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. Woodbury's Horse Liniment to the hoofs of the for fe eet to prevent their becoming feverish, dry, brittle. hard, contracted or otherwise injured.



Insist on having Dr. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

DEAR SIRS—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumbermen should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

DEAR SIRS:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use Yours truly, C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper, and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right" 5817.
Elmsdale, N. S.

DEAR SIRS:—Kindly send me 6 dozen bottles Dr. J. Woodoury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE Co.,
Elmsdale, N. S.

DEAR SIRS:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

DEAR SIRS:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

Care of the Farm Horse.

The farm horse is an important factor in agricultural pursuits. We would npt get far without the patient quadruped who draws our loads and carries our burdens. He is so closely interwoven in our industrial and business life that were we called upon to adjust our farming operations to the use of some other motive power, our plans would be demoralized and our prosperity receive a serious check. In view, therefore, of the mportance of the place filled by the farm horse, it behooves us to care for him in a manner that will conserve his energy and enhance his usefulness.

The farm horse needs a stable, a comfortable stall in which to rest when the day's work is done. Don't put him in a dungeon, with no light or ventilation and expect him to be in good trim for the next day. Neither should he be compelled to stand under a leaky shed where the water drips through for tgree days after each shower. A good bed is as essential to the comfort of the horse as of the man. As to feed, the best is none too good, clean, bright hay, with oats that are not smutty nor dirty. Decide the quantity for yourself, but don't be stingy. A man who can't tell what amount of feed is required by a horse after he has worked him for a few weeks hasn't sense enough to farm anyway. All horses do not require the same amount of food any more than all men. Study your horse. Feed him enough to enable him to do his work. And pay some attention to his likes and dislikes if possible. He works for his keep alone and surely he is entitled to something better than a forkful of musty hay under his feet and a quart of screenings in a dirty feed box.

The horse at work should be well combed and brushed every morning, and a few strokes at night would not hurt him. If any of you enjoy going without washing your face and combing your hair possibly you would be consistent in letting your horse do without grooming.

The harness, too, should receive attention. There is neither humanity, economy nor common sense in having your horse's shoulders peeled and raw, his back sore, and his mouth torn with the bit. See that the collar fits the horse, better to buy a new collar than use one that does got fit. Then keep it clean and smooth. If the collar becomes coated wash it off at night with a rag and some warm water, and in the morning it will be clean and smooth collars fit and keep them clean you will seldom need a pad, and the horse collar, with the pull so adjusted that it will bear evenly on the shoulder, and keep in one position. A little attention to other parts of the harness will prevent galls, bruises, rubs and the like.

will have better shoulders and be more comfortable at work without a pad. The hames, too, should fit the

Kindness is appreciated by a horse as well as by a man. The owners of the world's famous race-horses will not allow a groom about the stables who swears at horses, neither will they permit harsh treatment of any kind. The farm horse may not be so finely bred as his brother of the turf, but he will respond to kindly treatment none the less.

From the standpoint of right the farm horse deserves kindness, care, and good feeling. It is his due. It

POULTRY.

Feeding Hens.

That the feeding of poultry is the most important factor of success in making the business profitable is no longer doubted by the majority of experienced poultry raisers. Yet, many of them still make this feeding question a complex one, mixed up with a conglomeration of formulas requiring a knowledge of chemisrty, organic and inorganic. They will tell you that hens must have a certain per cent of protein, fats, minerals, etc., and get all mixed up with a question which is so simple in all its details that a child can readily follow it.

In the beginning we will say that in feeding chickens one does not need to confine himself to any strict code of rules or any particular diet. We should be governed in a large way by the supply of feed at our command and also take into consideration whether our fowls have full range or are yarded. After a varied experience with dry mash feeding by the hopper method, we have discarded this method almost altogether for yarded fowls and are now using a method which seems to us simplicity itself and one that practically all farmers can easily follow because they have the feeds at their command. The feeds I refer to are oats, bran and milk. This feed is for laying hens. We feed the oats morning and night and the bran and milk in the form of a crumbly mash at noon. With the bran may be mixed 5 per cent of beef scraps, but as the milk itself is rich in protein, the beef scraps are not absolutely necessary. Oats, bran and milk will produce not only plenty of eggs, but strong, fertile eggs. However, the oats to be used should be of the best quality and should be full weight or above. We do not raise much good oats in this section, so I buy northern oats, which runs from 38 to 40 pounds to the measured bushel. Hens will eat other fattening foods such as corn in preference to eating oats, so it is often necessary to force foods.

Farmers should not be slow in taking advantage of the feeding value of grains for poultry to realize the greatest profit. They should feed corn only when they want to fatten for market. Oats is a much cheaper feed than corn and is productive of far greater results in egg production when fed in conjunction with bran and milk. If you want to use some hens for table use put them up for eight or ten days and feed corn, which as all farmers know, is a fattening feed and should be used only for such a purpose.

In cold weather and before eggs are used for incubation, hens may be fed corn once a day, at night, but we consider even that not essential. Feed good heavy oats and if fowls have range keep a box of bran before them and feed milk in clean vessels. If yarded feed heavy oats in litter during the winter, and onthe ground or spaded into loose soil in summer and mix bran with milk and feed all they will eat once a day. Fowls in addition to this should have green stuff, such as sprouted oats, cabbage or lawn grass, weeds or anything of a water. We have fed a good deal of succulent nature, also grit and pure mixed grain feed in the form of scratch feed, but have about discarded this feed, as it contains a large amount of corn and other grains that have a tendency to fatten. Such feeds as these have their uses and may be fed to growing stock and pullets up to the laying age.

While we believe that oats, bran and milk will produce more eggs than any other combination of feeds, we are doubly sure that this feed will produce the eggs at one-half the cost of most feeds. The farmer produces his own milk and in most cases raises his own oats, as well as wheat from which bran can be had. Wheat is also a very good feed, but far too expensive and not nearly so good as heavy oats. Corn, while a cheap feed for the purpose of fattening, is a dear one, indeed, for producing eggs. The amount to feed depends on the breed of fowls kept and whether yarded or on full range.

Having tried quite a number of breeds we find Houdans consume much less feed than any other variety we have tried. Having at present Houdans and Orpingtons, we find that Houdans consume less than one-half the feed of Orpingtons in many cases and at the same time Houdans produce more eggs. Why is this so?

The editor of this paper knows we are partial to Houdans and no doubt he, as well as many Guide readers, would like to know our reasons for the above assertion. Like our method of feeding for eggs, the reason seems very simple to us. Farmers generally, know that some kinds of stock are more easily fattened than others, some breeds of cattle and hogs more easily convert what they eat into fat and tissue while others keep poor and thin on the best of care, yet as a general rule make good breeders. We believe this also applies to fowls.

Take the larger breeds, Orpingtons, for instance, they take on fat easily; they consume a large amount of feed and while they are good layers they eat far more than is required for the purpose of egg production and the surplus goes largely to fat. On the other hand, Houdans, a medium sized breed, are moderate eaters and by actual test eat one-half the amount required by Orpingtons, but do not fatten easily. They remain thin and the most they eat goes to eggs.

At the present time we are experimenting along this line. We are feeding our Houdans and Orpingtons on exactly the same ration as given in this article except we feed the Orpingtons about twice the amount that we do the Houdans. We have been making this comparative test for about two months, partly to give a trial test to this method of feeding oats, bran and milk and also to test the comparative laying qualities of these two breeds or rather four breeds, as we have three varieties of Orpingtons. We have found under this test that Houdans lay more than twice as many eggs as the Orpingtons. However, many of the Orpingtons are broody and Houdans being non-sitters, have a little advantage in this respect. Now we are feeding the Houdans all they will eat, but not the Orpingtons, and although the latter get twice the feed, still they are not satisfied. As one of my customers said in a recent letter: "Houdans are very small eaters and do not eat over one-third the amount of other large breeds," and yet they lay more eggs.

Now it is not our attention to boom a breed in this article, but merely to give our method of feeding for eggs, and in saying what we have about these particular breeds we keep, we have given the facts brought out by comparative tests. We want all farmers to test this method of feeding and cut out all corn feed for laying hens. It is needless waste to feed corn to hens unless you want to sell them on the market. Especially to yarded fowls, feed heavy oats, bran and ilk. —The Farmers' Guide.

FEATHERS WANTED.

Broody Hens and How to Cure Them.

Broodiness after the hatching season is too often in excess of requirements, and the poultry keeper who has an eye to economy as a means of making profit is anxious to cure his hens of broodiness as rapidly as possible, so that they can be brought on to lay again.

Broody hens, if taken in hand and treated on showing the first symptoms, can be cured with far less trouble and more expeditiously than if they be allowed to take to the nest and sit. Symptoms are often detected by the hen clucking a little, and crying out if disturbed unduly when on the nest. Her eggs, too, become small. Such a hen should be taken away from the others and be confined in a pen alone, where she can not form a nest. After being confined there for a few days, she must not be allowed out, else she again betakes herself to her old nest and the broodiness goes on. Some hens become broody which will never make good sitters, and on the first appraach of anything unusual they fly off the nest making a great noise. Such hens are generally of the non-sitting breeds, and become broody only through the bad example of others. These hens, too, will keep up this so-called broodiness for weeks if not dealt with. If captured at once and put under control, the fit soon passes off and laying is shortly after resumed.

The pen for brood hens is of special construction; the floor is of wooden bars devoid of bedding. Many hens will sit anywhere, even in the roadway, and if put into an ordinary pen by themselves they will proceed to make a nest in the corner and sit here for several days with or without eggs. Such hens can be dealt with successfully only in a special pen for "putting off." Food and water are then supplied in abundance. A mistake, too often made, is to keep broody hens without food, and that for a lengthened period, whereas hens well fed in such a condition will come out none the worse for incarceration, and will at once begin laying regularly when the broodiness passes off.

Various other methods are often adopted of putting hens off when broody. Tethering them by a rope by the leg is objectionable, as the limb may get dislocated in the hen's struggles to get free. Then, again, another practice is, in some districts, believed to be an effective cure, namely, dipping the broody hens bodily in cold water. This treatment, although not at the time apparent, proves fatal to the fowls, and tends to bring on rheumatic troubles or to cause inflammation of the lungs.

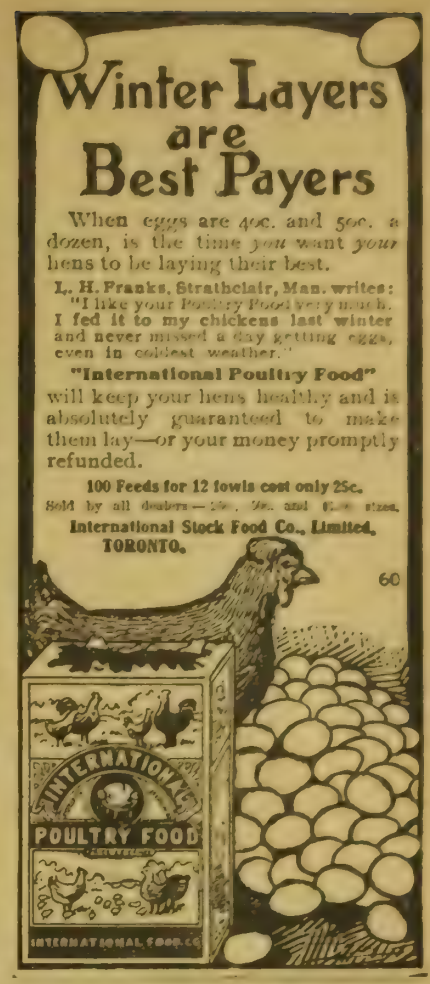
The only satisfactory way is to confine them under such conditions as will make it impossible for them to settle down comfortably. There they must be kept till the symptoms of broodiness have entirely passed off, when they can be let out again with the ohers. Laying will then commenee again in the course of two or three weeks, if not earlier.—S. W.

Finishing Fowls For Market.

A gain of 25 to 50 cents per head can frequently be made by two or three weeks' judicious feeding. The easiest method is to shut the fowls in a small pen and feed them all they will eat three times a day. They should not be fed anything for the first 24 hours after confinement, and then lightly for two or three days until they become thoroughly accustomed to it and get onto their feed.

A ration which has proved very successful with New England feeders is composed of about three parts yellow corn meal and three-fourths part of red dog flour, mixed with boiled pumpkins and milk. The pumpkins help to give the yellow skin, so much desired in American markets, but it generally takes from four to six weeks to get much benefit from them. As fowls will hardly stand the forced feeding for this length of time, pumpkins can be added to their ration for a few weeks belore they are taken up

Mix the feed rather soft and put it in V-shaped troughs and throw out any feed that may be left. It is a mistake to keep feed before them all the time. If the fowls have been running on free range and have had a hard grain diet they may not take readily to this feed if it is given them as soon as they are confined. But withholding all feed for 24 hours will make them hungry enough to take hold at once.



Winter Layers are Best Payers
When eggs are 40c. and 50c. a dozen, is the time you want your hens to be laying their best.
L. H. Franks, Strathclair, Man. writes: "I like your Poultry Food very much. I fed it to my chickens last winter and never missed a day getting eggs, even in coldest weather."
"International Poultry Food"
will keep your hens healthy and is absolutely guaranteed to make them lay—or your money promptly refunded.

Early Perching.

Chickens should not be allowed to perch until they are at least fourteen to sixteen weeks old. A large proportion of the chickens offered for sale in shops have their value very considerably reduced by reason of their breastbones being bent. In ninety-nine cases out of a hundred this is due to their having been allowed to roost upon a narrow perch when too young. Until a chicken is several months old its breast merely consists of gristle and if this comes into contact night after night with a hard, narrow perch, the weight of the body resting thereupon, it is bound to be put out of shape. The chickens should sleep upon the ground on clean straw, dried leaves or peat-moss litter. Should there be a fear of dampness or a danger from rats, a shelf 1 inches or 4 inches wide should be provided raised a foot or so from the ground.

Shrinkage in Weight of Eggs.

There is considerable shrinkage in the weight of eggs as they become stale. When laid, tne air space in the end of the egg is scarcely visible; but as evaporation sets in the contents of the shel, shrink, and the space increases. Edward Brown, F.L. S., the leading poultry expert in Great Britain, has had observations made on tne evaporation of eggs. These were made during cool weather, yet they show that out of 120 eggs one egg contents disappeared in six days, two in 13 days, three in 21 days, four in 29 days, five in 36 days, six in 47 days and seven in 60 days.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Be a Booster.

Il you see some feller tryin'
For to make some project go
You can boost it up a trifle;
That's your cue to let him know
That you're not a-goin' to knock it,
Just because it ain't your "shout,"
But you're goin' to boost a little,
'Cause he's got the "best thing out"

If you know some feller's failin's
Just forget 'em; 'cause you know
That same feller's got some good points,
Them's the ones you want to show;
"Cast your loaves out on the waters,
They'll come back" is a saying true;
Mebbe they'll come back "buttered,"
When some feller boosts for you.—Exchange.

Love's Barrier.

(Continued from last issue).

CHAPTER XI.

SUNDAY MORNING.

Secretan left the church after early celebration, and took the path through the sparse yews to the Rectory garden. It was a bitterly cold morning; a few thin flakes of snow were filtering through the soundless air. He turned up the collar of his coat and walked sharply, trying to restore the warmth he had lost in the cold church. The atmosphere had been almost intolerable, through Isaac Howorth's sheer inability to grasp the fundamental principle of the new heating apparatus, which Mr. Hayes at his own expense had lately installed. The thought of a cheerful fire and a warm breakfast allured Secretan, as he made haste to the house. There had been an unusually large number of communicants, and he had been detained after the service conferring with the verger about the furnace, so that now it was close on nine o'clock. If any had attended in the hope of seeing the Rector's new wife they had been disappointed. Miss Jane had never missed the early service. Summer and winter her quiet kneeling figure had been in its accustomed place. To-day they were doubly bereft, for the Court Farm was far away, and she was not now mistress of her own time. Through the bare boughs of the wintry trees, the curious-eyed women could discern that the blinds at the window of the Rector's room were not yet drawn up.

"Il the new wife's to be a lie-abed, Ann," observed Lydia Rash, as she drew her skinny rabbit fur more closely about her neck, "ut'll be a bad thing fur th' parish."

Gie th' puir thing a chance, Lyddy. It's 'er furst mornin'. Shoo'll turn oot a'a reet by-and-by, nivver fear."

Secretan passed eagerly into the house, where he had been accustomed to find his every material want ministered to, even anticipated. Sunday had ever been Jane's busiest, most important day. She had been in the habit of rising at six o'clock, and setting the household machinery going before she went out. In winter mornings it had been her own particular care to see that the fire burned strong and clear in the study, and Hannah always got the breakfast forward, so that a few moments' sufficed for Jane herself to put the finishing touches on her return. Secretan found Hannah struggling with damp wood and a smoky chimney in the study, and the dust lying thick on his desk, which she had forgotten to cover up with the dust-sheet. The dining-room fire had decided to kindle, but there was no sign of breakfast; anh everywhere there was discomfort and a cold atmosphere. The expression of Hannah's face was helpless, even sullen. She had never been accustomed to think or act for herself; she was now like a rudderless boat on a strange sea. Secretan was conscious of a sharp dismay. He hung up his coat and hat, and after a moment's hesitation, ascended the stairs. But the bedroom door was locked.

"Coming, dear, called Helen's voice, "I am just ready."

"Hannah wants some seeing to," he suggested through the closed door. "We are supposed to breakfast at nine punctually."

He heard Helen laugh, and after a moment she opened the door, looking perfectly radiant from her cold bath.

"Oh, how cold you look, Claude! Surely it can't be necessary to begin the day so early in winter. I must see whether I can't alter that. I'm sorry I was late, but I fell asleep after you went down, and the bell awakened me. What a sepulchral note it has! I take nearly an hour to dress, but I'm coming now."

She patted his arm, smiled upon him, and his quickly raised ire melted like a cloud before the sun.

She passed him by at a run, discerning in his eye the desire to kiss her, and in a few moments she had Hannah under weigh, and created order out of chaos, comfort out of the raw material lying to her hand. She shut the windows and the doors, coaxed the chimney to a better frame of mind, and finally descended to the kitchen to see what was to be had to eat.

Her quickness was incredible. By a quarter-past nine the hot meal was on the table, and Helen, a little breathless, her cheeks rosy, and her eyes sparkling, had summoned him to eat.

"I feel convicted like a hireling that hasn't risen to the bond," she said demurely. "Wait till next Sunday! It shan't come in very cold and very cross, and find nothing to eat."

Secretan laughed, and with adoration in his eyes, drew his chair a little further up the table to be near her.

"No, sir," she called out, shaking a warning finger at him. "Don't destroy the symmetry of things. That's your way, walk ye in it!"

He laughed back and disobeyed.

"I had forty-three communicants this morning; Isaac counted them. Mostly women—come to see you."

"It did them good to be disappointed, then, if they came from such a mundane motive," she answered soberly. "When is the next service?"

"Eleven o'clock."

"Well, I think I'll go for a walk across the moor. I've been longing to ever since I came, and it's a nice crisp morning. It will do me good."

"If you will come to the service, I'll take you as far as the Grey Tor before dinner, dear," said Secretan, with a furtive anxiety in his eye.

She shook her head, poising a morsel of fish on the end of her fork.

"I don't want to go, dear. I told you I was not keen on churches. I haven't been in one since we were in Paris, and then I only crept to matins at a little chapel in the Rue d'Essau, where the priest had the loveliest face, and a way of saying 'My daughter,' which made one feel that there was no sorrow he couldn't heal."

Secretan gave her a little startled look.

"You mean a Roman Catholic chapel, do you?"

"Yes, of course. I shouldn't mind belonging to that communion. It gives one so little to do."

"That's where you are quite mistaken," he said, a little coldly, for his faith was precious to him, and her careless, flippant words wounded him in his dearest part. "It is ordered to allure the unwary. Once they are inside the net they discover that it is a net, that they have precious little liberty of conscience or action."

"Why, how bitterly you talk! Where is your Christian tolerance, Claude?" she asked amusedly.

"I don't like to hear you speak like that, Helen. I hope you won't to anybody but me."

"Oh, I must have my liberty since I'm not inside any net," she said with a mischievous glance. "How many services are there?"

"Four every Sunday, and once a month I have to go down to the Midcar Union at Longleat to take the service for the inmates."

"You do work hard, and I shall be deserted on Sunday."

"No, for you are going to share my work, I hope," he said a little quickly. "You will go out at eleven this morning? They—they will expect it."

"I can't help that," she answered calmly. "Why should I go to a service in which I have no interest, in which I am not even sure that I believe, because they want it? I would very much rather go for a walk on the moor."

"It—it will occasion remark, Helen. Go this one day, just to please me, and I promise you I shan't insist afterwards, if you find it intolerable."

She did not make any answer for a few moments.

"I warned you, Claude, did I not, that I should not be a proper clergyman's wife."

"I did not take you seriously, Helen, and you must see that this means a great deal to me. Only this one morning!" he pleaded more earnestly when she gave him no answer. "And I promise that if you find it intolerable you shall not be asked again."

"Will Jane come in to church today?" she asked after a moment, in which she appeared to ponder the thing in her mind.

"Most likely. Courtney hasn't been a church-goer of late, but unless she finds her duties more absorbing than she expects, she will certainly be there."

Then we shall have her to dinner afterwards, shan't we?"

"That is for you to say," he answered.

"Then, of course, we shall have her. Claude, you won't mind if I transplant Bates from Colchester, will you? Hannah seems to want some help, and her hands are very red, and her feet very heavy, when she is clearing at meals. I taught Jimmy myself, and he is a dear little chap. I promised to think of it, and as his mind is made up not to stay with Mrs. Revell, we may as well have the benefit of his services."

"You must manage the house as seems good in your sight, dear," answered Secretan, a trifle dully, for she had not yet satisfied him regarding the eleven o'clock service.

"Of course, I shouldn't expect you to pay him! His salary is not very princely, only four shillings a week and his uniform. But I shall charge myself with it, as I am bringing him primarily for my own use and benefit."

Secretan laughed.

"The income will be all yours, to

You

will like the fine flavor of Red Rose Tea. It has the cup goodness that comes only from Red Rose quality—the reason why it holds first place in thousands of Canadian homes. Will you try it.

RED ROSE TEA "is good tea"

THE BEST REMEDY

For Women—Lydia E. Pinkham's Vegetable Compound

Belleville, Ont.—"I was so weak and worn out from a female weakness that I concluded to try Lydia E. Pinkham's Vegetable Compound. I took several bottles of it, and I gained strength so rapidly that it seemed to make a new woman of me. I can do as good a day's work as I ever did. I sincerely bless the day that I made up my mind to take your medicine for female weakness, and I am exceedingly grateful to you for your kind letters, as I certainly profited by them. I give you permission to publish this any time you wish."—Mrs. ALBERT WICKETT, Belleville, Ontario, Canada.

Women everywhere should remember that there is no other remedy known to medicine that will cure female weakness and so successfully carry women through the Change of Life as Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs.

For 30 years it has been curing women from the worst forms of female ills—inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, and nervous prostration.

If you want special advice write for it to Mrs. Pinkham, Lynn, Mass. It is free and always helpful.

HORN SOLID GOLD WATCH PUZZLE

GREAT OFFER BY A RESPONSIBLE FIRM. IT COSTS YOU NOTHING TO TRY.

To any person who can supply the correct names of these two well-known Canadian **Towns**, and fulfils conditions below, we offer our 15-Dollar Lady's **SOLID GOLD WATCH**, fully jewelled. Stamped, as a **FREE GIFT.** (**Silver Watches** are presented to Gents.)

Send your attempt, together with stamped addressed envelope for reply to FELLOWS & Co., Wholesale Watch Merchants, 79 Adelaide St. East, Toronto. The winner is required to purchase a Chain from us to wear with watch. The name of this paper must be mentioned. Prize-winners of last competition were:—

Mr. Lawrence Fisher, Union St., Waterloo, Ont.
Mr. J. Ferguson, 52 Marquette St., Sherbrooke, Que.

Send Us Only $1.00

Receive by return mail post paid two beautiful little dresses like cut in soft warm dress goods in dark red plaid patterns for little girls age 2 to 8, made with waist and skirt trimmed with braid in latest style. Age 10 to 12, 75c. Age 14 $1.25, add 14c for postage. **Standard Garment Co., 16 Standard Building, London, Canada.**

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

lay out as you will. I only want a few shillings occasionally for books, and I should not presume to interfere with any of your domestic plans. Jane will tell you I never have done that."

"Admirable person!" said Helen with a little move. "I begin to think I have secured the only model husband extant."

"But he will want his own way in a few little things," he suggested anxiously. "The service, for instance. You will go, won't you? It's a matter of moment to you."

She shook her head.

"Not to-day, dear. I really don't feel like it. Now, won't you have any more? What can I do for you? Let me go and see whether the study fire is behaving itself; and don't look so glum. Jane will uphold the credit of the family, and I am sure you will preach all the better if the disturbing element is not in the church—to say nothing of your hearers, who would only be able to give you a divided attention. I won't be pilloried to-day, thank you. Some day, when I get to know the people, I may drop in."

She spoke with such complete decision that Secretan was made aware that it was final. He was bitterly chagrined, however; but realising that it would be unseemly and unwise to wrangle over the matter, which, though important to him, was very small in her eyes, he said no more. He was also quite well aware—and the certainty gave him a curous pang—that it was his self-esteem and his pride that were hurt more than his actual spiritual sense. He had all an Englishman's horror and shrinking from the unusual, and he knew that the whole of Midcar would turn out to see the new wife, and expect to behold her in her proper place. If she would only consent to appear there to satisfy the conventional ideas, the somewhat unusual circumstances of his marriage would be forgotten. But Helen would not be coerced. Her frank, clear eyes had neither doubt, shrinking, nor indecision in them. She would be a law to herself.

She left him the study to address himself as best he could to his sermon, and retired to her household duties, to the capture and subjugation of Hannah, who, bereft of her shield and buckler, was in a limp and decidedly unpromising state.

Helen undoubtedly had the housekeeping sense developed to an extraordinary degree. She was absolutely mistress of the small and overwhelming detail necessary to the successful management even of a small house, and she despised nothing. Helping Hannah to clear the table, she gently suggested rather by her manner and example than her speech, that there was a right and a wrong way of doing things. And she was so gentle and considerate that Hannah found herself melting in spite of herself.

"Now, Hannah, I want you to go to the service this morning. I'll see to things. You have been in the habit of going, haven't you?"

"Oh, yus, ma'am, ivvery Soonday marnin'. Miss Jane, shoo wur varry partickler. Ivverything's getten ready, and whenivver I cooms in, A'a pops on th' petaters——"

"Well, I want things to go on like that. Come now, and I'll help you with the beds before you wash up."

They worked very amicably together for the next hour, and by half-past ten Hannah had retired as usual to her own room, to get into her Sunday best. She had no doubt that her mistress was engaged in the like manner.

But Helen merely threw herself into the old arm chair in the dining-room and opened a book. The bells were now ringing a more alert and joyous peal, a little jangled it is true, offending Helen's musical ear; but the sound was pleasant enough,

and suggestive of country ways. Her book had fallen, and she was leaning back looking vaguely into space, when Secretan sought her. She jumped up.

"Are you going, dear? Can I brush your coat or do anything for you? I've had quite a busy morning, and you will be glad to hear that Hannah is nearly ready."

He came in and shut the door.

"You really won't go, then, dear?"

She looked surprised.

"Not to-day. You'll find me here when you come back. I hope you will have a nice service, and that the people will appreciate it."

Secretan went out rather quickly and closed the door. His temper was of the fiery order, and he thought Helen was not treating him fairly. She smiled a little, comprehending him perfectly, and liking him none the less for it. She had not expected the perfect man, and she was, on the whole, rather glad than otherwise to find him so very human. She let him go, and presently from her bedroom window watched his tall figure wending its way between the yew trees towards the church.

By this time all the approaches to the church were thronged, and the sound of wheels as the different vehicles of the country people began to arrive, filled the air. Just on the stroke of eleven a very smart carriage with a pair of magnificent bay horses drove up, and Mr. Hayes got out. Conscious of a quickened interest she watched for the descent of his women-folk. Dismissing the stout, commonplace, expensively dressed mistress of High Ridges at a glance, her eyes were riveted by the exquisite beauty of Audrey's face. The simplicity of her dress set off the lissom, girlish lines of her figure, and the sweet joyousness of her looks, the perfect purity seemed to Helen exquisite. She wondered how such plain people could have become parents of so fine a creature.

Behind them, having alighted from a high dog-cart in which a bony horse of sixteen hands was with difficulty restrained, came Jane, leading two little boys in sailor suits by the hand. She saw them exchange greetings with the Hayes at the church porch, which presently swallowed them. Helen wondered whether Jane would be disappointed. Well, she had promised her nothing except that she would do her best. The best, as yet, did not include sitting through a service in which she had no interest, and in which she did not believe. But it might be included by and by. She could easily imagine herself being influenced by Jane.

When the bell had rung itself out and the doors were closed and the first notes of the organ came stealing out upon the soundless air, Helen hastily put on her hat and jacket, drew a pair of loose gloves on her hands, and taking a stick from the hall stand, slipped out and locked the door.

The moor beckoned her, with the grey mist lying heavily upon it, its sombre colouring so representative of the web of life. It was a strange desolate region to which she had come, and as she stood a moment on the edge of the moorland road looking down the steep slope towards the valley, where the smoke of factory towns partially obscured the vista, she wondered what the end would be. Last Sunday she was a free woman, though not a happy one. Was she happier to-day? she wondered, and could find no answer to the question. Seeking a greater freedom, she had bound herself anew; that was her inwatd and insistent conviction. She stepped across the ever-widening spaces and felt her foot sink in the moss and the heather, while the cool wind, unhindered in its course, played upon her cheek. She came presently to a little dell where the streams dipped and fell into a deep pool, about which the boulders stood like sentinels. There was great growth of underbush in that sheltered spot, and she could imagine it a delightful spot in the heat of summer, when one could throw oneself on the bank under shade of the bending trees and forget the world which lay outside. It was cool and desolate now, but the place seemed to have a sort of spell over her, for she came back again a few steps after she had passed on, to look back once more.

It was made for a trysting place, surely; and she had no doubt that Midcar lovers had long since made it their own. The walk did her good, the wideness of the prospect, the cool clear of the air, the bending skies so near, and yet so far, seemed to enter into her being and give a sense of largeness and peace. Here, surely, there was room to live away from the sordid and petty tragedy of things. People who lived near these solitudes, within call of the wild, must, of necessity, be a simpler, kindlier, purer folk.

Although Helen did not profess to be a religious woman, she had a reverent mind, and it was in a very soft, pliant mood she returned to her home, trying to choose the moment opportunely, so as not to encounter any of the church-going folk. She succeeded only partially. The flock of she was, and surprised that she little groups. They stood still gaping at her curiously, knowing who had scattered, and at the edge of the moor she had to pass by several should be wandering on the moor,

Buy an IHC Cream Harvester Instead of Another Cow

FIGURE up the profit per year and the total profit your average cow pays during her lifetime. Then get the facts about the profits an I H C Cream Harvester makes—in extra butter-fat, in extra hog-profits from skim milk, in work and time saved, and in the many other ways, all shown in our catalogues. It won't take you long to see how you could profitably buy an I H C Cream Harvester instead of another cow. The total profits paid by an I H C Cream Harvester will amount to much more.

Keeping cows without a separator is like harvesting wheat without a binder. But you must be careful what you buy. If you want to be sure of getting the closest skimming, easiest turning, and easiest cleaning separator made—choose one in the I H C line—

Dairymaid and Bluebell

These are the only separators with dust-proof and milk-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. These separators have large shafts, bushings, and bearings; the flexible top-bearing is the strongest and most effective found in any separator. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated. I H C Cream Harvesters are made in two styles—Dairymaid, chain drive; and Bluebell, gear drive—each in four sizes—to meet every condition and the need of every farmer. Whichever I H C you select, it will make more money for you per year, and will last longer than any other separator you could buy. The I H C trade mark should be your guide in buying a cream separator. The I H C local dealer will be glad to point out the above features and many others, or, write nearest branch house for catalogues and other information you desire.

IHC Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.

Cooks on top of the stove, bakes in oven at same time

You can cook over every pot-hole and bake in Pandora oven at same time—and get perfect results. That's because cooking draft is also baking draft. Flues are so constructed that heat passes directly under every pot-hole and around oven twice before passing up chimney. No wasted heat—instead fuel does double duty, saving Pandora owners both time and money. 19

Would you not like to be a Pandora owner?

McClary's Pandora Range

instead of being in the parson's pew. Some of the men awkwardly touched their hats, and when she smiled upon them they looked at one another sheepishly, aware that they had not seen anything so sweet in Midcar for many a day.

When she got within the Rectory grounds she heard the shrill voices of children, and presently saw the two little boys playing with the old spaniel who had been about the Rectory for many years. When they saw her they hung back a little; but she stretched out her hands, and when they ran to her she knelt down and folded an arm round each. Secretan and Jane, looking out over the study blind, gravely discussing her action of the morning, saw that her eyes were full of tears.

(Continued in next issue).

Household Hints.

To renew the elasticity of rubber rings that have become hardened, soak five to thirty minutes in ane part ammonia and two parts water.

In cleansing oil stoves use a small whisk broom. It removes dust and dirt from corners and saves the hands.

Nut butter is a pretty good substitute for meat now that the latter brings such high prices. Run walnuts or shellbarks through a food-chopper, and rub into them about one-third as much good fresh butter. Spread on crackers or bread.

Our housekeeper puts a little vanilla in griddle cakes, waffles, fritters and muffins.

An alarm clock in the kitchen is useful to warn the cook of needed attention to roast, cake, etc.

Why fill the gouse with the odor of burning fat and watch it carefully for hours to prevent it burning, when frying out lard? Use a double boiler (two kettles in the wash-boiler will do very well for large quantities); place it on the back of the stove and the lard will come out snow-white with no watching at all.

Ink which stands some time is liable to grow thick in the bottom of the bottle and clog the pen. Strain the ink through a thin cloth, remove the thick part and thoroughly wash the bottle before putting the ink back.

Sour cream makes a first-rate salad dressing. Stir together salt, mustard and pepper with lemon juice and beat in the sour cream, pouring it over the salad at the moment of sending to table.

Some Good Shorthorns.

Walter E. Eaton, Upper Canard, N. S., writes:

"The enquiries for Shorthorns are coming in now for the fall trade, and I have just sold three splendid young bulls to Malagash Agricultural Society, Lunnenburg Co., N. S., also a grand heifer to C. C. H. Eaton for New Brunswick parties and a young cow for himself. Among the bulls on hand now are some of the best I ever offered for sale.

'Five P's.

There is a five pointed star that will lead us to success. On its points are push, patience, pluck perseverance and prudence. These are just as necessary in the home as in the business world.

Analyzing Fertilizers.

Robert Gamblin, Victoria Co., N. B.—Where can I send a gample of fertilizer to be analyzed? Please send me full particulars.

Ans.—Any purchaser of a registered fertilizer may obtain from the Minister of Inland Revenue an analysis of the fertilizer as delivered to him on payment of a fee of one dollar, and making application for such analysis accompanied by a sample of the fertilizer of at least one pound weight, and taken in accordance with the following directions:

Samples of fertilizer submitted by a purchaser for analysis must be inclosed in glass jars or bottles, and properly sealed. The sample must be taken in the presence ol the vendor or of his representative. In lots of five tons, or less, portions shall be drawn from each separate package, and from at least ten packages; or if less than ten packages are present all should be sampled. In lots of over five tons, at least ten per cent of the packages shall be sampled. The portions so taken shall be thoroughly mixed in the presence of the parties interested, and from this mixture the sample sent to the Minister is to be taken; and must bear the signature of vendor and purchaser; and at the same time a duplicate sample is to be left with the party whose goods are inspected, subject to the call of the manufacturer or agent.

Address the sample, fee, and application to the Deputy Minister, Inland Revenue, Ottawa.

Have You Ripe Clean Timothy Hay?

Editor Maritime Farmer:—

We take the liberty of writing you for information regarding the Hay crop in the Maritime Provinces. We heard that it has been a good crop. You are probably aware that Timothy seed is scarce this year, as it was last year. We have been informed that considerable of the hay in parts of the provinces could not be cut until quite late, on account of the wet weather. Because of the lateness of the cutting we are under the impression that considerable of it could be threshed easily, if the farmers know about it and are so disposed. We thought perhaps you, with your intimate knowledge of the country, might know where such Timothy is grown and the chances for having it threshed. If you care to give us any information on this matter, we shall appreciate it very much. A prompt reply will greatly oblige.—George Keith & Sons, Toronto, Ont.

Editor's Note:—For the information of any of our readers who may have a crop of Timothy hay suitable for threshing for seed we are publishing the foregoing letter and would advise all those who are interested to communicate with Messrs. Keith.

The In-Calf Cow.

Ice-cold or impure water and improper grain and roughage are detrimentals that must be avoided in handling the pregnant cow. Never allow her to drink ice-cold water, as it has a most deteriorating effect on her whole system, and, while it is very liable to cause abortion, it cannot fail to injure the calf. Water drawn or pumped directly from the depths of a well is at about the correct temperature for her to drink; otherwise, it should have the chill removed from it before the cow takes it into her body. Impure or filthy water is even more dangerous than the ice-cold water, and will cause all sorts of serious derangements among the digestive, assimilative, and generative organs. For the same reasons, musty or unclean roughage and grain of all sorts should be rejected as rations for the pregnant cow.

Care of the Farm Horse.

(Continued from page 82).

is all he gets, and too often much more than he gets, for a lifetime of toil and service. I believe that we will some day render an account of our treatment of these creatures entrusted to our care to the Great Father who lends them to us.

But we owe it to ourselves as well. We do not invest in horseflesh, especially at present prices, as a matter of philanthropy. It is a business proposition. We buy horses because we expect a profit on our investment. The better care we bestow upon our horses the better service they will render and the longer they will last, hence it pays in dollars and cents. I drove the trail recently with a man whose team weighed 700 pounds more than mine. Our loads were the same 3,000 pounds, yet my team handled their load much more easily than the heavy team, simply because they were in shape to work. The prudent man will conserve his capital by a proper care of the horses that till his soil.—Bulman's Magazine.

Aberdeen-Angus Herd Book.

We have recently received from Mr. John W. Brant, Accountant, National Live Stock Records, Ottawa, a copy of Vol. II. of the Canadian Aberdeen Angus Herd Book. Copies of this herd book are supplied free to all members of the Association.

The Gaspereaux River Near Where The Nova Scotia Power Company Proposes to Obtain 18000 Horse Power.

African Geese.

Geo. N. Clark, Kent Co., N. B.—Can you advise me when I can buy a pair of African Geese? I have searched your columns in vain for an advertisement that would give me this information.

Ans.—A word to the wise is sufficient. Maritime Breeders of African Geese or any other variety of live stock would find it to their best interest to let their light shine through these columns and tell the public when they have surplus breeding stock for sale. The only African Geese that we saw out at the fall fairs were shown by: The Hartland Poultry Yards, Hartland, N. B.; Albert Boswall, jr.; French Fort, P. E. I. and A. Kenniston, Bangor, Main.

Dates to Be Remembered.

Maritime Winter Fair, Amherst, N. S.—December 4, 5, 6 and 7, 1911.

St. John Exhibition, St. John, N. B.—September 7 to 9, 1912.

"It is a pleasure to tell you that Chamberlain's Cough Remedy is the best cough medicine I have ever used," writes Mrs. Hugh Campbell, of Lavonia, Ga. "I have used it with all my children and the results have been highly satisfactary." For sale by All Dealers.

HAD VERY BAD COUGH

And Tickling Sensation in Throat.

Dr. Wood's Norway Pine Syrup Cured It.

Miss C. Danielson, Bowsman River, Man., writes:—"Last fall I had a very bad cough and a tickling sensation in my throat. It was so bad I could not sleep at night, so I went to a druggist and told him I wanted something for my cold, and he advised me to try Dr. Wood's Norway Pine Syrup which I did, and after taking one bottle I was completely cured. Let me recommend Dr. Wood's Norway Pine Syrup to anyone who suffers from a cough or throat irritation."

Dr. Wood's Norway Pine Syrup is without a doubt one of the greatest cough and cold remedies on the market to-day, and so great has been its success there are numerous preparations put up to imitate it. Do not be imposed upon by taking one of these substitutes, but insist on being given "Dr. Wood's" when you ask for it. Price, 25 cents a bottle; put up in a yellow wrapper; three pine trees the trade mark; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent user of my great appliance, it gives, in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night and all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back; from the first hour's use you experience a decided benefit; there is a great mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; woman and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfect manhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Let Me Send You These Two Books FREE

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice, either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one who needs new vigor.

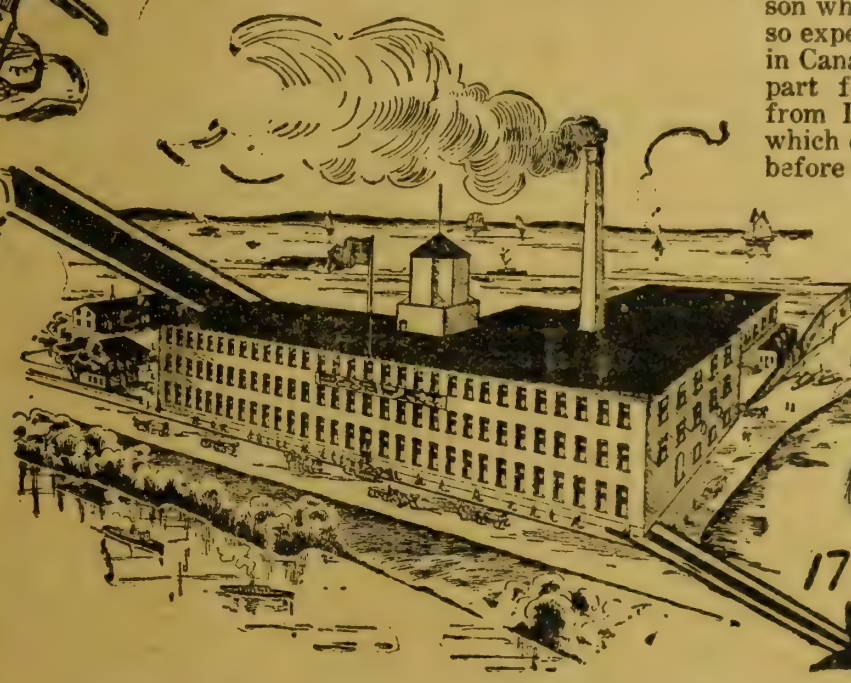
PAQUET FURS

From the Trapper Direct to You

Through Canada's Greatest Fur Factory

THE steadily increasing demand for PAQUET FURS has been the direct cause of the adoption of this new method of selling Furs, from Trapper to YOU. Our new system will enable every man and woman in Canada to enjoy the comfort of rich and luxurious Furs at prices they can well afford to pay—prices which have never before been possible—the MANUFACTURER'S PRICES of Canada's Greatest Fur Factory. It will enable us to keep our immense Fur Factories running at full capacity all the year round, turning out Furs and Fur Garments of the most approved designs originating in the great fashion centres of Paris and New York. The main reason why Furs have heretofore been so expensive is that other Furs sold in Canada, are made up for the most part from finished skins, bought from Dressing and dyeing Houses which charge a profit on the skins before they are cut into at all.



THIS FACTORY which is by far the largest establishment of its kind in Canada, and one of the largest in the world, is the only Fur Factory in AMERICA where every process, such as dressing, tipping, dyeing and finishing of Furs, from the raw skins to the finished garment, is in operation under the one roof. Thus, in dealing direct with with this Factory, you save all the intermediary profits.

This Fur Catalogue containing 80 pages of beautiful half-tone engravings (some in colors), and thousands of prices on Furs and Fur Garments, will be sent you FREE. Write us a postcard NOW !

(Continued on page 82).

Down With a Silo Monopoly.

Editor Maritime Farmer:—

The Iowa Asricultural Experiment Station has set out on a nation wide hunt for a home-made round sile built in 1898 or earlier, and incorporating some of the essential features of the patented structure of to-day. H. L. King, agricultural engineering experimentalist of the station, has offered a reward of $50 for the first definite information about just such a silo. He expects also to make a trip to several of the older dairying districts of the United States for a personal search for pioneer silos.

Back of this unusual hunt is the claim of the wooden silo manufacturers that American farmers cannot build round silos of any type or material without first paying tribute to them in license fees. They claim a patent monopoly and they have organized themselves to enforce it. In the past summer of extensive silo building, they sent out thousands of letters warning farmers who were putting up home-made silos and threatening suit for infringement.

This claim of a silo monopoly concerns the Iowa statian because two of its experimenters, Prof. J. B. Davidson and M. L. King, designed a successful hollow tile silo three years ago which they dedicated to the American farmer and his free use. This silo has been made the special object of attack in Iowa where nearly a thousand are in use. Letters warning farmers building these silos have been sent out and intimations of damage suits have been frequent, Whenever appealed to the station has made the positive statement, based on investigation, that neither brick, tile nor masonry silos in any way infringe upon wooden silo patents. After further investigation the station has taken the new stand that it is doubtful if the manufacturers really have a monopoly, as they claim, on wooden silo building.

"We have good reason to believe," says Mr. King, "that the special features of wooden silos for which patents are claimed were ueed in some of the silos built prior to the date of the patents, June, 1899. Those features are the continuous door, reinforced door jambs, door jamb braces and devices for holding the doors in place. Round wooden silos were in use long before 1899. We want additional information about them. For the first information received about such a silo containing some of these mentioned features, $50 will be paid if it is sent to the Iowa Agricultural Experiment Station, Ames, Iowa.

"The Iowa station is not setting out to fight any body. It merely wants to make certain about these disputed points and to protect the farmer in Iowa and in every state in what it considers their right to build round silos of brick, tile or masonry, and possibly of wood also."—F. W. Beckman.

Reduction in Price of Cement.

In November, 1910, it was announced that the price of Cement had been reduced. That announcement was admitted by many as corroborative of the opinion that the merging of the Cement interests in Canada would prove a good thing for the public.

The theory of a consolidation such as the Canada Cement Company is that the consolidated interests are in a position to effect economy in production and distribution.

That the Canada Cement Company are working upon the idea of increasing consumption by lowering prices, rather than curtailing production and obtaining higher prices, is clearly shown by its President's report to the Shareholders at the last Annual Meeting, when he stated: "It is confidently expected that the increased demand and increased output will result in further savings in the cost of manufacture and distribution, and it is the policy of your Dirctors to give your customers the benefit of these eductions."

This is further evidenced by the announcement, which was made on November 1st, 1911, of a still further reduction in the price of cement. The reduction in some districts is 10c per barrel, and in others, 5c. On the whole it will probably average 7c per barrel. This reduction—with the reduction made last year—means a very large saving to the cement consumers of Canada.

We trust that the expectations of lower cost voiced by the President of the Canada Cement Company, will be realized again next year, so that the Company may continue its policy of giving the benefit of these reductions to its consumers—thereby enlarging the uses to which Cement may be put.

Potato Growing.

Editor Maritime Farmer.

The potato crop being almost a failure this year, I believe you would be glad to give your readers the results of my endeavours to overcome the unfavorable conditions of the season; also the different results from certain fertilzers for this crop.

My land is clay loam under buckwheat last year. As soon as the buckwheat had started I spread a light dressing of barnyard manure (horse, cow and hog) as if I wanted a crop of buckwheat, and ploughed the whole down when about two inches high. I divided the field into three parts. Plot No. 1 no other fertilizer. Plot No. 2 at the rate of 200 lbs. Sulphate of Potash, 400 lbs. Acid Phosphate and 120 lbs. Nitrate of Soda per acre. The whole field was well harrowed and planted to Sensation potatoes. No. 3 (I had almost forgotten) at the rate of 400 lbs. Acid Phosphate and 120 lbs. Nitrate of Soda per acre.

The first two weeks the weather was splendid, but our first rain was not until 18th July followed by many days at 96 to 104 degree in the shade and from 108° to 130° in the sun. To prevent too great evaporation I kept the cultivator and hoe going nearly all the time. We got a few light rains in August, our hopes revived, things looked well; but in the night of August 31st potatoes, tomatoes, beans, corn, etc., were killed to the ground. The potatoes were certainly not more than half grown. However, I feel that God rewarded my persistency and courage, as the following results seem to show:

The seed was planted 30th and 31st May, killed 31st August, 3 months instead of 4 months at least.

Plot No. 1, light dressing of manure only, at the rate of 194 bus.

Plot No. 2, manure and in addition 200 lbs. Sulphate of Potash, 400 lbs. Acid Phosphate, 120 Nitrate of Soda, 242 bush.

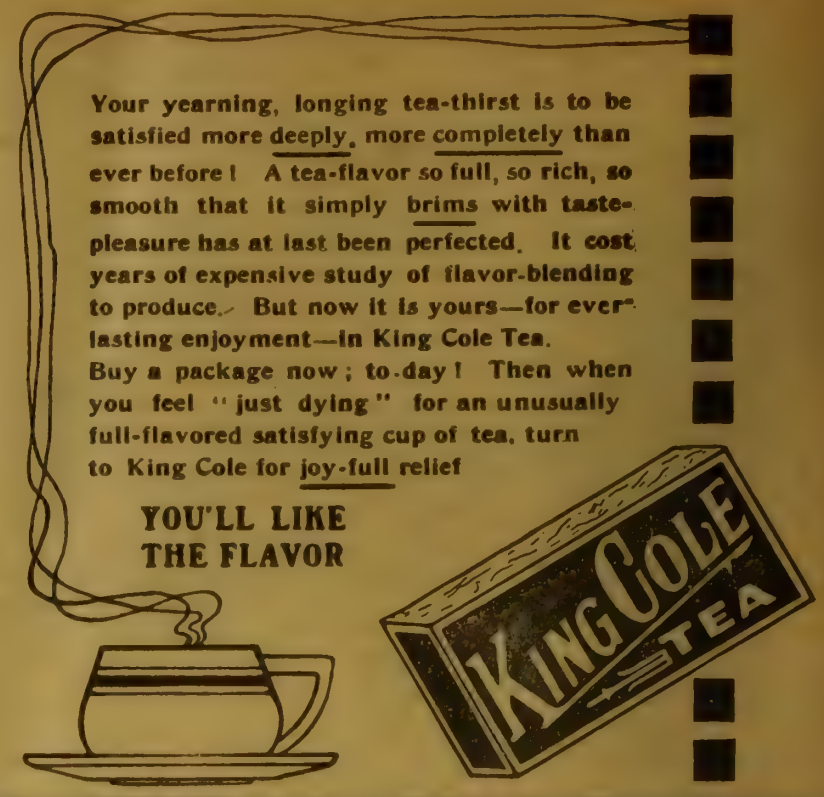
Plot No. 3, manure and 400 lbs. Acid Phosphate and 120 lbs. Nitrate of Soda, 204 bus.

The latter plot gave 12 bus. more than Plot No. 1 and Plot 2 gave 48 bus. more than No. 1. This means in the one case an increase of value, at .75 per bush (they are going up fast and will be at least $1.00 in the spring) of $9.00 and in Plot No. 2, 48 bus. at .75 gives an increase of $36.00.

Now, Mr. Editor, all up to date farmers will admit that the constant surface cultivation did a great deal of good, but will they give any credit to the green buckwheat ploughed in? I do.

Hoping that if any of your readers make any comments on the above you will kindly forward me the number or numbers containing them that I may complete statement if required. —Wm. H. Taylor, Potato Specialist, St. Giles, Lothiniere Co., P. Q.

Editors Note:—Mr. Taylor is a prominent member of the Canadian Seed Growers' Association.



Your yearning, longing tea-thirst is to be satisfied more deeply, more completely than ever before! Cooperage Production, 1910.

The amount of cooperage produced in Canada during 1910, has been compiled by the Dominion Forestry Branch at Ottawa. Reports were received from one hundred and thirty three firms, of which ninety four were in Ontario — showing that slack and tight cooperage was produced in Canada to the value of one million seven hundred and forty thousand dollars. As the hard wood forests of Canada are already greatly depleted, and of the Canadian products transported in barrels are chiefly flour and apples, requiring only slack cooperage, the tight cooperage stock manufactured in 1910 amounts to only one-fifth of the total value. Barrels made from tight stock are used as containers of oils, alcoholic liquors and other liquids, and as Canada has practically no wood of sufficiently clear quality for such stock, the most of it has to be imported as staves or stave bolts from the United States. Of the total, slack cooperage made up one million three hundred and ninety-five thousand dollars, which is two hundred thousand dollars less than the 1909 value. Notwithstanding the decrease in value of slack cooperage for 1910. the number of pieces produced was five hundred thousand more than in 1909. Practically no cooperage is manufactured in Canada for export, and whatever quantity is shipped out is the cooperage left on the manufacturers hands after the domestic market has been satisfied. In the middle of the last decade the export trade was quite an important branch of the cooperrge industry, but in 1910, exports of staves, heading and barrels amounted to only one hundred and fifteen thousand dollars.

Acadia Notes.

Acadia University in Wolfville, N. S. opened on October 4th. As yet the registration is not complete. but will no doubt, surpass that of last year, which was 230. The Freshmen number 83 ; this time last year they numbered but 70. The Senior class is this year the largest in the history of the University, numbering 46. The class of 1891 graduated 43, the the largest until the present year. The registration in Acadia Seminary and Horton Academy is as large as last year, while applications in hand show that it will be somewhat larger.

The teaching staff of the University has been enlarged by the coming of two new professors, Prof. Thompson in Latin and Prof. Jpidle in the department of Theology.

Every day the campus swarms with football men who are working hard to put up a team that will win the incollegiate league.

A pleasant time was spent Friday evening, (Oct 20) by the student body at an "At Home" given by the college Y. M. C. A. and Y. W. C. A.

The department of Biology under Prof. H. G. Perry is in a flourishing condition. The study of Insects and Bacteria proves very interesting, especially to those students who look forward to systematic Farming.

The Ontario Business College.

The commercial field offers far greater and surer opportunities for success in life than any profession. The professions are so crowded that many professional men have difficulty in earning a living. In contrast with this condition the demand by business men and manufacturers in all parts of Canada for well trained, industrious young men and women as bookkeepers and stenographers, many of whom, beginning in this way, will by and by become employers themselves, is never fully met, and it is greater now than ever before. Every young man and woman should have a thorough commercial training such as is given at the Ontario Business College of Belleville, Ontario.

This old established institution is now in its 44th year, and for 34 years Mr. J. W. Johnson, F. C. A., has been the principal. Each year students come to the O. B. C. from every province of Canada, from the United States, all the West India Islands and from British Guiana, South America.

Ayrshire Records.

In a recent list of records of Ayrshire Cows and Heifers that have registered in the Record of Performance, Milkmaid 7th—28,796—a two-year-old heifer owned by Wm. McRae, East Royalty, P. E. I. heads the two-year-old list in quantity of milk and total quantity of butter fat. Her record for 365 days was : — 11,673.5 pounds milk, testing 4.22 per cent. butter fat ; total butter fat 492,75 pounds. The example set by Mr. McRae in testing his cows should be an incentive for others to follow.

W. F. Stephen, Secretary Canadian Ayrshire Breeder's Association, writes :

since the commencsment of the test 164 cows and heifers have registered summarized as follows : —

Class	Lbs. Milk.		Lbs. Fat.
55 Mature cows with	10213.05	and	397.82
17 Four-year-olds with	8896.20	"	358.07
29 Three-year-olds with	8273.79	"	337.63
65 Two-year-olds with	7222.89	"	294.54

Shopshire Sheep For Sale.

On another page of this issue will be found Mr. S. A. Logan's advertisement of a big Shropshire Sheep Sale which will be held near the Winter Fair Building, Amherst, N. S., on December 6th, at 1 o'clock p. m, This will afford parties who wish to buy and breed pure bred Shropshires an excellent opportunity to get a good start. Railway fares to the Winter Fair are so cheap that no one can afford to stay away. Mr. Logan's Shropshires are so well known that they need no introduction to our Maritime Farmer reoders.

Best barrel Baldwin, grown in S. Kings—1st prize $5, offered by Mitchell's Shoe Store; 2nd prize $4, offered by J. G. Van Buskirk, tailor. 1st, J. L. Hardacker; 2nd, J. D. Sherwood.

Best barrel Baldwin, grown in Hants Co.—1st and 2nd prizes, $6, and $4, offered by Capt. R. Pratt; 1st R. Duncanson; 2nd H. Loomer.

Best barrel Stark, grown in Kings Co.—1st prize $5, offered by T. E. Hutchinson, E. P. Brown.

Best barrel Stark, grown in Hants Co.—1st prize $5, offered by W. M. Christie; 2nd prize $4, offered by W. H. Curry. 1st, H. Loomer; 2nd P. S. Lawrence.

Best barrel Golden Russett, grown in S. Kings—1st prize $5, offered by Prof. Clarence Hemmeon. H. A. D'Almaine, Wolfville.

Best barrel Golden Russett, grown in Nova Scotia—1st prize $5, offered by J. H. Lombard; 2nd prize $3, offered by F. C. Rand, 1st E. T. Neily; 2nd P. C. Inglis, Tupperville.

Load This Wagon To the Fullest Capacity

Every dollar invested in a T-K Handy Farm Wagon will be repaid over and over again in saving work loading and unloading besides this wagon will carry as heavy a load as any pair of horses can draw, without tireing them. It earns money for you and makes farm work easier.

T-K Handy Farm Wagons and Wide Tire, Steel Wheels

The success of our Wide-Tire Steel Wheels has been unprecedented in the history of wheel manufacture. They solve the problem of getting over the worst roads without lightening the load or tiring the horses. Mud won't clog them, bad roads won't injure them, yet they are cheaper than wooden wheels.

The 3 H's--HEALTH, HAPPINESS, HOME

That is what Domestic or Household Science deals with—and its object "THE SECURING OF THE MAXIMUM NOURISHMENT AT THE LOWEST COST AND WITH THE GREATEST EASE OF PREPARATION."

Now this applies not only to food values but to the STOVE on which the food is cooked, and the fact that the—

Enterprise Monarch Steel Range

as shown, is used by so many Domestic Science teachers throughout the Maritime Provinces and Quebec, is good evidence that this range is recognized as the one most suitable for the purpose.

In addition to this it is in use in hundreds of homes and hotels and giving perfect satisfaction.

Then too its large fire-box for wood burning makes it the ideal range for farm kitchens.

Sold by Leading Stove Dealers Everywhere. Descriptive Circular on Request.

You Can Make Better Foods For The Children With "Beaver" Flour Than You Can Buy

Next to a returning Arctic Explorer, the hungriest mortal on earth is a growing boy. He is always ravenous. "He will eat anything". But why should he?

Right now is the time when his parent should be most particular about his food—to prevent injudicious eating and to protect him against unsuitable food.

Good, home-made bread, made of "Beaver" Flour—light, flaky biscuits made of "Beaver" Flour—these are real foods for growing children. "Beaver" Flour is a blended flour. That is, it is made of exact proportions of nutritious, beautifully flavored Ontario Fall Wheat and a smaller proportion of the stronger Western Spring Wheat.

It is both a bread flour and a pastry flour—and makes the real nutty flavored home-made bread and delicious pastry such as cannot be made with any purely Western Wheat Flour.

Just try "Beaver" Flour—and see for yourself how thoroughly satisfactory and dependable it is for all kinds of baking. Your grocer sells "Beaver" Flour or can get it for you. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

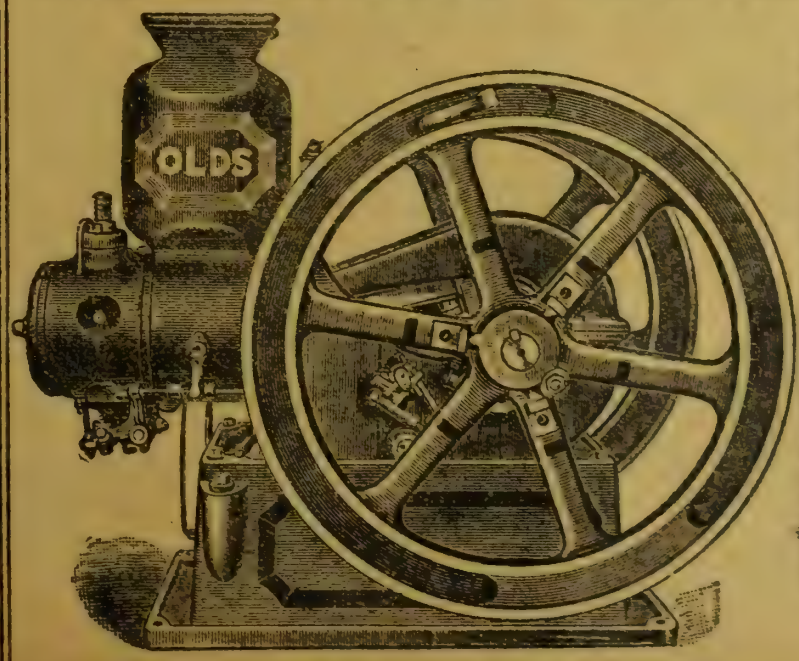
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Compsny, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Halifax Prices.

Flour—$4.60 to $6.35; Beans—$2.30 to $2.45; Peas—$5.75 to $7.00; Oatmeal Standard, in bbls.—$6.15 to $6.25; Oatmeal Standard, in bags—$5.95 to $6.05; Rolled Oats, in bbls.—$5.60 to $5.70; Rolled Oats, in bags.—$5.40 to $5.50; Middlings—$27.50 to $28.50; Bran—$26.50 to $26.50; Shorts—$27.00 to $27.50; Feed Flour, bag 98 lbs.—$1.75 to $1.85; Cornmeal in barrels—$3.85 to $3.95; Cornmeal in bags—$1.85 to $1.90; Feed Oats, in bags—.55 to .57; Hay—$12.00 to $14.00.

Butter.—It is each day becoming more apparent that stocks of butter in the hands of Canadian dealers are none too large, and that the prospect for a supply of fresh made promises a sufficient quantity to meet future requirements. Holders, therefore are very confident in their ideas for the future of the market. Factory men are asking 27 to 28 cents f. o. b. for best creamery. The high prices may affect consumption of this grade to some extent, but even then there does not seem to be any prospect of a surplus. Very little dairy butter is offering at the present time, and what is coming forward is Provincial and not very good, and now that the cheese factories have closed down, we may expect supplies of dairy rolls from Ontario. This will relieve the situation somewhat.

Cheese.—The cheese market is very firm. Stocks are not large, and the dealers' needs are urgent. Last sales at Island cheese boards were made at an advance over the board price of the previous week. This completes the marketing of the different factories for the present year, and it is interesting to know that October make brought a higher price than September. September, strange to say was sold below the price of August. Usually, as our readers know, September is the most expensive and best cheese of the year, but the August market was extremely high this year and when grazing conditions improved in September, it affected the price of cheese for that month.

Eggs.—The price of eggs advanced very suddenly on Monday of this week, and dealers are now asking 28 to .30 cents, according to quality. The egg situation is abnormal, and it has been brought about by the disastrous effect of the drouth in Europe during the past summer. Germany and other countries have been compelled to look to Australia and New Zealand for a supply of farm products this winter, and the effect of this is felt in the general market prices elsewhere.

The following are Halifax jobbing prices to-day:

Creamery Prints—30cts. per lb.; Creamery Solids—29cts. per lb.; Dairy Solids—24cts. per lb.; Cheese, Twins—16cts. per lb.; Cheese, Large—15cts. per lb.; Eggs, Selected—28 to 30cts. per doz.; Fresh Eggs—27cts. per doz.

GREEN FRUITS AND VEGETABLES

There does not seem to be an unusually large supply of good quality apples locally, despite the large crop in the province this year; the market, however, is heavily supplied with poor stuff which has to be sent to auction.

Apples, Gravensteins—$1.50 to $2.50; Apples, Kings—$2.50 to $3.00; Apples Other Varieties—$1.50 to $2.50; Pears, native, half barrel—$2.00 to $3.00; Beets, per bbl.—$1.25; Carrots, per bbl.—$1.50; Potatoes, per bag—$1.75; Celery, per doz.—$1.35; Cabbage (native) each—.05 to.07; Native Squash—.01½.

FRESH MEATS AND POULTRY.

The supply of turkeys at present is poor and the trade are looking for stiff prices until after the end of the year. If any change, pork is easier. There seems to be a large supply of pork in the provinces, no doubt as a result of the high figures which have ruled for the past three years. Lamb is much easier, owing to large supply and very few foreign purchasers. Beef is holding its own, but the supply of very ordinary stock is almost too large, due to the fact that farmers are killing off animals that they do not wish to feed over winter. We quote Halifax jobbing prices as follows:

Fowls, per lb.—10 to 12 cents; Turkey, per lb.—20 cents; Chickens, per pair—.70 to $1.00; Ducks, per lb.—.15 to .18; Beef, per lb.—.09 to .10; Mutton, per lb.—.08; Veal, per lb.—.06½ to .07; Pork, per lb.—.07 to .07½; Lamb, per lb.—.08 to .09.

St. John Prices.

The market is well supplied with all kinds of produce. There is a move on foot to get the supply for the first winter boat. Mutton will be in demand after the first of the next week. Pork is easy at 7cts. Poultry is slow this week if the weather turns cool the prices will go higher. Good Butter is in demand at good prices. The provision market in general is fair. We are looking for good markets until the Christmas holidays

GRAIN—Buckwheat, $2.25 to $2.50.

LIVE STOCK—Milch Cows, $40.00 to $50.00.

DRESSED MEATS—Beef (carcass), .05 to.08; Beef (retail), .10 to .18; Mutton, .07; Veal, .09 to .10; Lamb, .09 to .10; Pork, .06½ to .07.

DAIRY PRODUCTS—Creamery Butter, .25 to .26; Dairy Butter, .24 to .25 Cheese, .14.

DAIRY AND POULTRY PRODUCTS—Eggs, .35 to .40, fresh; Fowl, .70 to .90; Ducks, $1.25 to $1.40; Geese, $1.10 to $1.40; Turkeys, .23 to .25.

FRUIT—Apples, $1.25 to $2.00.

MISCELLANEOUS—Hay, $10.00 to $12.00 ton; Straw, $8.00 ton; Wool, .14 to .21; Beef Hides, .11; Calf Skins, .16; Sheep Skins, .60 to .65; Lamb Skins, .60 to .65.

VEGETABLES—Carrots, 1.25 to $1.30; Potatoes, $1.75 to $2.00; Turnips, .80 to .90; Beets, $1.25 per bbl.

TAKE THIS BELT

AND BECOME

A MAN

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY and in every other respect if they would guard their health. With VIGOROUS HEALTH—a body full of ELECTRICAL ENERGY—a man can make OPPORTUNITIES if he don't find them, but lacking in the COURAGE and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES—MENTAL DEPRESSION—SLEEPLESSNESS—NERVOUS DEBILITY—without HOPE—AMBITION — COURAGE gone — drifting with the tide—and I can transform him into a STRONG MAN—A man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, and he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. Save your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure one of these appliances—USE ELECTRICITY, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT OF YOUR LIFE. Here is what some say of this remedy, who have used it:

Dear Sir,—I am perfectly satisfied with your Belt for what it has done for me. I am now a well man.

Yours, very truly,
HUGH McLEAN.
New Glasgow, N.S., Box 464.

Dear Sir,—I find your Belt all right for every kind of pain that is felt in the human body, and I have not missed a day with sickness since I got the Belt.

Yours very truly,
JAS. W. BARRIE.
Auld's Cove, N.S.

Dear Sir:—

Having received a Belt from you some years ago, I now desire to express myself in regard to the benefits, which I received from it. I wish to say in as few words as possible that it was all that it was represented to be, having cured me of Indigestion and other ailments, and I must say that I feel a new man, and I give all credit to Dr. McLaughlin's Electric Belt. I would advise any one suffering to give the Belt a trial, and I know they will feel as I do. Although I have been four years benefited without saying so to you, I have been doing all I could in my locality personally. So giving you the privilege of using this letter as you wish, and wishing your Belt every success, I remain,

Sincerely yours,
SAM J. HARNETT.
North Gower, Ont.

Any man or woman who will give me reasonable security, I will send them the Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Never mind waiting until you use the last dose of that bottle from the drug store. Begin now. Call and talk your case over with me or send for my book. It costs you nothing. For over 24 years I have taught the great truth that "ELECTRICITY IS LIFE," and have proved the soundness of my doctrine by making cures when others have failed time and again. Others have aspired to do the work I am doing with my ELECTRIC BELT. They offer you Electricity in some other form, or an "electric belt" that possesses no curative power whatever. They are like "boys on bladders" floundering in a sea of uncertainty—while to-day the DR. McLAUGHLIN ELECTRIC BELT stands the world over as the most correct—the most perfect—method of applying Galvanic Electricity to the body that has ever been devised. Call at once or send coupon for our FREE illustrated 80-page book, from which you can learn much that you want to know. Do it now.

FLORICULTURE.

Correspondent, Hampton, N. B., writes:—

I was presented with a fine Heath plant, in bloom, last winter. It grew well during the Spring and I planted it out-of-doors during the Summer. When I dug it up and potted it this fall the leaves had all fallen off and it looked poorly. It does not show any signs of growth, although I keep it in a nice cool room where there is lots of sumlight. Please advise me what to do to revive it.

Ans:—The plant is a true Erica and your treatment of it, during the Summer, probably dried it out and thus killed it. "A dry heath is a dead heath," is an old saying among gardeners. I feel quite sure from your description that the plant is dead. You should not have allowed it to dry up.

A. W. wants to know how to grow her Calla Lily.

Ans:—The Calla Lily likes plenty of water and sunshine when growing. It should be planted in a cool, dry, shady position in May and remain dormant until the first of September, when it should be potted in new soil, watered and started into growth. Without such rest the plant will seldom bloom well. When the pot is crowded with roots it will be better for a heavy feeding with liquid manure. The Calla Lily is one of the few plants that should be watered through the saucer. The saucer should be kept full of water all the time.

The Harrisii or Easter Lily should be potted in a six or seven inch pot, the top of the bulb near the surface of the soil. Water sparingly until the pot fills with roots and top growth is established, when they will require much more water. Never let any lily, in active growth wholly dry. After blooming dry the bulbs off by gradually withdrawing the water. Keep the bulbs in a dry, cool place, without being disturbed until the fall when they may be shaken out of the old soil and repotted as before.

H. W., St. John, wants to know how to grow Smilax, bought from the editor of this column.

Ans:—Smilax likes a night temperature of about fifty-five degrees, shade and moisture on the foliage, and plenty of water when growing. It should be dried off so that it will become dormant during the Summer. After a two-months' rest the tubers should be divided and planted in fresh soil, watered and started into fresh growth again. It should have strings or some sort of trellis, on which to climb.

R. K., St. Stephen, N. B. writes:—

My Hyacinths have been in the cellar since the first of October. They are beginning to sprout and some of them are sending out bud stems, with only a few leaves. The top of the clump of buds is all covered with a blue mold and seems to be rotten. The roots are coming through the bottom of the pot. Should they be brought to the sunlight at once? If not, when? The cellar is quite cold and damp.

Ans:—By all means bring the bulbs to the light at once, if the roots are coming out of the bottom of the pot Do not give them the full sunlight at first but place them near a window until the leaves and bulbs have turned a glossy, dark green then give them full sunshine and water thoroughly. It is likely that the moldy tip of the flower stalk will rot and thus disfigure the flowers somewhat, but not necessarily spotting them.

All persons forcing Dutch bulbs should look carefully to them from now on and bring to the light as soon as rooted. It is not well to allow them to grow too much in the dark. If only fairly rooted, should they begin to grow too much, it is better to bring them to a light cool room. They will complete their root growth before the bloom begins to develop. Do not allow them to become dried out while in the sunshine.

H. A., Hampton, writes:—

What shall I do with my Hollyhocks. Last year I left them in the border and the ice seemed to rot them as there was nothing left in the Spring but some green pulp. I have a good lot of plants and do not know what to do with them. I notice some of the plants have young sprouts at the bottom of the flower stalks. Should these be taken off? When is the best time to plant Paeonies? What is the best lily bulb for fall planting.

Ans:—Hollyhocks, in beds where ice would form, should be dug up, planted in boxes and placed in a dark, cool cellar—a warm cellar will not do. Cut the flower stalks off about six inches from the top or crown. The young sprouts you mention are the beginning of growth for next year and unless they are present the roots are of no value. Hollyhocks often go blind this way so do not

SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

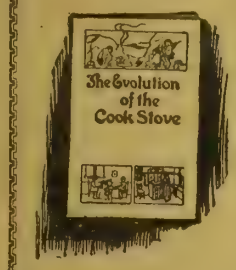
$41.00 TO $49.00 AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of **tough, strong, malleable iron** and the **best blue polished steel**—materials which **will not warp, crack or break.**

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it **saves over 30% of fuel,** burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. **If not convenient to pay cash we will arrange to accept your note.**

Canada Malleable & Steel Range Mfg. Co., Limited, Oshawa, Ont.

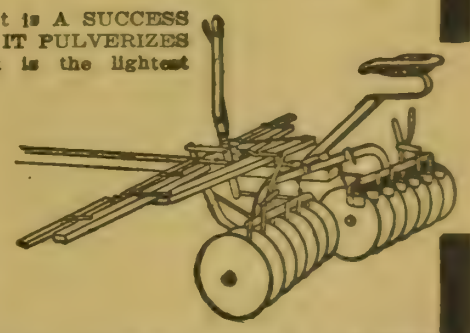
When writing it will be a distinct favor to us if you will mention this paper. 7

Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.



Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept M for free catalogue.

Had Palpitation of the Heart

Weakness and Choking Spells.

When the heart begins to beat irregularly, palpitate and throb, beats fast for a time, then so slow as to seem almost to stop, it causes great anxiety and alarm. When the heart does this many people are kept in a state of morbid fear of death, and become weak, worn and miserable.

To all such sufferers Milburn's Heart and Nerve Pills will give prompt and permanent relief.

Mrs. John J. Downey, New Glasgow, N.S., writes:—"Just a few lines to let you know what your Milburn's Heart and Nerve Pills have done for me. I was troubled with weakness and palpitation of the heart, would have severe choking spells, and could scarcely lie down at all. I tried many remedies, but got none to answer my case like your Pills. I can recommend them highly to all having heart or nerve troubles."

Price 50 cents per box, or 3 boxes for $1.25. For sale at all dealers or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

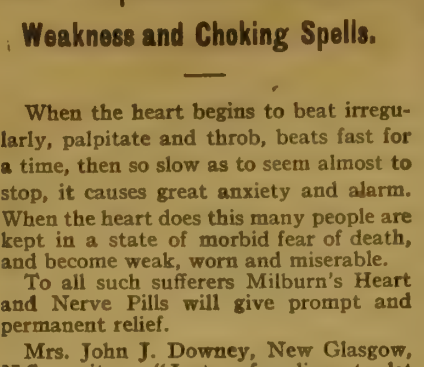
MAXWELL'S
HIGH SPEED
CHAMPION

has the largest opening of any washing machine. Practically the whole top opens up because the wringer attachment is on the side. No other washer washes clothes so quickly—so well—so easily. Tub made of Red Cypress—will last a lifetime. In every respect, the "Champion" is the champion of all washing machine.

If you want quality butter, use Maxwell's "Favorite" Churn.

DAVID MAXWELL & SONS,

St. Mary's Ont.



See large opening in tub. So easy to put in clothes.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

bother with crowns that have no young plants in sight. Plant Paeonies any time now. This is far the best season of the year to transplant. Fairium Auratum is the best Lily. Bulbs may go into the ground any time now before the ground freezes too hard to cover them. ...

Plant Shrubs now, hardy Vines and trees later, if you do not want to wait until Spring.

Hardy plants that do well to plant now are the Sweet William, Larkspur, Forget-me-not, Fragrant Pinks, Foxglove and Canterbury Bells. You cannot beat the old fashioned flowers that come up year after year and can be so planted as to have flowers all through the season.

Inquirer, Wolfville, N. S., writes:—Do you consider that placing Moss on the top of a plant pot and thus covering the soil would injure the plant? I have a number of Chinese Sacred Lilies, some of them in bowls of water. They are growing well but the tips are turning black. Is this going to spoil the flowers, and if so, what shall I do to save them? I have had given me some bulbs, one the Jacobian Lily and two other small bulbs marked Atamasco. Are they for winter blooms and what color flowers do they bear? Should they be planted like other bulbs?

Ans:—Moss on the top of the soil in which a plant is growing is very objectionable for several reasons. First, it is very difficult to tell whether a plant is thoroughly watered, or not as the top of the pot may be quite moist while the bottom soil may be thoroughly dried out. Second, it is a great place to cultivate a crop of insects as it provides a hiding place for many of a very injurious nature. I do not think the blooming tips of the Giant Narcissus sprouts cause any damage to the blossoms. I have often noticed it but never saw any harm therefrom—be sure that plenty of water is kept in the bowls. The Jacobean Lily is a Summer bloomer and should be kept dry during the winter. The color of this Lily is a dark scarlet. A peculliarity of this Lily is that like the Hyacinth it can be forced in water. The Atamasco Lily produces waxey flowers of various colors. It is a winter bloomer and its habit of growth is similar to the Amaryllis.

Beet Top Poisoning.

As the beet digging season is now on, a word of caution is advisable on feeding the tops. Every fall the tops are used for feed and this is usually done by turning the animals into the fields after the beets have been hauled out. Also every fall reports come in of stock dying from eating the tops.

Death comes from two general causes: First, and probably most common, is the oxalic acid poisoning. Beet tops contain a considerable amount of this acid, and when a considerable quantity of tops is consumed, it is very likely to produce oxalic acid poisoning and death. Animals may die very quickly from paralysis of the geart, or they may show great depression and diarrhea and live for several days, or even recover.

grows on the beet tops and is more

The other cause is mold, which prevalent in damp weather. Anything moldy is dangerous as a food, but moldy tops and moldy beets are especially so. The tops that are dry, or nearly so, while they may not be so palatable, are really safer.

Feed in moderation. When in good condition, however, the tops save feed; but when given in too large quantities, or when moldy, they do a great deal of harm.—I. E. Newsom, Colorado Agricultural College.

ARNOTT INSTITUTE

The work of the ARNOTT INSTITUTE in treating Stammerers and Stutterers is becoming more and more widely recognized as perhaps the most successful on this continent.

Following our own scientific methods, the Institute treats the CAUSE of stammering—not the habit itself. It teaches the patient **why** he stammered, and once he understands that, it is comparatively easy for him to learn, in from five to eight weeks, how to speak fluently and naturally, without any of the objectionable mannerisms commonly taught. As he knows **why** he is speaking correctly, the cure is permanent.

If you know anyone who stammers or stutters, in kindness to them advise them to consult the ARNOTT INSTITUTE.

N. B. Fruit Growers' Annual Convention.

(Continued from page 72).

fruit. I mean the farmer who has a few trees and takes with a thankful heart such fruit as they may drop down to him every autumn. There are not many farms without a few apple trees growing as weeds in the hay field, or where the grass is growing as a weed in the orchard, I never could quite decide which, and it is not an uncommon thing to find a plot of 20 or 30 such trees without a single tree of hrafted fruit. The trees are seedlings transplanted from the wayside or elsewhere and set in orchard form to contribute what they may to the sustenance of man or beast. These same trees will occupy no more space as good fruit than they do at present, and may be easily and speedily transformed. This year I picked two barrels of excellent Astrachans from a tree which five years ago yielded about a barrel of worthless fruit, and I have some Mc Intosh Reds on exhibition here, grown on trees that a few years ago were a shapeless tangle with fruit of no value. Turn your trees to good varieties and take care of them, and just in the measure of your generosity of treatment they will yield you returns.

Our display of fruit in the rink this year must be a source of pleasure and pride to all who love good fruit and I trust that each succeeding year will find us advancing in all our methods until we attain a position among fruit growing sections which our natural advantages urge us to aim for.

Following the reading of the President's address, Mr. Tappan Adney, of Woodstock, took up an interesting discussion re Experimental Orchard word and elucidated, some of the "Why's" which are responsible for the fact that certain varieties of fruit thrive better in some sections than others.

Mr. A. G. Turney, the Provincial Horticulturist read the following Synopsis of a proposed System for giving futurity prizes to encourage more extensive and better orchards:

SYNOPSIS OF THE COMPETITION.

1. To properly direct and oversee in accordance with the principles of modern orchard practice the present extent of apple orchard planting in the province which planting, under the present lack of system and proper preparation is detrimental to the development of the orchard industry and is not productive of the financial results which the expenditure of time labor and capital under proper direction, should warrant.

2. To encourage the planting on our farms of orchards of a commercial size.

3. To eliminate the planting of undesirable varieties and to confine the setting of new orchards to fewer varieties of proved commercial quality and hardiness in New Brunswick.

4. To bring intending planters of apple orchards into touch with the Provincial Department of Agriculture and thereby assist them in the selection of proper soils, sites, varieties and nursery stock.

5. To strengthen and encourage the Fruit Growers' Association and thereby foster the adoption, so much to be desired, of co-operation between the fruit growers.

6. To develop generally the apple growing industry in the province.

It is proposed that the sum of 2000.00 together with interest accruing shall be offered in prizes for apple orchards planted in the province of New Brunswick and entered for competition in accordance with the rules and regulations given below; The amount to be subdivided as follows:—

A. $1000.00 to be offered as prizes or apple orchards of not less than two acres and not more than five acres as follows:
1st, 175; 2nd, $150; 3rd,$135; 4th, $120 5th, $105; 6th, $90; 7th, $75; 8th, $60; 9th, $50; 10th, $40.

B. $1000.00 to be offered as prizes for apple orchards of not less than six acres and not more than ten acres as follows:—
1st, $200; 2nd, $175; 3rd, $150; 4th, $125; 5th, $100; 6th, $75; 7th, $75; 8th, $50; 9th, $50.

It is proposed to obtain this money by setting aside the sum of $400.00 per year from the annual appropriation for the encouragement of horticulture in the years 1912, 1913, 1914, 1915 and 1916. The interest accruing upon these deposits to go either towards defraying the judging expenses or to be offered in the shape of small additional prizes.

RULES GOVERNING THE COMPETITION.

1. Individuals only shall be eligible to compete. Orchard and Land Development Companies are not eligible for competition.

2. Orchards to be eligible for competition must be planted in either 1912 or 1913.

3. No orchard shall be eligibe for competition unless its owner pays regularly for five years from the date of planting the annual membership fee of the New Brunswick Fruit Growers' Association of $1.00 and is a member of that Association in good standing during the said five years.

4. Owners of competing orchards must pay the membership fee of $1.00 to the New Brunswick Fruit Growers' Association for the four years after the year of the planting of the orchard when called upon to do so by the Secretary of the Association.

5. All entries must be accompanied by the membership fee of $1.00 for the New Brunswick Fruit Growers' Association except where the owner of the orchard to be entered in competition is already a bona-fide member of the Association for the year in which the orchard was or is to be planted.

6. Notice must be given to the Provincial Horticulturist at least two months in advance of the actual date of planting that it is the intention to plant an orchard and enter the same in the orchard competition.

7. Full particulars of competing orchards must be furnished to the Provincial Horticulturist on prepared entry forms provided for the purpose.

8. All orchards shall be judged in the sixth summer of their growth; orchards planted in the summer of 1912 shall be judged in the summer of 1917 and those planted in 1913 shall be judged in the summer of 1918.

9. At the conclusion of the judging in the summer of 1919 should the awards be in doubt between two or more orchards planted in different years, the judges before coming to their decision shall visit those orchards again which were previously judged in the summer of 1917 and between which orchards and those judged in 1918 there is a doubt as to which is best.

10. The judge shall consist of the Horticulturist of the Provincial Department of Agriculture and two other men to be sudsequently selected by the executive of the New Brunswick Fruit Growers' Association.

11. Owners of competing orchards must furnish the judges with all desired information but shall not attempt to interfere with or bias the judges in arriving at their decision.

12. The orchards shall be judged primarily according to the score card decided upon by the executive of the New Brunswick Fruit Growers' Association after consultation with various horticultural authorities.

The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

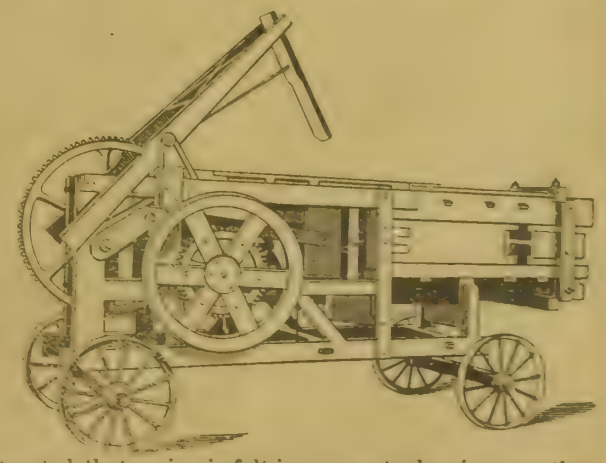
Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

J. D. FRIER, Sussex, N. B., Eastern Representative.

Improved Trenholm Gear Hay press

Operated With Gasoline Engine or Tread Power.
The More Power The More Work.



Note the strong, heavy frame built of the best quality of well seasoned hardwood. The heavy balance wheel weighing over 500lbs. The heavy cog wheel weighing over 500 lbs. Thesidesprings made of the best quality of spring steel. The bale box is steel lined and the whole machine so powerfully constructed that no jar is felt in any part when in operation.

This is now the season for Wood Cutters, we manufacture them in three different sizes; Long Swing, Short Swing and Flat Roller Table.

In Farmer's Feed Boilers we make the Star with steel frame and cast culdron in three sizes and the All Cast in two sizes.

We can fill your orders at quick notice. Get our catalogue and prices at once.

Growing the Montreal Melon for Market.

(Continued from page 71.)

is the greatest enemy af all melons. If pots or berry boxes are used the roots are disturbed very little in the transplanting. Careful watering and perhaps shading is necessary for a few days until the plants are established. Frequent shallow cultivation is neeessary. The roots are near the surface and must not be disturbed.

About the first of June we commence to harden the plants. This is done by careful manipulation of the sash and by lifting the frames. This is done by placing bricks under them. Very soon the vines commence to creep out from under the frames and then the fruit should set quickly.

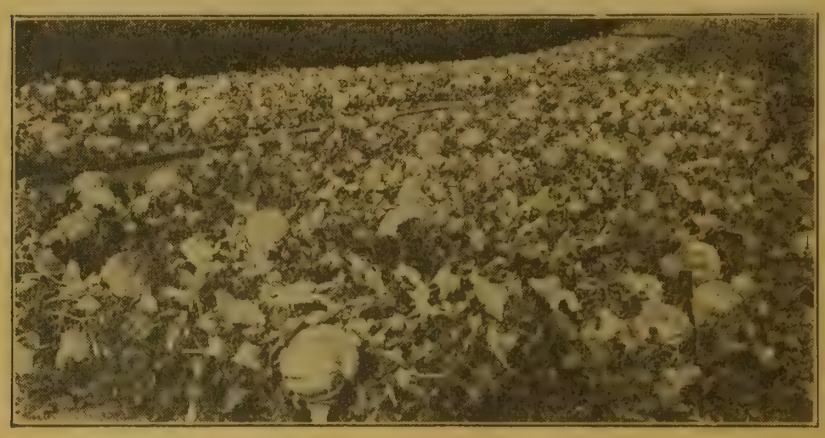
ve ry soon the sash and frames are entirely and permanently removed. This year we did it about the middle of June, but it is often necessary to let glass remain until the first of July.

As soon as the melons have become the size of cocoanuts they mnst be turned from day to day that every side may be equally ripened. Even with the gieatest care the flavor of one side is often better than the other. They must be kept from the ground too, for the ground induces rot and impairs the flavor. For this purpose stones are often used; inverted berry boxes answer very well; but what we believe is better than either is straw matting cut 1 inch x 1 inch or less. This keeps the fruit effectually from the ground, holds no water and ss cheap.

The productiveness of the plant is amazing. Some growers sell $2000 or more of fruit per acre. It must not be forgotten that the expense of growing is very great. In addition to other expenses, the plants must be watered in a dry time.

The basket is the common package used in the marketing of this fruit. It is expensive and not altogether desirable, yet on the Montreal market it is everywhere in evidence.

The crate was used at Macdonald this year and was found very satisfactory. They are of necessity very large and strong.



Melons at Macdonald---Some Idea of Their Productivness may here be Obtained

Melons, in common with other plants have many enemies. First there is the striped cucumber bettle. They are known and feared in every locality. Many repelants are recommended but I have not found any method entirely satisfactory. They also help to spread Melon wilt, a bacterial, desease very destructive and decidedly hard to cure. Plants attacked with the wilt show a sudden flagging without any apparent cause.

Montreal Melon Basket.

We found it necessary to pull out and destroy every plant showing wilt and the disease did not spread. Bacillus Melonis, another bacterial disease, cansing soft rot of the fruit visited our plantation but did little damage. What did gaeater damage was the red spider. It thrives best in dry, hot weather. We had our share of both insects and heat. It can be quite readily controlled by spraying with cold water. It must be done frequently and thoroughly. The melon louse is troublesome in some sections but has not given us trouble. It is a large green aphid, which may be controlled by soapy washes or kerosene emulsion.

We have outlined the usual method of growing tho Montreal Melon. There are other ways of doing it which necessitate less labor, give excellent fruit before frost, but the market does not demand it then, as it does during the heat of July and August. It is the man who beats his neighbour in time, who wins the golden prize in Melon growing.—E. M. Straight, McDonald College, Montreal.

FELL FROM A HAY LOFT

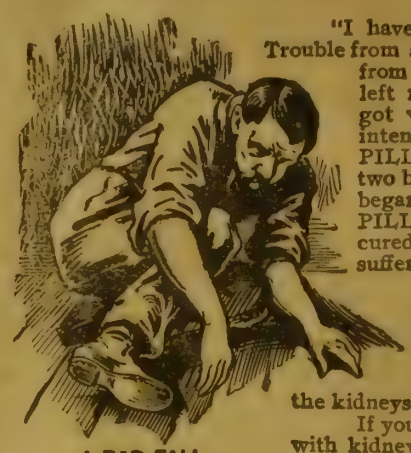
Suffered Tortures With His Kidneys Until He Tried Gin Pills

You might think that Mr. Baker needed a surgeon more than GIN PILLS. But there were no bones broken. His back was strained, which was harder to cure because nothing seemed to do any good. It is the same with a sprained ankle and broken leg. You can set the fracture and it will be well in six weeks—but the sprain may take months to get well.

However, Mr. Baker found the quick way to get relief from the pain—here are his own words.

AULTSVILLE, ONT.

"I have been a great sufferer from Kidney Trouble from an injury to my back caused by falling from a hay loft about six years ago. This left my kidneys weak, so that every cold I got would settle in my kidneys and cause intense suffering. I was advised to try GIN PILLS. I found, to my surprise, after taking two boxes, that the pains were relieved and I began to feel better. I am still taking GIN PILLS and feel sure I will be completely cured. I recommend GIN PILLS to all who suffer from any Kidney Trouble". C. BAKER.



A BAD FALL

You see, the fall had strained the kidneys and they were affected by the slightest chill. GIN PILLS immediately strengthened the kidneys—soothed any irritation and thus enabled the kidneys to overcome the effects of the fall.

If you are having pain in the back—or trouble with kidneys or bladder through accident or overwork—do just as Mr. Baker did—take GIN PILLS. They will help you—cure you—or we will promptly refund your money Buy six boxes at your dealer's. If, after taking them, you feel that Gin Pills have not helped you, return the empty boxes and get your money. We will take your word for it. 50c. a box, 6 for $2.50. Sample box sent free if you write National Drug and Chemical Co. of Canada, Limited, Dept. M F Toronto.

The Late William Robertson.

The many friends of William Robertson, who for the past seventeen years has been the head herdsman on the well known stock farm of W. W. Black, Amherst, will learn with regret the news of his death, which occurred on Sunday morning, October 29th. The deceased was born in Scotland, but came to Canada when a young lad and for some years resided in Ontario, coming to Amherst as previously stated about seventeen years ago. A little over a month ago he was taken seriously ill with appendicitis, complications following, the necessary operation set in, which resulted in his death. He is survived by his wife and five children.

For the past fifteen years, the late Mr. Robertson has been a prominent figure at all the important exhibitions in the Maritime Provinces and more than once during that time he has led W. W. Black's magnificent herd to the coveted positions at Canada'a national exhibition at Toronto. Although of a quiet, modest, retiring disposition, the deceased was

After the Victory.

The Late Wm. Robertson posing one of his favorite prize winning steers at the Maritime Winter Fair.

in all respects a public spirited citizen and in his own unassuming way did much to advance agricultural and livestock interests in these provinces. A few years ago he read a paper to the Nova Scotia Farmers' Association on beef raising which was one of the most valuable contributions ever submitted to this gathering. He gave frankly and freely from his abundant store of knowledge and often by kindly words and keen oversight encouraged young exhibitors to greater efforts and ultimate success in the show ring. As a breeder and feeder of livestock he had no peer in these provinces and as an all round judge of animals few equals. Ever since the organization of the Maritime Winter Fair, he has been a prominent figure at these shows. He loved a keen contest and was always the first to extend the glad hand to the man who made him take second place. He was a friend of every lover of livestock in the Maritime Provinces and in many other parts of Canada. They all knew William Robertson and he won the respect and esteem of all, to each of them his untimely death is a personal loss. The livestock industry throughout these provinces has lost a great benefactor and his family a kind husband and loving father.

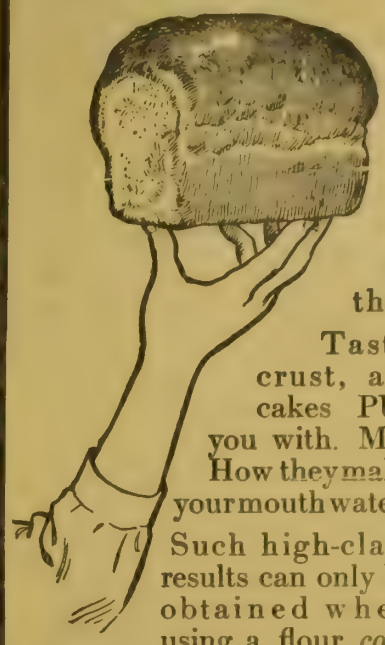
Be Fair. Buy a sack or barrel before judging PURITY FLOUR

SOME people have attempted to judge PURITY FLOUR before knowing the facts about it—before using it. So we ask you to be fair and to buy a sack or barrel of PURITY FLOUR and give it a thorough try-out before attempting to arrive at a judgment.



Look at the beauty and loftiness of the golden-crusted, snowy-crumbed loaves, fit for a king. Count them and see how many more of them PURITY yields to the barrel than ordinary flour does.

Taste the creamy, flaky pie crust, and the deliciously light cakes PURITY FLOUR rewards you with. My! How they make your mouth water!

Such high-class results can only be obtained when using a flour *consisting exclusively* of the *high-grade portions* of the *best Western hard wheat berries.*

And remember, that, on account of its *extra* strength and *extra* quality, PURITY FLOUR requires *more* water when making bread and *more* shortening when making pastry, than you are accustomed to use with ordinary flour.

PURITY FLOUR

"More bread and better bread"

Buy a bag or barrel of PURITY FLOUR. Test it for a week. Then pass judgment.

Add PURITY FLOUR to the grocery list right now.

N. B. Fruit Growers' Annual Convention

(Continued from page 97).

gett, strongly endorsed the idea and moved a resolution to the effect that the suggestion offered in Mr. Turney's Synopsis be referred to the Provincial Department of Agriculture for their support and that the arranging of details in connection with its enactment be left with the Department of Agriculture and the Executive of the Association.

Mr. Henry Wilmot, Treasurer of the Association read his report showing: Receipts $976.90; disbursements $927.76.

The matter of defining a standard size for No. 1 and No. 2 grades in the different varieties of apples was discussed by Tappan Adney and others. The question was referred to a Committee consisting of Messrs. Adney, Turney and Flewelling for future report.

THE FRUIT GROWERS' BANQUET was held on Tuesday evening, in the New Victoria Hotel, where upwards of sixty members and guests sat down to a bountiful repast, after which they listened until the wee sma' hours to toasts optimistically and eloquently responded to by W. Frank Hatheway, M. P. P., A. R. Slipp, M. P. P., Hon. Robert Maxwell, M. P. P., W. W. Hubbard, S. L. Peters, T. H. Estabrooks, President of the Board of Trade, Prof. Macoun, Dominion Horticulturist, Prof. W. S. Blair, Prof. P. J. Shaw, Dr. E. S. Kirkpatrick, formerly Trade Commissioner to Cuba, Wm. Gilman, A. G. Turney, Tappan Adney and C. N. Vroom.

ON WEDNESDAY.

The Fruit Growers' Association held three sessions on Wednesday, at all of which there was a good attendance. At the morning session there was a discussion on the question of having a standard size for No. 1 and No. 2 grade of apples in the various varieties, and an address by Professor Blair of Macdonald College on the planting and care of orchards. At the afternoon session there was an address by Prof. Macoun, Dominion horticulturist, on the question of selecting varieties suitable to conditions in the province, followed by a discussion on spraying. At the evening session Prof. Shaw of the Agricultural College at Truro, N. S., gave an interesting account of orcharding in the sister province, and an instructive discussion followed.

FRUIT MEN ASK FOR EXPERIMENTAL FARM.

A feature of the evening session was the introduction of the following resolution, moved by W. B. Gilman, seconded by J. W. Clark, which was carried unanimously.

"Whereas, it is of great importance to the development of fruit growing in the province that we should have greater and more definite information on the suitability of varieties, cultural methods and many points of orchard practice, such as can only be obtained by scientific investigation in the province; therefore be it resolved,

"That this Association request the Dominion Minister of Agriculture to establish as soon as possible under his department an experimental farm at some point in New Brunswick, typical of average provincial conditions, and that a copy of this resolution be sent to the Federal Minister of Agriculture."

PRACTICAL ASSISTANCE TO FARMERS.

The following resolution, introduced by Mr. Jas. Gilchrist was carried by an unanimous vote:

"In the opinion of this Fruit Growers' Association, the Department of Agriculture could render very great assistance to the fruit industry of this province, and farmers in general, by supplying sufficient horticulturists, at the proper season, to prune, graft and spray and give instructions generally. Farmers to care for such assistant, after his arrival in their respective localities, without cost to the department, and to pay such fee as may be fixed by the department from time to time."

OFFICERS ELECTED.

President—C. N. Vroom, St. Stephen.

Vice-president—S. L. Peters, Queenstown.

Secretary—A. G. Turney, Fredericton.

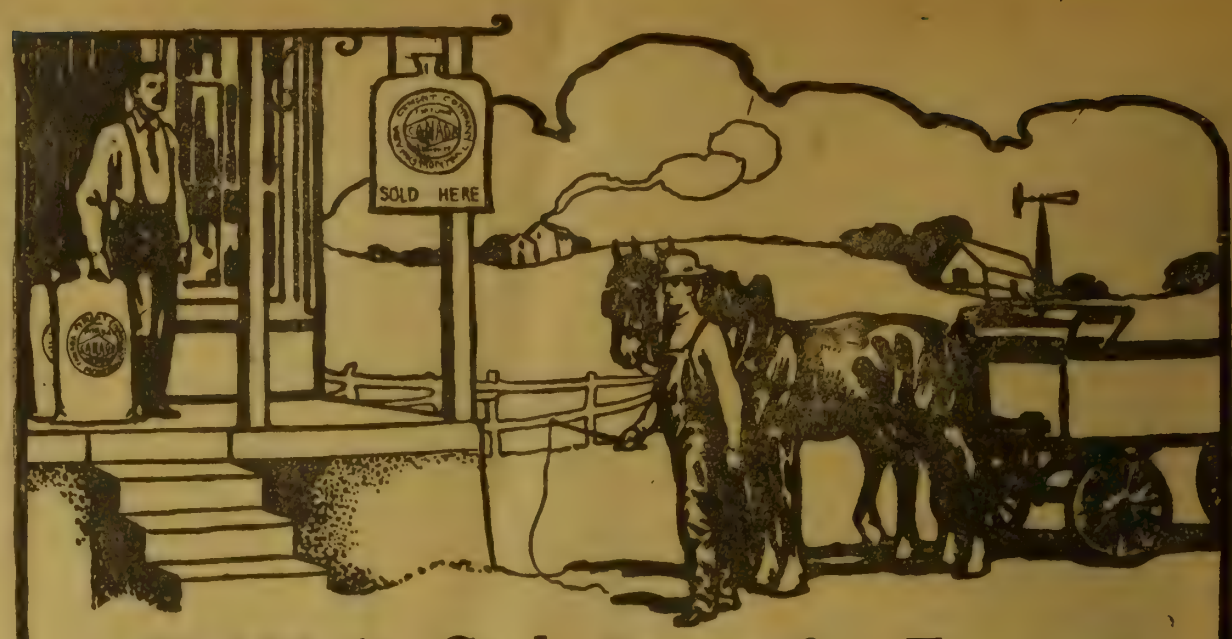
Treasurer—H. Wilmot, Oromocto.

County Directors:

Albert—W. A. Colpitts.
Carleton—Tappan Adney.
Charlotte—G. E. Martin.
Kings—N. W. Eveleigh.
Queens—W. P. Fox.
Northumberland—G. E. Fisher.
St. John—W. B. McFate.
Sunbury—J. W. Clark.
Westmorland—Benj. Charters.
York—W. B. Gilman.
Gloucester—B. J. Power.
Kent—H. W. B. Smith.
Restigouche—James E. Stewart.
Victoria—Donald Fraser, jr.

THURSDAY MORNING.

A demonstration in the proper system of the box packing of apples was given on Thursday morning after which the members of the Association went back to their farms and orchards resolved to do better in the future than they have ever done in the past.



$3,600 in Cash Prizes for Farmers

WHEN you enter the Canada Cement Prize Contest, your dealer will assist you. Consult him in reference to conditions of the contest. Refer all questions of doubt to him to decide. Confer with him when his experience and advice and his knowledge of our plan would seem helpful.

Don't hesitate about doing this. We have requested him to assist to the best of his ability any farmer in his locality competing in this contest—whether it's a matter involving the application of cement, or how to go about winning one of the prizes offered in this contest. Do you realize that you have as good a chance as the next man to win one of these prizes? There are four for each Province, as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911, the greatest number of bags of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who in 1911 uses "CANADA" Cement on his farm for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work shown by accompanying photograph, was done.

Contest will close on November 16th, 1911, and as soon as possible thereafter, prizes will be awarded.

Be sure and get a copy of our Contest Circular, telling all about the contest. Ask your dealer for one or use the attached coupon, if you find it more convenient.

In writing us, mention whether you have received your copy of "What the Farmer Can Do With Concrete," a profusely-illustrated 160-page book, which tells you how to build with concrete, so that you can do much of the work yourself. It's a mighty handy and useful book, and should save you many a dollar. Farmers who have received it, say it is splendid. Write to-night and it will go back to you with Prize Contest Folder, by return mail.

Please send Circular and Book.

Do You Shave Yourself?

If so, you no doubt have shaving troubles, as there isn't one man in fifty who knows how to strop his razor correctly, the almost invariable result is a rounded edge instead of a keen, sharp edge so necessary to a clean satisfactory shave.

MAIL ORDERS FILLED

BRANDT'S AUTOMATIC RAZOR STROPPER

"Makes every man an Expert." Does what no human hand can do.

It automatically sharpens the ordinary old style razor any size or make, and all kinds of safety razor blades including the Gillette, Ever-Ready, Durham-Duplex, Keen-Kutter, Enders, etc. It sharpens them better than the most expert barber can do it. In using the Brandt Automatic Stropper, you do not hold the razor while stropping. You cannot round your edge or cut your strop. The Brandt Automatic Stropper strops the razor for you. It requires no skill or experience. We invite any man who shaves himself to call at our store, and examine this celebrated stropper, and see how it does away with all stropping troubles.

SOLD AND ADVERTISED EVERYWHERE AT 3.50 **OUR PRICE $2.50 EACH**

Canadian Specialty Company,

P. O. Box 228 154 Prince William Street, SAINT JOHN, N.B.

MARKETS.

Market Review.

Seeds of all kinds will be scarce and high next spring. This is particularly true of clover and grass seeds. Present indications point to first-class red clover seed retailing at seed time at about 25 cents per pound; Alsike at round 20 cents per pound, and timothy at 18 cents to 20 cents. Alfalfa seed will probably sell for about 17 or 18 cents per pound and farmers who have their soil in good shape and who have been successful in growing Alfalfa on a limited scale will probably sow it more extensively next year. The present high prices are the result of the general scarcity not only in Canada but in the United States and Continental Europe as well. The English crop seems to be better than the European Continental crop and if it turns out fairly well the above prices may be some what modified.

The scarcity of seed is not confined to clover and grass seed. It will apply to all classes of grain as well, as so much of this year's crop was too light to serve for purposes of reproduction.

Hogs—Toronto, $6.75; Montreal, $6.60; Buffalo, $6.25.

Cattle—Toronto, $6.50; Montreal, $5.90; Buffalo, $9.00.

Lambs—Toronto, $5.40; Montreal, $5.50; Buffalo, $5.25.

Butter—Toronto, 27c.; Montreal, 27½c.; New York, 33½c.

Eggs—Toronto, 33c.; Montreal, 28c.; New York, 55c.

One or two explanations are necessary in dealing with the above table of comparative prices. The prices quoted for butter and eggs in Toronto are those prices which dealers are actually paying for produce shipped in, while the prices quoted for butter and eggs in New York are those at which commission houses sell produce and the commission charges must, of course be deducted therefrom. Even with full allowance for this it will be noticed that the New York price is very much above the Toronto level. Hogs are higher in Toronto and Montreal than in Buffalo.

HAY AND STRAW.

Hay is selling in Toronto at $18 to $22, and clover and mixed hay at $14 to $16. In New York prime hay is quoted at $1.35 per cwt., No. 1, $1.30 and No. 2, $1.20 to $1.25. Clover, mixed, $1.00. Straw is selling in Toronto for from $7.00 to $8.00, in the loose state to $15.50 and $16.50, baled. In St. John and Montreal loose straw is selling at $7.50 per ton. Baled, No. 1 hay is selling in St. John for $13.00 to $15.50, while the lowest figure in Montreal is $14.00. No. 2, hay ranges from $12 to $14.50. The highest figure for the same quality in Montreal is $14.00.

Clover Seed Crop.

The latese reports from the alsike districts of Ontario indicate that the quantity of seed produced this year will not exceed 50 per cent., or, at most, 55 per cent. of a normal crop. The general quality is inferior and in many cases is mixed with a proportion of white clover. The high prices offered for good quality red clover seed have induced farmers to gather seed from fields that would not be considered worth cutting under normal conditions. The red clover heads, wherever found are well filled with seed, and the yields per ton promise to be large. The estimate of the Dominion Seed Commissioner is that there will be 25 per cent. of a normal crop.

Large areas of timothy seed have been saved for seed in Eastern Canada. While a good deal of this seed caanot be made to grade No. 1, the greater part of it will be available for the retail trade. The very high price for timothy seed is due largely to a shortage in the seed producing centres which supply the Chicago market. Nine dollars per bushel for timothy seed is a price that few farmers can recall and their purchases this year are not likely to be very extensive. A great deal of perennial rye grass and orchard grass will doubtless be used to supplement timothy.

New Brunswick Potatoes For Cuba.

The indications are that the trade in New Brunswick potatoes with Cuba this year will be better than in previous seasons. The crop has been good, and the very favorable reputation which the New Brunswick article has attained in the Cuban market indicates that there will be an even heavier demand for them this winter than last year. Mr. Nelson Robertson of the firm of Stewart & Robertson, of Havana, was in the city this week, and he said that the New Brunswick potato was in a fair way to capture the great bulk of the Cuban business. If there is not a better trade this year than formerly it will be largely the fault of the steamship service which interferes with the success of the New Brunswick shipper. It is stated that a rate from Boston to Cuba can be obtained cheaper than from St. John to Cuba, and this places the Maine potato shipper who ships through Boston at an advantage over the New Brunswick shipper shipping through this port.

Charlottetown Prices.

GRAIN.

Oats, White, 40c. to 41c.; Black, 42c. to 44c.

FEEDSTUFFS

Bran, $27.00 to $29.00 per ton; Shorts, $28.50 to $30.00 per ton; Middlings, $29.00 to $30.00; Oil-cake, $2.25 to $2.60; Corn Meal, $1.85 to $1.95.

GRASS SEEDS

Timothy, 15c. lb.

LIVE STOCK

Butcher's Cattle, 5½c. to 8c. dressed weight; Stockers, $18 to $28.00; Milch Cows, $24 to $40.00; Sheep, live weight, 3c. lb.; Lambs, 3½c. to 3¾c.

DRESSED MEATS

Beef (carcass), 6c. to 9c.; Beef (retail), 8c. to 14c.; Mutton (retail), 8c. to 12c.; Mutton (carcass), 6¾c. to 8c.; Lamb (retail), 10c. to 12c.; Lamb (carcass), 7½c. to 8½c.; Pork (carcass) 6c. to 7½c.

HORSES

Drafters, $125 to $200.

DAIRY PRODUCTS

Creamery Butter, Solids 27c., Prints 28c.; Dairy Butter, tub, 20c. to 22c.; prints 22c. to 25c.; Cheese, 14½c.

POULTRY AND POULTRY PRODUCTS.

Eggs, 23c.; Fowl, 8c.; Chickens, 9c. to 11c.; Ducks, 12c.; Geese, 10c. to 12c.; Turkeys, none.

FRUIT

Apples, $2.00 to $3.50.

VEGETABLES

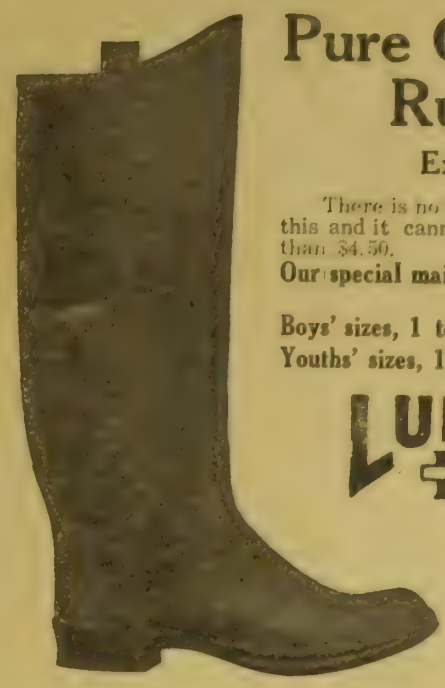
Carrots, 40c. per bushel; Potatoes, 30c. to 36c. per bushel; Turnips, 12c. to 14c. per bushel; Beets, 40c. per bushel; Parsnips, $1.00 per 100 lbs.; Cabbage, 50c. to 60c. per 100 lbs.

MISCELLANEOUS

Hay, $11.50 to $12.00 per ton; Straw, $5.00 to $6.00 per ton; Wool, 22c. to 23c. lb.; Beef Hides, 10c. lb.; Calf Skins, 14c. lb.; Sheep Skins, 50c. to 60c. each; Lamb Skins, 50c. to 60c. each; Oysters, $4.50 to $5.50 per bbl.

Market prices since last report has varied considerably, but on the whole prices are higher. Large quantities of potatoes have been shipped to Montreal and this has resulted in a good demand at fairly high prices, but just as we write the demand for shipping by sail is about over as shippers are not willing to take the risk of frost consequently market is easier, and demand not so good with result that prices are lower than a short time ago. Sydney market is slightly oversupplied and demand for shipment there is not so good as it was. Other vegetables have been in good demand at prices quoted except cabbage which seems to have been in larger supply than the markets we have could handle them and the demand for this line has been slow. Dressed Meats and Poultry are lower than a year ago. This is more particularly true with respect to lamb and mutton, but pork is also lower than last season, and it looks as if lamb and mutton at present prices should be good value. Oats are scarce and prices are firm and round lots might bring even higher prices than figures given. Hay in the immediate vicinity of the town is also a limited supply, and what is being shipped from here

BARGAINS!!



Pure Gum Rubber Boots

Extra Special

There is no better rubber boot made than this and it cannot be bought elsewhere less than $4.50.

Our special mail order price, . . . **$3.45**
Sizes 6 to 11.

"Sunnyside Stock farm," Sussex, N. B.

For Sale Cheap.

A Good Horse, trianed to work in woods or on farm, weight 1450. Only reason for selling—A large supply of Colts on hand.

T. M. TODD.
Narrows, Queens Co., N. B.

Is your husband cross? An irritable, fault finding disposition is often due to a disordered stomach. A always good natured. A great many man with good digestion is nearly have been permenently cured of stomach trouble by taking Chamberlain's Tablets. For sale by All Dealers.

comes mostly by rail from Prince County where the crop was much better than in the other parts of the Island. Supply of fresh gathered eggs has become very small and shipments now are mostly storage stock. Butter although quoted at high prices, elsewhere is not in brisk demand here and dairy is rather a drag, except for finest quality, but creamery butter is high and meets with ready sale. The cheese season is over and prices quoted are simply nominal. In fact we do not know of any stocks in factory men's hands and very few in the hands of wholesalers or jobbers. Trade in general has been good all fall and we feel that it will continue so until close of navigation.

Market Review.

FLOUR AND MILLFEED.

Save for a 50c. advance per hundred on car lots of Manitoba bran on Toronto market, both Montreal and Toronto prices for millfeeds show no other change. Demand is just as keen as heretofore, with a big scarcity of bran and shorts. It looks as if the improved condition in wheat and oats is going to affect the coarse grains, and now may be a good time for the farmer to stock up. Manitoba patents and strong bakers have all advanced 10c. at Toronto, but Montreal prices are firm at last week's quotations. It will be remembered that the present prices of Montreal markets on flours are 10 cents higher than they were two weeks ago, and Toronto prices are just following suit. All kinds of mill feeds and products are in keen demand, and there is no little difficulty being encountered in meeting demand.

BUTTER AND CHEESE.

It is hard to account for the advanced price of butter, unless we stick to the same old reason called "short supplies." It is evident that there is a shortage of milk supplies just now, and our butter business is beginning to feel the change, however slight. Up to recently supply and demand have remained balanced, but now the demand is slightly in excess. Even Winnipeg has felt the influence, and prices there show 1c. of a rise all through. English butter shows up on the fall, as conditions there are all for the consumption of process butters of the oleo order; also liberal shipments are being received. Cheese markets are not stirring much, and prices at the wholesale show no change, and the figures stand at last week's quotations.

HAY AND STRAW.

The demand for hay of any quality or kind continues to be keen, and export demand far exceeds the shippers' ability to fill. With hay so scarce in Canada in general, it seems rather suicidal to our own interests to allow the coarse feed to find shipboard. There will be an ample demand all winter for all the spare hay and straw that we have in the country. Our live stock must be fed, and turning the hay into beef will be a good thing this winter, because beef prices are going to be high, and also because whilst the feeding quality of our mixed and straight hay is fairly good, the fact that the color is bad has a tendency to reduce its marketable value. At any rate, a demand does not have to be satisfied if the holder has better things to do with his feed supply.

HOGS.

Hogs are on the rise! The hold-off on supplies at Toronto last week kept the packers from getting all they needed, and brought them to a unanimous conclusion that the farmer needs at least $6 a hundred when feed is so dear. This looks better, but whether this revival in price will hold good is doubtful, as immediate needs are now fully supplied. However, it is evident that no immediate break away is imminent. At Montreal the price advanced 40c., and on Monday morning large supplies arrived, but were well taken care of by the packers, and selects went off at a high figure. Buffalo hog prices have dropped about 25c., and Chicago figures show no advance. Whilst it has become the season for a swell in deliveries, it is evident that supplies are smaller than a year ago at most points in Canada.

BEANS AND PUMPKINS.

J. A. Gallant, of Mount Carmel recently marketed the product of half an acre of land. The half-acre was planted with beans and pumpkins, both occupying the same land. The beans, after being threshed with a flail, were sold in Summerside for about $90. The pumpkins—about 300 in all—were sold at 10 cents each, making the returns of the half-acre over $120. Although no place in the world can grow better beans than Prince Edward Island, yet thousands of bushels are imported from other countries. There is money in raising beans. Farmers should make a note of this item.

Shropshire Sheep SALE

45 Pure Bred Shropshire Sheep 45

At or near the

Winter Fair Building, Amherst

on

December 6th, 1911

At One o'clock Sharp

I will sell an entire flock of Shropshire sheep consisting of 29 ewes from one to five years old and 15 ewe lambs. Also the prize winning ram "Sultan" three years old. These sheep are well bred and in field condition. They will be sold to the highest bidder without reserve.

Champion Fruit Pickers.

Harry Coyle and Gordon McDonald two boys, are believed to be the champion apple pickers of the world. Last week they wagered $50 that they could pick fifty barrels in five hours. The bet was accepted and the contest was held on the farm of G. P. Ireland near Coborne, Ont. In four hours and seventeen minutes the fifty barrels were filled. The average time per barrel was 5 minutes 8 4-8 seconds.

P. E. I. Fruit Growers.

The P. E. I. Fruit Growers' Association are planning to hold their Annual Meeting and Winter Fair Show on Nov 29th, and 30th, so that delegates attending the Central Institute Convention on Nov. 28th, and 29th, can remain for the Fruit Show.

The boy's appetite is often the source of amazement. If you would have such an appetite take Chamberlain's Tablets. They not only create a healthy appetite, but strengthen the stomach and enable it to do its work naturally. For sale by All Dealers.

Milking Shorthorns

I have to offer, 5 Shorthorn Bulls, fit for service. Dams excellent milkers. Sire ¾ Cruikshank blood.

BLISS M. FAWCETT.
Sackville, New Brunswick.

Shorthorns For Sale

We have sold eight pure-breds and have a choice lot of roan and reds left, ages from 13 to 26 months. Also a large red bull, 3 years old.

C. C. H. EATON,
Canard, N. S.

ings, as branch wires can be run from the main line to the buildings and thus save wire and simplify the construction. Reference to Fig. 4, in which c, e, etc., represent the buildings to be connected, mn the main line and a and f the branch wires, will make this point clear.

POLES.

Poles twenty-two or twenty-five feet long of any good stock, cut when green, should be used. Cedar and chestnut are particularly desirable on account of their lasting qualities. The poles should be reasonably straight and well proportioned. The diameter

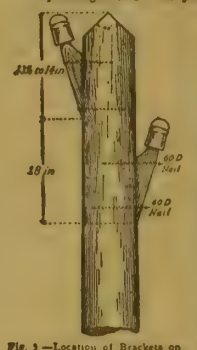

Fig. 5—Location of Brackets on Pole for Straight Lines.

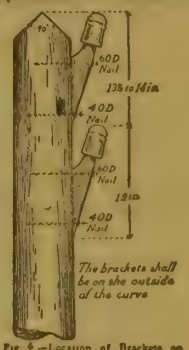

Fig. 6—Location of Brackets on Pole at Curves.

of the top of the pole should be about 5 or 6 inches. In order to prolong the life of the poles and add to their attractiveness, all the bark should be removed, knots trimmed close and the butt cut off square. The top of the poles should be roofed as shown in Fig. 5.

POLE FITTINGS.

Where only one or two line wires are to be mounted on the poles, oak brackets fitted with glass insulators are fastened to the pole as indicated in Fig. 5 for straight lines, or as shown in Fig. 6 at curves. The brackets should be attached to the poles before the poles are raised.

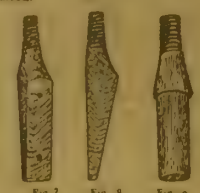

Fig 7 Fig 8 Fig 9

BRACKETS.

Brackets Figs. 7 and 8 are usually made of oak and given two coats of metallic paint and have a thread on the upper end to which is fastened a glass insulator, a type, as used in telephone work, is shown in Fig. 32.

They should be about 18 inches apart. The upper bracket should be 8 inches from the top of the pole

WE Send This VOLUME FREE BUT ONLY ON REQUEST

THIS book consists of 100 solid pages of carefully compiled information on the building of rural telephone lines. It is well printed, profusely illustrated and handsomely bound in stiff, cloth-covered binding. Apart entirely from its actual cost of printing and binding, the preparation of the technical matter in it has run into a great deal of money. That is why we ask for the coupon —we want to be sure that you are interested in the subject, before we go to the expense of sending you this book dealing with

The Complete Story of "How to Build Rural Telephone Lines"—Use the Coupon

The two pages shown above give you an idea of how thoroughly this book covers every detail. Every other page in the book is just as full of information as the pages shown. Among the matters dealt with in this volume, is the organization of mutual-companies, of stock-companies, line construction, equipment, costs of construction, companies already organized, their history and what they have accomplished, government regulations on the subject—in fact, every detail you could possibly think of or need to know. If there is no telephone system in your community to-day, it is only a matter of time until there will be one. Farmers are organizing community-owned systems all over the country. Some day one will be organized in your locality. You owe it to yourself to know the facts, for knowing the facts may mean money to you. Send for the book—use the coupon NOW.

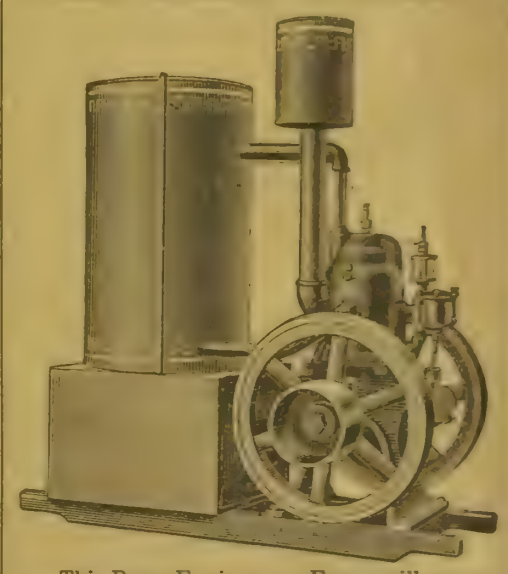
Page Work Engines

Since our first advertisement appeared a month or so ago giving particulars and prices of our engines, we have had many orders. People seem to readily realize that they cannot afford to go without an engine at prices we make—a 3 1-2 horse power at $138. or a six horse power engine for $188. The engines use for fuel either gasoline or kerosene. These engines are powerful but light and can be carried from place to place where work is to be done.

You may be wishing you had an engine to help you do your work, but may be unfamiliar with engines and have an idea that a gasoline engine is an uncertain, complicated thing. If you think so your fears are groundless, for gasoline engines are so developed nowadays as to be just as reliable as any other machine. Anyone can operate a gasoline engine, as there is no danger. No engineer is needed. There is nothing to blow up. Simply put gasoline or kerosene in the fuel tank and give the fly wheel a turn and away she goes for all day. Go off and leave it if you want to. It is safe.

A gasoline engine is started instantly. You do not have to wait to get up steam. When you are through work stop the engine and, and consumption of fuel stops at once. Hence, you can run the engine for only ten minutes, and you use only the fuel required for operating it that length of time.

As to cost of fuel, a Page engine uses only 7-8 of a pint of gasoline or kerosene per horse power per hour. Hence, if you were operating our 3 1-2—4 horse power it would use less than 1-2 gallon per hour, which at 15c per gallon would cost you only about 7 1-2c per hour. Probably you would not work the engine to its limit and fuel would be less accordingly, for a gasoline engine uses fuel only in proportion to the work it is doing.



This Page Engine on a Farm will pump, saw wood, run a cream separator, washing machine, churn, silage cutter, fanning mill, root cutter, grindstone, etc. It may be easily moved from one place to another, and is always ready to run. It does the laborious and tedious chores of the farm.

We are getting many orders from the Maritime Provinces, especially from Prince Edward Island, although Nova Scotia and New Brunswick are not far behind. Dealers find the Page engines a good line to handle as they are so low in price and so high in quality. We are getting so many applications for agency that we hope to have a thorough organization in the engine branch of our business in the near future.

Marine Engines

We have in above referred particularly to stationary or work engines. But we are also supplying marine engines from 2 to 36 horse power. Catalogue of either style on request.

The Universal Favorite

Is a High-class Family Steel Range, honorably built of the best material, and put together as tight as a steam boiler, and is guaranteed to cook and bake perfectly.

NOTE:—The spacious fire box for wood.
The large fire box opening, 7½x8½ inches.
The roomy square oven.
The top-hinged key plate.
Also note how easily the coal grates can be removed.
The linings can be changed from coal to wood, or vice versa, without the disturbing of a bolt.

There are thousands of Universal Favorites in the homes of our farmers, making cooking and baking a pleasure and the kitchen work easy and light.

THE UNIVERSAL FAVORITE is specially built to meet the requirements of farm homes. The top is large and roomy with six pot holes, the oven will bake sixteen loaves of bread in pans 4 1-2x10 inches at one time. The fire box for wood is 29 inches long, and will burn coarse wood of any kind

NO RISK IS TAKEN, as an unqualified guarantee goes with every UNIVERSAL FAVORITE that it will cook and bake perfectly.

The Universal Favorite is procurable from a dealer in your market town. Manufactured by,—

Volume 17. ST. JOHN, NEW BRUNSWICK, NOVEMBER 28, 1911. Number 4.

A Few Hints Re Dynamite on the Farm.

Time and Money Saving.

By B. H. Morrison.

MANY farmers who read articles which appear under titles similar to the above, seldom connect the facts stated therein with their own personal needs, and if they do, it is only in a visionary way, and seldom is the knowledge gained ever put to practical use. In this article we wish to give not only a few ideas of what can be done on the farm with explosives, but a simple and clear explanation as well of the proper way in which they should be carried out.

Ask the average farmer if he has any use for explosives on his farm and he will tell you "No," but then he does not know the many uses to which it can be applied. Without any doubt in our minds we would estimate that ninety-nine farmers out of every hundred in Upper and Eastern Canada, can use explosives on their farms to great advantage.

In the farming sections of fifteen states in the Republic to our south, and Ontario, Quebec, New Brunswick and Nova Scotia in our owncountry, we have seen various kinds of dynamites used on the farms for stump blasting, boulder breaking, tree planting, deep ploughing in orchards, hardpan blasting, subsoiling clay lands, log splitting, for digging ditches, post holes, wells, cellars and reservoirs, and for draining swamps, road making and grading.

Removing Stumps by Hand, a Slow, Expensive and Partial Process.

The big horizontal roots remain for years and cause plowing and cultivation to be done with difficulty and needless expense, breaking plow points and harness and injuring man and beast.

Now to give a complete description of the methods pursued in all the above uses, would take up too much space, so we will only treat on three or four of the principal ones. With that knowledge any farmer would be able to see how the others should be done, as many of them are very similar.

First let us take up stump blasting, the oldest use to which explosives have been put on the farm, or the farm in the making, we should say. Until a man has the stumps out of his land he should not call his place a farm, or at least should not expect it to return him the maximum interest on his investments, for every stump is a dead expense on his hands, but this is another question altogether.

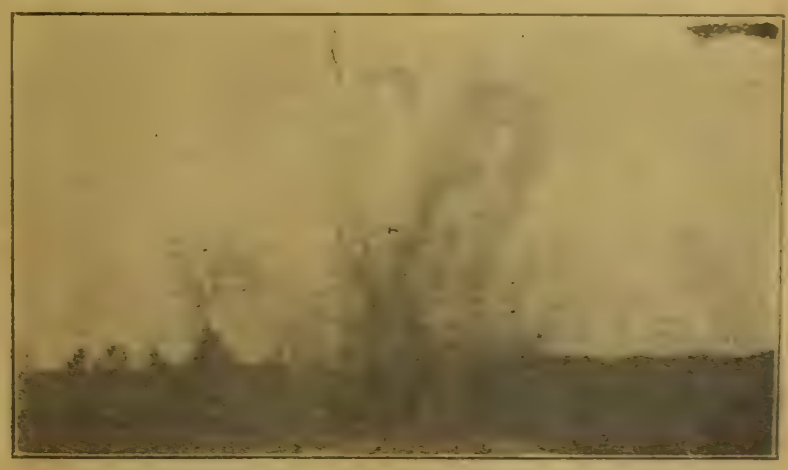
Stumps should be blasted in preference to burning or grubbing, not only because it is cheaper, but when a stump is burnt out, the ground about it is also burnt and takes years to bring back into workable condition. With grubbing, the whole stump has still to be dealt with when it is out of the ground. It is almost as much in the way as when it was in tne ground. In both these latter ways the big roots are left in the ground also—making ploughing a difficult matter. By using dynamite the stump is not only blown out and broken up, but the ground is all loosened ready for the plough.

All the tools needed for stump blasting are usually found on every farm, an auger four or five feet long with 2½ inch or 3 inch barrel, a crowbar, and a long handled round point shovel complete the kit. The explosives necessary are some stumping powder, which is used entirely for all farm work, Safety Fuse, No. 6 caps and a pair of cap crimpers.

To blow out a stump, first bore a hole under it, starting about six inches lrom the base in the dirt. The hole should be on an angle from thirty to forty degrees and should be at least as deep as the stump is wide, going beyond the centre of it a foot or more. The hole must be bored from the weak to the strong side, and the charge placed under the point of greatest resistance. The size of the powder charge depends on the condition and size of the stump, and also the kind of ground in which it has grown. Stumps in clay land take about three quarters of a pound to the foot in diameter, and in sand or loam about one pound to the foot. It is hard to give any exact figure on these amounts, as stumps vary so widely, but the above will serve for a rough estimate, and a farmer will soon find out from a few experimental shots, exactly how much his particular stumps require.

The stumping Powder is put up in sticks eight inches by one and a quarter, weighing about one half pound each. To place a charge of say eight sticks under a stump, the following instructions should be followed. Split each stick several times with a knife, putting them in the hole one at a timef As each stick is put in, it should be firmly packed with a

Placing One Half a Pound of Dynamite—Snake Hole System.



Once a Big Stump, now Kindling Wood.

wooden tamper, the handle of the shovel serving the purpose admirably. The powder must be packed tightly in the holes and no danger is experienced from pressing it firmly with the wooden tamping rod. After six sticks are thus packed in the bottom of the hole, then the stick containing the cap and fuse is pushed in as the others were, being split also to make it pack better, then the last stick is put in on top of the "Primer" stick as the others were. The hole must then be filled with dirt, it being put in a handful at a time and each firmly packed until the hole is full to the collar.

In preparing the "Primer" which is the stick containing the cap and fuse, first the cap must be pushed on the end of the fuse, and crimped on with a pair of cap crimpers, then the capped fuse is inserted into the side or end of the stick of powder, until the cap is buried, and then firmly tied in place with a piece of string. In loading shots the fuse should not be cut off until after the hole is tamped. Fuse burns at the rate of about thirty seconds to the foot, which gives lots of time to get away from a shot as every charge usually has from two to three feet attached to it.

There was never a stump grown that dynamite or Stumping powder would not lift out, but it must be used in sufficient quantities, and the charges located in the right place. It is always cheaper to use one stick too much than one stick too little. A good shot will lift the stump out of the ground and all the roots, and the stump will be broken into six or eight pieces. This result can be obtained by an expert every time but a raw beginner must expect that some of his first shots will be failures or at least they will not all be perfect shots.

It might be well to state here the chief causes of failures in stump blasting:—

First, the position of the hole. It must be along the line of greatest resistance.

Second, the depth of the hole. It must be as long or longer than the diameter of the stump at the base.

Third, the size of the charge. Sufficient must be used.

Fourth, placing the charge and tamping. The powder must be firmly packed so that all the air is expelled from the hole, and the tamping must be rammed even tighter. Over a charge of two sticks there should be about twelve inches of tamping and a charge of eight or ten sticks needs about eighteen inches or more. Two feet of tamping is sufficient for the biggest charges put under stumps. We have seen charges under big green stumps of thirty and forty cartridges, but this large amount is seldom necessary.

Another use to which explosives have been put for some years, and one which many farmers are conversant with, is that of breaking up and removing rocks and boulders.

This is a simple operation, a person only needing to know how to gauge his charges. Drilling a rock is seldom necessary, as the biggest boulders found in a field can be broken by placing the charge on top of them and covering it with mud, or by placing the charged under them in holes, similar to blowing out a stump.

Now, all boulders cannot be treated in this way with satisfactory results. Take for instances a large boulder, say, six or seven feet thick and buried in the ground, it would be better to place the charge directly under the centre of this, for then it would not only break the boulder but would lift it out of the hole as well. If this boulder had been mudcapped, as a charge on top is called, it would only have cracked it and would still be troublesome to get out of the way.

Mudcapping is the easiest way of breaking boulders, as there is nothing to do but to place three, four, or as many sticks of stumping powder as is required, side by side on the top of the rock, having a fuse and cap in any one of them, and then covering them all up with a shovel full of damp clay or muck. This mudcapping is best suited to boulders and rocks lying on the surface or buried only a foot or two. It uses considerable quantities of powder but is cheaper when the time and labor saved in drilling, are considered.

Now comes the sub-soiling of clay lands, and the breaking up of hard pan by the use of explosives. Both might be termed "new uses" but not untested nor untried, for sufficient time has passed since they were first put into use to prove their wonderful merits. In sub-soiling charges of one quarter pound of Stumping Powder are placed in holes two and half feet deep, and ten or twelve feet apart. The holes are well tamped and the fuse lighted as in other operations. These charges going off have the effect of breaking and cracking the hard clay all over the space worked on, allowing better drainage to a crop growing on it and also permitting the solution of valuable plant food which it contained and which previously had been inaccessible.

This breaking up of hard soil has been known to increase the yield of a crop twenty and thirty per cent the first year in which the money expended will be more than made up, and then the effect on the ground lasts for many years.

The only difference between this operation and that of breaking up of hard pan, is that the depth of the holes in the latter case must be governed by the depth of the hard pan, the holes going at least two-thirds through it, being tamped and loaded in the usual way. This will break up the hard streak and allow it to be worked properly. No land having a layer of hard pan under it can be expected to withstand prolonged drought or wet seasons, but by following the above instructions any hard pan can be so broken up that it will not be perceptible and crops will flourish on what was often barren land. This breaking up of hard pan is done to a great extent in the fruit sections of California where the land is underlaid with about a twelve inch strata.

Next we will describe tree planting and deep ploughing in orchards. The former is by no means a new idea. We have in mind several instances where trees twenty-five years old were originally planted this way, and now it is such a common thing that all the big orchardmen of the States are on the traveller's lists of the powder companies, to be called on as regular customers, and they are. We know of one peach grower in Georgia who uses regularly from two to three thousand pounds a year.

The advantages gained in planting trees with Stumping Powder, are many, time and economy being the smallest in our opinion of any, for it is best to take time and go to some expense to set out a tree properly, and make sure of it living and growing to be strong and healthy, rather than rushing the job and planting the tree in a hole where it has to fight for its life, and if it does live will be puny and a poor producer.

Comparative tests have shown and proven beyond doubt that trees planted in dynamited holes have the smallest percentage of failures, that they bear fruit from one to two years sooner, that they resist droughts and wet spells better, and that they are stronger and healthier in every way than trees which were planted in spade dug holes.

A Little Fellow "Blown Clean."

The system followed is similar to sub-soiling, a hole being made about two or two and a half feet deep with an auger or bar, and a charge of one quarter pound of stumping powder placed in it, with fuse and cap. It must be tamped but not necessarily hard, eighteen inches of dirt on top of the charge being sufficient. When this is exploded it will be found that on removing a few shovels full of loose dirt, that a large pot-hole has been created. The loose dirt around the sides falls in here and then the hole is ready for the tree. Any person seeing one of these dynamited holes, cannot help but see the great advantages over the old way.

Deep ploughing in orchards is just another form of sub-soiling, the holes being made on four sides of a tree under the end of the spread of the branches and from four to five feet deep. A charge of one half pound at least, should be used and firmly tamped. This loosens up the ground at the end of the roots, allowing them to penetrate deeper and more readily in search of new feeding grounds, and as the fumes from the powder are poisonous to animal life, it kills the grubs and lavae that feed on the roots. Also it provides reservoirs under the roots for the storage of moisture.

An orchard treated this way is not affected by a prolonged drought, granting, of course, that it has been done in the Fall or early Spring, and the fruit will be a better and finer quality.

Now, the other uses we mentioned for explosives on the farm, are nearly all offshoots of the ones described except perhaps log splitting, which is done by boring a hole in the log and placing in it a small charge, one eighth or one quarter pound and tamping with clay. In road making, well digging, etc., money can be saved by the judicious placing of charges in stiff clay for loosening it up, and by breaking up and blowing rocks out of the way.

The Government Agricultural Schools in the United States, have tested and adopted all of the above described uses for explosives, and we hope soon to see the Canadian Schools doing the same, for, in our opinion, a knowledge of the use of explosives is as essential to the progressive farmer, as is the rotation of crops or the proper method of ploughing.

There are doubtless a few points which we have not described, but there are explosive companies in Canada to-day which have men travelling from town to town, demonstrating the practical uses of their products, and which also publish hand books on explosives for farmers, for free distribution, describing every detail minutely.

Editor's Note:—We would like to hear from some of our farmer readers who have used dynamite or blasting powder in their farm clearing operations.

Twentieth Century Methods, Quick, Cheap and Complete.

The tree with all it's roots is blown from the ground, the earth is areated and pulverized to a depth of 2½ ft. on the average and an immense crop growth is possible!

The Pile of Stumps and Roots Ready to Burn, After Dynamiting.

Note how they have been splintered by the blast, also how free from dirt. The blasting process saves the labor of cleaning the dirt off the stumps, and hauling the stumps to out-of-the-way corners where they would be idly rotting and giving nothing to the soil.

First Prize Essays at Port Elgin Fair.

A Commendable Feature.

How to Keep the Boys on the Farm.

How will we keep the boys on the farm? is the problem before the farmers of this country to-day. It is a well known fact that one, at least, of every farmer's sons should stay and run the farm, but the question is, which one should stay?

Generally the smartest or the one who shows the most desire for an education is given a thorough College education, which would cost in the vicinity of two thousand dollars, and is therefore fitted for a doctor, lawyer or whatever profession he wishes to follow.

While the one who does nat show any desire for a higher education is put on a poor exhausted farm and is expected to cultivate and build up agriculture in the community in which he lives, with little or no education to help him along.

His life is all drudgery, because he does everything by hand, and has not the knowledge or ability to seek out easier methods which would make his farming operations and transactions a success and a pleasure to himself and the rest of the family. And all because he was deprived of an education.

Many are asking the same question. How can we encourage the young men to remain on the farm? If you want to make a good farmer of one or all of your sons, do not give the smart ones the advantage, and put the one who is not as smart on the farm, because you think he has not sense enough to be anything but a farmer.

That is the greatest mistake a man can make, and the worst thing he can do to his son. To put him on a farm without first giving him a good agricultural education is not very encouraging to the young man, especially if it be a poor run out farm.

As the boys of to-day reach manhood and think over their future life work, it must be confessed that to many of them farming does not present itself in a very favorable light. Their idea of it might be summed up in the epitaph found on the tombstone of a Minnesota farmer which read: "John Walker, born 1819. Spent his life doing chores." 1897, stopped doing chores."

So "to keep the boy on the farm" the first thing you should do is to get him interested in the business management of the stock and farm. And to do this successfully give him a young animal of some kind and tell him to feed it and care for it nimself, and when it is ready for market he can have the money received for it.

He will take more pride in his work if he thinks he is doing it for himself, and he will soon learn its ways and habits, and the feed it likes best.

When the animal is ready for market and he receives what it is worth, you can see him in your imagination chuckle and laugh over the money he received for his work and worry while tending the animal.

But, do not take it from him it would break his heart and weaken his confidence in you. It would never do you any good, and for him it might mean the nest egg in his future bank book. It also might be the means of driving him from the farm, never to return.

Do not keep him tied home from one end of the year to the other, give him a holiday once in a while. Allow him to go to a picnic, ball-game, horse-race and so on occasionally, and he will work better afterwards and try to make up for lost time. So in the long run you will be further ahead.

You should encourage him to invest his money in live stock of some sort. Perhaps he will choose pure-bred sheep, if he does let him get them, for I believe there is no more profitable stock on the farm than a good flock of sheep.

Then if you see that he wants to take up farming as a profession give him a good agricultural course at some good agricultural college that will fit him to master every problem connected with a farm and its stock, (and there are many for a young farmer to contend with).

You might ask where can a boy get the desired education along those particular branches. That question is easily answered, there is a good Agricultural College in Truro, N. S., which is prepared to give such a course to the young men of the Maritime Provinces.

Having given him such a course he will come back to the farm qualified to take up any branch of agriculture, and will take a greater interest in his work and the planning and managing of the farm operations.

Some boys who are brought up on a farm take no interest whatever in the farm, simply do their work because they have to. Those boys are under the impression that they are working for others and therefore take no interest in their work. To my mind it would be a good plan to take the boys into partnership with you when they get to be say about twenty years of age.

Encourage the boys to have a team of their own. But do not approve of trotting horses, as there is no profit in that stock for a farmer.

When you go to an Exhibition, Agricultural Meeting or a Fat Stock Show do not make him stay at home Show do not make him stay at home, remember more than you will yourself.

And afterwards when he expresses his opinion when he sees you doing something not just as he would do it, do not laugh at his way of thinking, even though it may not be just right, it showed his interest.—J. Roy Sweeney.

Agriculture as a Profession—How Best to Prepare for it.

Agriculture is the leading industry in this province to-day, consequently the farmer has the hardest but the best profession to learn. In the first place the farmer nearly always owns his farm and buildings.

He can raise nearly all he consumes on the farm and that of the very best quality. This is one of the instances where he has the advantage over the city folks.

But how many farmers realize the advantage of living on a farm? The farmer is a free man, he is his own boss, and he can regulate his work to suit himself. He has a home that he can call his own. How many of his less fortunate fellow-men can boast of that. He lives in the purity of God's pure air, while those in the city are continually breathing all kinds of impure and diseased air.

Generally speaking as the boys of to-day reach manhood, many of them drift over into the New England States, Western Canada, and indeed into every part of the continent, generally doing themselves and their native Province credit. Many of the others who remained on the farm have drifted into side lines, such as fishing, and lumbering, consequently the farm being more or less neglected, yields still smaller returns.

While I believe it pays to farm thoroughly and systematically, it certainly does not pay to farm indifferently. There is no season of the year in which a farmer cannot find profitable employment on his farm, and it is one of the farmer's individual problems to find out and arrange his line of work.

If agriculture is allowed to go down no other industry will thrive in this country. Therefore agriculture may be termed the back-bone of every industry. The young men brought up in towns and cities are given an education to fit them for whatever profession they wish to follow. So also should the farmer receive an education to fit him for his profession. But how many receive such an education? Not one out of fifty, you say. A farmer certainly can get a practical educatioo (providing he works at his profession long enough) but it will take time. Where if he had a good Agricultural education he could go right ahead and know what he was doing.

Start two men out together at the age of twenty-one years, give one a two thousand dollar education and the other a two thousand dollar farm and see how they stand at the age of fifty. The one who has received the education will go to work in a store or office as book keeper and perhaps in time will get to be head bookkeeper. At a salary of perhaps one thousand dollars a year. But there he stays, he can go no higher unless he goes into business for himself and that requires a good deal of capital.

He gets married, rents a house and raises a family. When the bills are paid, rest assured he does not have very much to add to his bank account. At the age of fifty he will retire, not because he is rich enough to take things easy for the rest of his life, but because his position is filled by a younger man. Whgt is he going to do? There is the question.

But the farmer who started out when he did. How is he progressing? At the age of fifty he retires too, and lets his sons run the farm. He has been a prosperous farmer and can now take things easy. So when you consider the cost of living in the city compared with the country, and the advantages the farmer has over all other professions, it can be easily seen that agriculture is the most profitable profession that any young man in Canada can take up.

How to prepare for it is the next question to be considered. In the first place start the agriculturist when a boy if he takes an interest in live stock and farming operations in general. He should have at least a common school education. And if circumstances will permit he should go through hign scnool. He will then be able to manage the business part of farming.

But there is something else he must have before he can be termed a scientific farmer, and that is a good Agricultural Education. If he can afford it he should take a two years' course at one of the Agricultural Colleges in Canada.

There is an Institution at Truro called the N. S. A. C. which is prepared to educate the young men of the Maritime Provinces in all the principal series of Agriculture and Animal Husbandry.

This course is regulated to suit the farmer. It is carried on in the winter months when the farmer is not busy. This Institution can give an all round education in Scientific Agriculture, English, Mathmatics that no other College in the Maritime Provinces can give.

When the young man gets through College and gets fairly started, he should get married to a good sensible farmer's daughter.

In the last few years the city working man has been crying out of hard times, and the cost of living so high. The city people are the consumers of farm produce and they have to be fed. It is hoped that farm produce will go still higher and compell the working man of the city to come back to the country and take up some of the vacant farms which they over looked in their young days.

So to my mind the young man who chooses agriculture as a profession is a wise man because farming is not what it was twenty-five years ago when markets were poor and there were no machinery to lighten the labor. It was in those days that so many young men left the farm to make an easier living, as they thought But times have changed, the farm today stand at the head of all other professions, and it is no longer termed the "old hayseed."—J. Roy Sweeney.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

PRIZE ESSAYS.

On other pages of this issue, our readers will find the essays that won first prizes at the Port Elgin Fair last fall. The subjects were well chosen and the essays show that considerable care and study were exercised in preparing them. Referring to these essays, in a recent issue of the Maritime Farmer, Professor Cummings of the Nova Scotia Agricultural College, said :

"It gives me a great deal of pleasure to "commend the management of the Port "Elgin, New Brunswick Exhibition in "awarding prizes for the best essays on "agricultural subjects entered for com- "petition at their fall Exhibition. Those "essays were forwarded to me at Truro, and "I have just completed reading and award- "ing prizes upon them. This feature of "the Exhibition Prize List was, I believe, "inaugurated last year. At any rate, I ex- "amined a similar series of papers a year "ago. I am pleased to notice that this year, "there are not only more competitors, but "the quality of the essays written is quite "superior. I will be very much surprised "if tangible results do not follow this ef- "fort to interest the younger people of New "Brunswick in writting essays upon sug- "gestive agricultural topics.

"In this year's competition, there were "three separate sections, prizes being "awarded for the best essay in section 1.— "How to keep the boys on the farm." "Section 2—"Agriculture as a profession ; "how best to prepare for it." Section 3 - "A kitchen garden on every farm ; What "to grow in it and how to cultivate it."

"It was my only regret, in examining "these essays that I had only nine prizes "to award and could not award merited "prizes to the number of extra essays over "and above those provided for.

"I thoroughly believe that it would pay "other Exhibition Commissions to follow "the example of the management at Port "Elgin and adopt this commendatory "feature. Those who are interested in "doing all they can to awaken the interests, "especially of the young people, in matters "agriculturally, would do well to corres- "pond in regard to this competition with "Mr. J. R. Taylor, Secretary Port Elgin "Exhibition Little Shemogue, Westmor- "land County, N. B.

LAST CALL TO THE MARITIME WINTER FAIR.

Ere the first December issue of the Maritime Farmer reaches our readers, the Eleventh Annual Maritime Winter Fair will have been held. The Fair will open in Winter Fair Building, Amherst, N. S., on December forth. and will continue for four days. Not a moment of the four days will be wasted. When a farmer visits the fair he is given every opportunity to inspect the various classes of fat cattle, sheep, swine and poultry. He will also visit the dressed poultry, beef, mutton and pork departments, the honey department and the selected seeds department. The foremost seed selectors of the Maritime Provinces will be there with their oats, wheat, barley, buckwheat, potatoes, timothy clover and other seeds. There will also be collections of fruit from each county in the Maritime Provinces. From each one of these departments, the visitor can gleam some ideas that will well repay him for visiting the Fair.

If he stands near the stock judging rings he will see the various animals as they are led out to be judjed. He will have an opportunity to contrast the merits of the different individuals in each class, and if he is so disposed, and wishes to settle any question of doubt that may exist in his own mind in regard to the various classes after the judges have placed their awards, he is at liberty to ask any questions in regard thereto and he will receive a courteous reply.

The dairy department will not be open to the public until the ofternoon of December fifth, as the cows that will be entered in the milk test must not be disturbed. A dairy cow is of a highly strung nervous temperament and the constant rush of throngs of people through the stables would not be conducive to a large yield of milk and butter fat. As each and every breeder is anxious to get his cows to make the best possible showing the dairy department will be the "holy of holies" until the test is completed when the record of each cow will be posted and the public will be allowed to inspect them as much as they choose. The evenings will be profitably spent in listening to instructive addresses, in the large, comfortable auditorium, by prominent agriculturists. The bee men, the poultry men, the seed men and various other associations will hold their annual meetings in the fair building and they will welcome interested parties to their respective meetings. It will do you good to take a few days vacation and visit the fair. The railway rates are so cheap that it would be extravagance to walk. In behalf of the Maritime Stock Breeder's Association, under whose auspices the fair is held—we extend to each and every one of our readers a cordial invitation to visit the fair. Don't forget the dates, December 4th, 5th, 6th and 7th, 1911.

THE N. S. A. C. SHORT COURSES.

The Nova Scotia Agricultural College, Truro, N. S., is an institution that has been built by the Nova Scotia Government, in response to popular demand, for the purpose of giving the young men of the Mayflower province, who wish to make agriculture their life study and work a chance to acquire the scientific knowledge that is so essential to successful practice.

Although the college is wholly supported by the Nova Scotia Government, its doors are thrown open to the boys and girls of the other maritime provinces. Not a few of the bright young men of New Brunswick and Prince Edward Island have taken the opportunities offered, by a course at the college. Some of these, like their Nova Scotia classmates have gone back to the farm where they are giving a good account of their stewardship, while others have taken more extensive courses in other agricultural colleges and are now filling important positions in every part of Canada and the United States, and some have even been called to work in foreign fields. The unamious verdict of each and every student who has even attended the college is that it is as good as the best. Students who have graduated from the Truro college at the end of the two-years course have entered the third year in some older institutions in competition with students who have taken their first two years at the better seats of learning. The N. S. A. C. Students have, on more than one occasion, been successful in leading their classes in point of general average and total aggregate.

The provinces of New Brunswick and Prince Edward Island as well as the province of Nova Scotia needs a lot of agricultural research work. The finances of the two former provinces is not in as flourishing a state as would warrant the building and equipping of provincial agricultural colleges, although no one disputes the fact that the money required for this work could not be spent to a better advantage.

Why cannot Prince Edward Island and New Brunswick co-operate in maintaining an interprovincial college by helping the Nova Scotia Government make the college at Truro bigger and better ? The staff could be increased, more demonstrative work could be carried on and the effects would be far reaching.

The short courses at the Truro college will open on January 2nd, 1912. A cordial invitation is extended to New Brunswick and Prince Edward Island men and women, boys and girls to attend these courses. The farmers of Nova Scotia have been been greatly benefited by the work that is being done at the college. The New Brunswick department for Agriculture will pay the travelling expenses of any New Brunswick boy or girl who will attend the short courses. Prince Edward Island also assists students who go from the Island province to Truro.

Tution is free and board can be procured at a nominal figure.

A Kitchen Garden on Every Farm.

In writing of the Kitchen Garden it seems to me the small fruits are inseparable from the main annual garden. A good poultry wire fence (if hens are permitted to run) around a small plot of rich ground, preferably handy the house is the first necessity.

This I would have longer than wide so the plow and cultivator could be run and room in the end for turning horse.

At one side of plot I would have my gooseberry, currant and raspberry bushes, next a bed each of sage mint, horseradish and chives.

The remainder would be divided into four parts, 1st quarter, early potatoes; 2nd quarter, newly set strawberry plants; 3rd quarter, 2nd year strawberry plants; 4th quarter, garden.

I plant my garden on old strawberry ground, potatoes on last year garden ground and strawberries on potatoe ground.

The first year strawberry blossoms are nipped off, and the runners allowed to grow. These are used for next year's plants. Second year the blossoms are left and the runners kept back so that all the vitality of the plants go to fruit. After plants are two years old they are plowed up.

My rhubarb is covered in fall with strawy manure, plowed in spring close to roots, then plowed crossways thinning out the roots.

Early in spring when the ground around the gooseberries and currants is worked up, I plant my parsnips between the bushes, then I can leave as many as I choose in the ground over winter. Thus when I cultivate my parsnips it keeps a mulch around my bushes which would probably have to go without were it not for these.

In the plot allotted to garden, I would have my radish, lettuce, early onions, celery, tomatoes, cucumbers, pumpkins, squash and citrons.

The outside row would be onions, as they only want earth worked up about two inches. Radish and lettuce is put in with well rotted manure in rows. For cucumbers and other vines I open a deep furrow fill with horse manure compost (fresh horse manure mixed half and half with earth early in spring or late the preceeding fall) turn into rows and plant seeds.

I prefer this method of planting to beds as the cultivator can be run through them until they blossom, keeping a mulch to hold the moisture and the cucumbers are more easily picked without injuring the vines.

Tomatoes and celery are started in house early in spring and set out in trenches. As the tomato spreads its roots very near the surface of the ground, I plant it in a hollow and draw the earth gradually around the stem as it grows taller thus getting the root down deep so it gets more moisture. The sides of the trench also break the wind and do away witn the need of shingles.

Celery is grown the same as tomatoes, but in the fal banked up to bleach the stems.

As every good farmer does not have his grain and potatoes in the same place continually so I would not have my main garden always in one place. Besides the fact that some plants need one element of soil fertility and soon exhaust that in the land the cut worm has worked havoc where I had garden continuously in one place.

When the men prepare the potato and turnip land in the fall I get some manure spread and worked in for my garden next year. In the spring when the potato land is worked up I have my garden harrowed and made into rows. For beets no more manure is applied in spring but for other things a light dressing of manure is beneficial. The manure is placed in centre of row.

A stake stuck into the bottom and top of row with cord drawn tight between enables me to plant things straight. In this way I plant carrots, beets, summer savory and transplant cabbage and cauliflowers. It is more pleasure to see a garden coming up in straight rows than crooked and less seed will do as none is wasted by cultivator.

For beans, peas, corn and broadbeans I run a home made marker along guiding cord then plant seeds in marked row and cover with hoe or a scratch with cultivator with hillers attached.

If a garden is put in in this way the cultivating is very much simplified. A cultivator run through the rows after each shower or, if dry weather each week, will hasten growth by preserving the moisture and keeping the weeds down.

When plants are ready to hoe and thin I spread a little nitrite of soda around each plant and mix with earth.

I might add that if our garden is on clover sod or oat stubble weeds are more easily kept in check also I leave carrots and beets quite thick when first thinning them and thin out as I use them in fall thus preventing them from getting too large and I think they are better quality when smaller.

Get seeds from some reliable seedsmen or better still put some of the best roots of each kind in the cellar with earth and leaves on and next year grow our own seed, as almost all seeds except cauliflower can be grown at home.

A part of row each of nasturtiums, sweet peas, asters and mignonette keeps the house in cut flowers and is a nice addition to a vegetable garden.

To make the ordinary hoe twice as easy to work with, cut the upper corners off and sharpen very sharp.—Mrs. Thos. Aulton.

Editor's Note:—The foregoing article on "A Kitchen Garden on Every Farm" was the first prize essay on this subject at the Port Elgin Exhibition last fall. We take pleasure in bringing this subject to the attention of our readers and we trust it will be the means of creating a more general interest in the all important Kitchen Garden.

Gardrum Prince.

Sire of the heifers, Bonnie Jean and Gardrum Snowstorm, shown in the other photo on this page. Champion Ayrshire bull at the 1911 Fredericton Exhibition. Bred by Hugh Montgomery Esq., Newlands Farm, Ayrshire, Scotland. Imported and owned by Retson Bros., East Court Farm, Truro, N. S.

Utilizing Dormant Natural Resources.

Editor Maritime Farmer:—

In your last issue I read a report, by T. E. Martin, of an average yield of 418 bushels potatoes per acre on an 18 acre field. I have also read, in the Farm Journal, another report of 500 bushels from one acre in Carbondale, Colorado.

These reports seem like fairy tales or fish stories to the farmer who is content with 150 or 200 bushels per acre and considers it a good crop.

To the above good results I wish to add a report of my own potato yields, right here in New Brunswick. In 1908 I produced 52 bushels of Carmen No. 1 potatoes from 12 square rods, which is equal to 676 bushels per acre. In 1909 I dug 43 bushels from tne same plot, which equals a yield of 559 bushels to the acre. This year, I dug 580 qushels fron one and one-quarter acres, making an average of 464 bushels.

In the results of 1908-9 no commercial fertilizer was used. The ground was well supplied with a composition of green fish, green bone, tankage, hard wood ashes and black muck. A liberal dressing of muck was also spread in the rows after the seeds were dropped. After the potatoes were dug, I plowed under a liberal dressing of barn yard manure. In 1909, no fertilizer of any kind was used.

The potatoes were sprayed three times each year. The muck used contains a little over 2 per cent of ammonia with slight traces of potash and phosphoric acid. This year's crop was grown on ground half of which had a heavy crop of clover plowed under last fall. A dressing of muck had been applied before the clover seed was sown. On the other half of the ground, which produced a crop of buckwneat the previous year, I used at the rate of 300 pounds of Bowker's potato fertilizer. The crop on the muck and clover patch was fully one-third better than where the fertilizer was used. One check row, where no fertilizer was used, was almost a failure, there being very few potatoes of marketable size. My potato yields are not credited around here except by those who have seen the plots.

I do not believe we have nearly reached the possible in potato culture and I am pressing on for better results. I believe the small yields of potatoes in New Brunswick are due to lack of careful cultivation, improper selection of seed and neglecting to spray rather than to a lack of plant food.

I am delighted with your report of the progress made in fruit growing in New Brunswick. It proves my theory of the absolute necessity for demonstrative instruction in agriculture.

I hope you are right in the prophecy "The cry from Macedonia will not be in vain." A most urgent cry from the eastern part af Macedonia has been before the throne of grace, at Fredericton for nearly four years for assistance in demonstration work, but so far it has not been recognized.

While I do not believe that the importance of fruit growing and pure

(Continued on page 131).

A Trio of Prize Winners

Gardrum Wee Nan, 3 years old; Gardrum Bonnie Jean, 2 years old; Gar drum Snowstorm, 1 year old, winners of three first, two second and 3 third prizes at the 1911 exhibitions. Bred by the late Geo. Retson, Esq., Scotland, Imported, owned and exhibited by Retson Bros., East Court Farm, Truro, N. S.

SUFFERED TERRIBLE PAINS OF INDIGESTION.

MILBURN'S LAXA-LIVER PILLS CURED HER.

Mrs. Wm. H. MacEwen, Mount Tryon, P.E.I., writes:—"For more than a year I suffered with all the terrible pains of indigestion, and my life was one of the greatest misery. It did not seem to make any difference whether I ate or not, the pains were always there, accompanied by a severe bloating and belching of wind. I did not even get relief at night, and sometimes hardly got a bit of sleep. In my misery I tried many remedies said to cure indigestion, but they did me not one particle of good, and I fully expected I would always be afflicted in this way. At this time my brother came home on a visit and urged me to try Milburn's Laxa-Liver Pills, and got me a few vials. By the time I had taken one vial I began to improve, and could eat with some relish. I was greatly cheered, and continued taking the pills until all traces of the trouble had disappeared, and I could once more eat all kinds of food without the slightest inconvenience. I am so fully convinced of their virtue as a family medicine, I have no hesitation in recommending them."

Price, 25 cents per vial or 5 vials for $1.00 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

HORTICULTURE.

Pollination of Fruits.

More than 100 years ago (about 1793) the German botanist, Sprengel, published a book in which he showed as a result of his observations the part insects play in the pollination of flowers. This work, many statements of which have been disputed, proved a stimulus for further work and observations in pollination of fruits. Sprengel himself probably did not understand how important cross-pollination is in nature.

Later, Andrew Knight, in England, carried on experiments in cross and self-fertilization of the pea, which showed that it was probably intended in nature that plants should be cross-fertilized.

Darwin was the first to establish clearly the true value of cross and show the interesting modifications of plants to aid in cross-pollination. In Darwin's "Origin of Species," cross-fertilization is especially emphasized. But it was not until some time later that much attention was paid to his theories.

M. B. Waite, of the Department of Agriculture, Washington, conducted some very valuable work with apples and pears about twelve years ago. Since that time many experiment stations and a few individuals have made systematic studies of this and many other plant-breeding problems.

Many plants are sterile, as far as their own pollen is concerned, but will readily respond to pollen from othet plabts. Some fifty plants are known to be thus self-sterile, but they will bear fruit if pollenized witn pollen from other plants. C. I. Lewis of the Oregon Experiment Station, Corvallis, Ore., has found that out of eighty-seven varieties of apples worked with, fifty-nine varieties were self-fertile, fifteen self-sterile, and thirteen varieties partially self-fertile.

Many varieties naturally tend to be sterile when limited to their own pollen and a knowledge of these is important in pollination work. A sterile variety is one that will not fertilize its ovule with its own pollen; the pollen of a fertile variety will do this. Investigators have found that climatic conditions affect the sterility and fertility of varieties, so that tests must be made in different climates.

The method employed to test this is to enclose the blossoms in Manila bags before they open, thus preventing any outside pollen from entering the flowers; and if the blossoms fail to set fruit after the pollen has been distributed on the stigmas, the flowers are said to be self-sterile.

Among self-sterile varieties of apples, according to Lewis, are Early Strawberry, Gravenstein, Haas, Jonathan, McMahon White, Pewaukee, Rome Beauty, Salome, Polman, Sweet Transcendent Crab, Wealthy and York Imperial.

Self-fertile: Baldwin, Grimes Golden Duchess, Scott's Winter, Shiawassee and Yellow Newtown.

Partly self-fertile: Ben Davis, Whitney and Yellow Transparent.

It has been found that certain varieties make better pollenizers of varieties than others. For example, better results were obtained by crossing Spitzenberg with either Janathan or Baldwin than with Newtown, and very much better than when self-pollenized. In determining the pollenizers for any variety, we must choose those tnat blossom at the same time as the one to be pollenized, and they should bear a large quantity of pollen, although it is not essential.

In planting an orchard, it is well to set alternately about two rows of a variety that is weak in pollen, and then two rows of one strong in pollen, etc. They must be close enough so that insects will visit each easily. Wind has been found to be a poor conductor of orchard pollen.

The floral envelopes of flowers tend to attract bees and insects, but they quite readily visit flowers not having conspicuous floral envelopes or where the envelopes are gone.

Climatic conditions have considerable influence on the blooming periods of fruits. In cold, frosty localities, varieties should be selected in reference to their blooming periods, and success will more often result.

The length of time that pollen will keep varies. It may safely be kept two or three weeks, and even longer if not allowed to ferment.

In the work of cross-pollenizing at Corwallis, it was shown that immediate effects of pollen on color of fruit were seen. Also the crossed apples were heavier, and the seed was also heavier. Many of the self-sterile varieties when self-pollenated were found to be seedless or had small seeds. When the self-fertile varieties were cross-pollenized, an improvement in size was noted.—Southern Fruit Grower.

Orange Rust.

Some sections have been badly struck with orange rust this year. Where prevalent it is the worst enemy of the blackberry and raspberry. It is widely distributed and is known in localities all over the continent.

In the early spring the under sides of the leaves of blackberries and raspberries often present a red or orange color. In every case it will be found that plants so attacked are much retarded in growth. The leaves are distorted, tend to curl, and take on a languid appearance.

Another stage of the same disease is often overlooked by the casual observer. It precedes the red rust by some weeks, and appears on the upper side of the leaves, and may be found the time the leaves unfold.

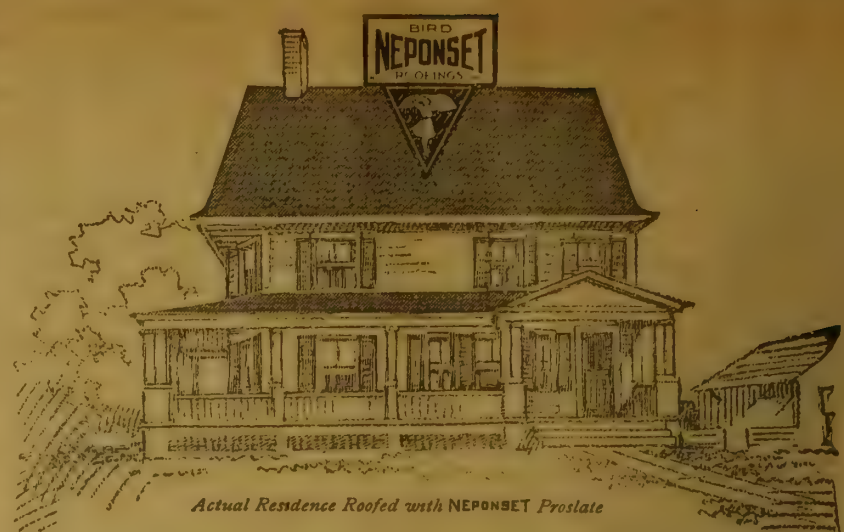
When a plant is once attacked nothing may be done to save it. The mycelium is within the tissue, and lives there from year to year during the life of the plant. Spraying is useless. Remove and burn all affected plants. They are of no value, and a great nuisance to all healthy plants.

Picking Apples.

A very great mistake is often made by picking winter apples too early. Not only is the fruit smaller in size, poorer in flavor and color, but it will not keep nearly as well as if it is allowed to ripen, nor will it be nearly as satisfactory to the customer. I know some very fine apples were almost ruined last fall by picking them too soon. When we pick before the fruit is ripe, we don't stop by having fruit of inferior quality, but we are certain to destroy a great many of the fruit buds already formed for the following season's crop. This is because the apples cling so tenaciously to the trees. There is very little danger of losing apples from heavy winds in the fall before they are ripe. I have often seen limbs torn from trees and carried 30 or 40 feet and yet be full of apples. Pick when fruit will separate from bearing twig without breaking stem of fruit. —J. H. B., N. J.

Apples for Germany.

A big trade with Germany in Nova Scotia apples has been opened up this season. Hitherto the apple exports from Halifax have been exclusively to London, Liverpool and Glasgow but chiefly to London. The British ports already this fall have taken about half a million barrels. Hamburg for the first time has taken apples from Nova Scotia province the exports so far this season being about eighty thousand barrels and shipments will continue. The German steamer Helent Mouzel which sailed October 28, for Hamburg, took 30,110 barrels. The Elder-Dempster steamer Canada Cape, which sailed for South Africa took 3,150 barrels.



Actual Residence Roofed with NEPONSET *Proslate*

Looks Like Stained Shingles

Why don't you roof youf home with this modern roofing material? It is more than a substitute for shingles because it resists fire.

NEPONSET

PROSLATE ROOFING

The Real Rival of Best Shingles, which Adds Fire Protection

It makes as attractive an appearance as stained shingles, but it can't catch fire from sparks or burning embers. It is bound to give permanent wear because it is made with NEPONSET Paroid as a body. And NEPONSET Paroid has proved permanent in every climate.

NEPONSET Proslate lasts longer than the best shingles that you can buy and costs much less. This modern idea roofing material combines fine appearance, long wear, fire resistance, moderate cost.

Write for all the facts and for name of the NEPONSET *dealer.*

HOLIDAY GIFTS

AS everyone knows, December is a busy month, busy for everybody preparing for Yule Tide time.

AVOID THE RUSH. Thousands of people let their Christmas shopping go to the last week when the rush and hum is at the highest point. Why not avoid all this bustle and confusion and **do it now?** Do not wait till the last minute before sending us your order. We make this appeal to you now so that you will avoid all anxiety and worry and receive **"all"** your purchases in plenty of time for Christmas.

WE CAN GIVE YOU PROMPT, ACCURATE AND EFFICIENT SERVICE NOW

Think this over; "why wait?" Take our large Catalogue, which has thousands of suggestions, make your selections and send us your order now and feel relieved for once regarding your Christmas gifts. **"DO IT NOW."**

THE T. EATON CO LIMITED
TORONTO CANADA

For a Maritime College of Agriculture

The provinces of New Brunswick and Prince Edward Island as well as the province of Nova Scotia needs a lot of agricultural research work. The finances of these two former provinces is not in as flourishing a state as would warrant the building and equipping of Provincial Agricultural Colleges, although no one disputes the fact that the money required for this work could not be spent to a better advantage.

Why can not Prince Edward Island and New Brunswick co-operate in maintaining an interprovincial college by helping the Nova Scotia government make the college, at Truro bigger and better? The staff could be increased, more demonstration work could be carried on and the effects would be far reaching.

The short courses at the Truro College will open on January 2nd, 1912. A cordial invitation is extended to New Brunswick and Prince Edward Island men and women, boys and girls to attend these courses. The farmers of Nova Scotia have been greatly benefited by the work that is being done at the College. The New Brunswick Department for Agriculture will pay the travelling expenses of any New Brunswick boy or girl who will attend the short courses. Prince Edward Island also assists students who go from the Island Province to Truro.

We know of no better way to interest a boy in the farm work than by allowing him to attend the Short courses at the Nova Scotia Agriculture College. Co-mingling with his fellow students from all parts of Maritime Canada will so enthuse him that the instructions so ably dispensed by Professor Cumming and his efficient staff will never be forgotten. Will you attend the 1912 Short Courses? Now is the time to act.

A druggist can obtain an imitation of MINARD'S LINIMENT from a Toronto house at a very low price, and have it labeled his own product.

This greasy imitation is the poorest one we have yet seen of the many that every Tom, Dick and Harry has tried to introduce.

Ask for MINARD'S and you will get it.

DAIRYING.

Cost of Milk Production.

Principal Dunstan, of the Agricultural College at Wye, Kent Co., England, has given out the results of an inquiry into the cost of winter feeding in milk production. He notes, as the chief factors in the cost the following: Food, litter, labor in feeding, attendance and milking, illness, calving risks, depreciation in value of cow, interest on capital, expenses (carriage, etc.) on sale of milk; while the returns are sale of milk, value of calf, and value of manure. Mr. Dunstan calls atte attention to the necessity for keeping individual milk records, and also of making a close study of the kinds and quantities of food that will enable a cow profitably to maintain her maximum of production as long as possible. Upon 66 farms, carrying 2,097 cows, it was found that the average cost of food per day during the period the cows were in milk was under 1s. on ten farms; from 1s. to 1s. 3d. on twenty-one farms; from 1s. 3d. to 1s. 6d. on twenty-three farms; and over 1s. 6d. in feeding on some farms. The cost per day was 7.8d., the highest 24.1d., and the average 14.88d. These figures show what wide variation there is in the cost of keep, and call attention to what must be extravagance in feeding on some farms! The cost of producing a gallon of milk on 59 farms was next considered. It was 6d. per gallon on 18 farms, from 6d. to 7d. on 11 farms, 7d. to 8d. on 17 farms, and over 8d. on 13 farms. The lowest cost per gallon was 3.83d., the highest 10.54d., and the average 6.58d. Mr. Dunstan points out that high feeding is not necessarily remunerative. In certain cases, where newly-calved cows are brought in, forced during their milking period, and then sold fat, the feeding has a double object, which is not that of an ordinary milk-producer. In such cases the high feeding may be justified, but in the case of an ordinary dairy cow, which is not a mere penny-in-the-slot machine, in which the more penny-worths of food you put in, the more gallons of milk you take out, it is necessary to find out her point of economical productiveness and keep her at that. When, however, the results (cost of food per day and per gallon) are combined, the inference is reached that, with a high milk yield, the cost of production of a gallon of milk is less than with a low milk yield. When the basic factor was the cost of food per gallon of milk, on 59 farms, with 1,924 cows, there was a variation all the way from 4.4d. to 9.2d. It is shown that the cost of food per gallon of milk is influenced more by the cost of the daily ration fed to the cow than by tke decrease in milk yield.

An examination of the figures from 60 farms and 2,038 cows shows that where an average quantity, 20.3 lbs. of hay was used on 22 farms and 519 cows, the daily cost of the cows' ration was 17.4d., and the cost of production of a gallon of milk 7.77d.; whereas, on 30 farms (1,324 cows), where the average quantity of hay was 7.8 pounds, these figures were 13d. and 6.16d., respectively, a reduction of 25 per cent. and 22.3 per cent, respectively. It is probable that the dairy farmer would get equally satisfactory milk yields, at a reduction of cost, if less long hay were fed, and if the bulky fodder consisted of sound straw and chop, with a foddering once a day of long hay.

In the case of concentrated foods, undoubtedly too much reliance is placed on the effects of these foods on both quantity and quality of milk yield, and too little accurate knowledge is obtained of the individuality and capabilities of the cow. Given a cow whose performances at the pail, as evidenced by the fat content and weight of her yield, are unsatisfactory, no amount of high feeding will make a substantial difference in these respects, and the money spent in concentrated foodstuffs will be wasted, unless her previous feeding has been ill-balanced and uneconomical. It is, of course, an axiom in the feeding of dairy stock with concentrated foods, that such foods should be reduced in quantity, according to the decline in the milk yield.

CONCLUSIONS.

Summing up the conclusions from this preliminary inquiry, the following points are worth consideration:

1. The exceedingly wide variation (a) in the cost of the daily ration fed; (b) in the cost of production per gallon of milk.

2. The relatively small number of farms on which it is a regular practice accurately to record milk yields (18 farms out of 60).

3. The unnecessarily large quantities of hay and roots which are fed (13 farms were found to feed more than 100 pounds of roots per cow per day).

It is not to be expected that a ration in the form of a "prescription" can be advocated, as one suitable for all cattle, all soils, and all conditions. Each man must judge for himself the foods which he can utilize to the best advantage and calculate the cost of his daily ration, watching his cows to ascertain whether the live weight is being greatly increased or decreased. But all this care will be of little use, unless the farmer at the same time keeps a record by daily or weekly weighing of the milk yield of each cow in his herd; and this practice cannot too often be insisted upon, as not only does the farmer thereby know which cows are profitable, but by saving calves from these cows got by a bull of good milking strain, he can improve the milk yield of his herd, and consequently his own profits, without any extra expenditure on food stuffs, merely causing a very little extra labor, which is, after the custom of weighing has been in force for a week or so, negligible, and which stimulates the milkers to a beneficial rivalry in comparing the performances of the cows with which they have to deal.

Mold on The Butter.

It is a well-known fact that mold-infected butter becomes unsalable in a comparatively short time, and involves not only heavy financial losses and unpleasant business relations, but also a serious loss of prestige and standing on the market of the person or firm who make and sell such butter. It is important, therefore, that everyone who handles butter, either as a manufacturer, or as a dealer, should know something about the nature of mold. He should know the conditions which are favorable and those which are unfavorable to its growth. Such knowledge will enable him not only to successfully check the scourge when present, but also prevent its further growth.

Science tells us that mold is a plant, though of a very low order. Like other plants, it grows from seed called spores. Mold spores, like many other micro-organisms, abound in the air around us, and, given favorable conditions and a suitable medium, they will settle and grow. Settle they will under favorable conditions, but unless they find a moist surface to rest upon, they are likely to be carried up again by aerial currents and will not grow. Dampness, bad ventilation, medium temperatures and absence of light favors the growth of mold, but the opposite conditions, i. e., dryness, good ventilation, high temperatures and light will retard or even stop its growth. If, and when, dryness, good ventilation, high temperatures and light are

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

WINDSOR TABLE SALT

Salt goes in or on practically everything we eat—which shows the importance of using only pure, wholesome salt.

Windsor Table Salt is pure salt—all salt—and nothing but salt. It is the standby in all Canadian homes. 35

Your grocer is sure to have it.

The "Able Bodied"

SHARPLES

Tubular Cream Separator

Two farm "hands" ask you for a place. One is able bodied. The other uses a crutch. Which will you hire?

Two kinds of cream separators are looking for a place on your farm. One is the "able bodied" Dairy Tubular, built on a modern, patented principle, with twice the skimming force of others, and free from disks.

The others are built on an old style principle—they lack skimming force—they must use a crutch in the shape of disks or other contraptions.

Which kind for you?

The "able bodied" Tubular, of course. Write for catalog 194.

Minard's Liniment Co., Limited

present, and given the proper application in creamery work, the buttermaker need not worry very much about mold or its effects. Dryness, good ventilation and light in any work-room add greatly to the comfort and pleasure of the workers, so there should be no need of specially urging anyone to apply these conditions in creamery work for the purpose merely of preventing the growth of mold. These conditions should also be provided in the places used for storing supplies, such as salt, packages, parchment paper, etc. The use of lime for whitewashing walls and ceilings, and for scrubbing wooden utensils and floors, will be found very helpful in keeping the creamery and utensils in a sanitary condition, free from mold.

The high temperatures spoken of may be employed in the form of boiling water, with or without the addition of lime or washing soda, for the final scalding of floors and utensils, and also in the daily re-boiling of the brine in which the parchment liners and print wrappers are prepared. In this connection, let me refer you to note 10, attached to a copy of dairy-inspection form, which reads: All parchment liners and wrappers prepared by being immersed for at least six hours in a solution of salt, re-boiled each time fresh waters are put in; butter-box material to receive a thin, even coating of paraffin wax, and to be carefully nailed. All boxes to be thoroughly rinsed out and lined before using.

Lack of cleanliness in the place where it was made is undoubtedly the most frequent cause of mold in or on butter, or it may be to carelessness in the storing and preparation of the packages—boxes, parchment paper, and coverings—prior to using. A frequent, thorough and critical inspection of the work and storage rooms and utensils at the creamery will reveal the presence of mold before it gets a chance to do much damage. Knowing how to combat it, the person in charge must shoulder the responsibility of dealing with it promptly and vigorously. In the light of what we have said in the foregoing, the following recommendations are made respecting the care and preparation of butter packages:

1. The material used in the making of butter boxes should be dry and well seasoned, and the boxes stored in a dry, clean and well-ventilated storage. The inner surface of every box should be evenly coated with paraffin wax. The jute bags, where such are used for covering the butter packages in shipment, and the parchment paper-box liners, and print wrappers, should also be stored in a dry, clean, and well-ventilated place.

2. The parchment papers should be immersed for at least six hours before using in a receptacle containing brine made of salt and water—just strong enough to float a potato. The brine should be re-boiled after a fresh batch of paper is put into it, in order to destroy by heat any mold spores adhering to the paper. An indurated fibre tub is about the best thing to use for boiling the brine in which the parchment paper is prepared.—C. Marker, Dairy Commissioner for Alberta.

The authorities never advise using buttermilk for a culture or starter. They say, use a culture which you know has a clean, pleasant, sharp acid flavor and smell, which may consist of a pint or two of sour cream from your previous churning, or the same amount of good flavored skim milk.

It is claimed if the above method is followed the product would be an article second to none, and one that would command a price that well pays for the little trouble expended in following the instructions.—Dr. Ward.

A Matchless Christmas Gift

The GILLETTE SAFETY RAZOR

No Stropping! No Honing!

For the man who shaves, you couldn't select a more acceptable gift than this world-famous razor. Progressive men everywhere are using it.

The "No Honing—No Stropping" feature makes a hit with every shaving man. Few can strop a razor right. The Gillette doesn't need it.

Standard Sets $5.00 with 12 double-edged blades

The Gillette is absolutely safe. You can shave as fast as you like. Your shave is perfect—clean, quick, safe and economical. The Gillette is *adjustable*—for a light or a close shave.

Ask your dealer to show you the different styles of Gillettes. If he has not the goods or our catalogue, write us. We will see that you are supplied.

Pocket Editions, $5.00 to $6.00.

Combination Sets, $6.50 up.

Guernsey Cows' Records of Performance

We have the following records from Howard W. Corning, M. P. P., Hillside Farm, Yarmouth County, N. S., who is the youngest member in the Nova Scotia Legislative Assembly, and one of the most progressive dairy farmers in the Maritime Provinces. Mr. Corning is a breeder of pure bred Guernseys and his herd is always quite prominent at the fall fairs.

The cost of food consumed by the Guernsey cows that qualified in the Record of Performance was charged as follows:—Hay, $10.00 per ton; turnips, 10 cents per bushel; pasture, $2.00 per month and market prices for all grain feed consumed. The calves, skimmilk and manure are not credited in these records but are left to offset labor, interest on investment and depreciation on buildings and stock.

How many of our farmer readers keep track of their cows in this way?

The Tested Sire.

A short time ago I visited a dairyman who has a large five-year-old bull of excellent breeding and some of his get give every promise of developing into splendid individuals.

TRAMPED 60 MILES TO SAVE HIS CHUM

Prospector at Larder Lake Got Back with GIN PILLS Just in Time.

LARDER LAKE, ONT., MARCH 26th, 1911.

"I am writing to tell you the good GIN PILLS did me. I had been suffering for some time with my Kidneys and Urine. I was constantly passing water which was very scanty, sometimes as many as thirty times a day. Each time, the pain was something awful and no rest at night. I began to feel worn out. I heard of your GIN PILLS and decided to give them a trial at once. I sent my chum out to get them (about 60 miles) —and I am pleased to inform you that in less than six hours, I felt relief. In two days, the pain had left me altogether. I took about half a box and to-day I feel as well as ever and my kidneys are acting quite natural again. Thanking you for the pills which I always intend to keep by me. Yours respectfully,

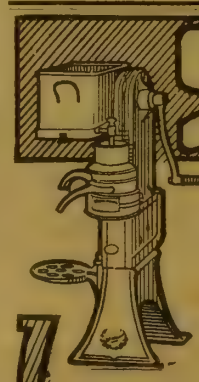
SID CASTLEMAN.

WELCOME RELIEF.

We have never received a letter that pleased us more than this one. When we realize what Gin Pills meant to this sick man, lying on a bed of pain miles away from a doctor in the frozen north, and how they helped him, we feel that our efforts to prepare a standard preparation for Kidney and Bladder Troubles have been crowned with success.

GIN PILLS is a wonderful solvent for uric acid. It instantly neutralizes the hot, scalding urine, allays the burning pain, soothes the irritated bladder and heals the kidneys. Take GIN PILLS on our positive guarantee of a cure or your money back. 50c. a box, 6 for $2.50. Free sample, if you write mentioning this paper, The National Drug & Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS are a positive cure for Constipation, Biliousness, Sick Headache and Sour Stomach. Excellent for Indigestion. 25c. a box. 112



STANDARD CREAM SEPARATOR

PAQUET FURS

The Connecting Link Between Trapper and YOU

CANADA'S Largest Fur Factory is the connecting link between the Trapper and YOU. Here we manufacture the famous PAQUET FURS, which are recognized as the Standard of Quality from Halifax to Vancouver.

And when we say "manufacture" we mean just that. We do not buy the skins ready dressed and dyed, and make them up at an enormous expense which you must help to pay. If we did, we'd have nothing unusual to talk about. We buy the skins in the raw—dress them and dye them ourselves—and then make them up in our own workrooms. This is the ONLY Fur Factory in AMERICA where every processes, from dressing of the raw skins to the finishing of the Fur Piece or Garment, is in operation under the one roof.

We employ only the most modern process of dyeing and finishing. Every member of our vast army of workers is an expert in his line.

This Handsome Fur Catalogue

containing 80 pages of illustrations and prices of PAQUET FURS, will be sent to you FREE upon request. This is the most beautiful Fur catalogue ever published in Canada.

Write NOW !

This is because Fur has been to their fathers and grandfathers what it is to them—a life study. It stands to reason that with all our advantages we should turn out the very best Furs on the Canadian market, doesn't it ? And that we do is testified to by the thousands of Canadians who have spent to date more than EIGHT MILLION DOLLARS for PAQUET FURS. Quite a tidy little sum, isn't it ?

And what's more, every one of these purchasers is a satisfied customer.

In the past PAQUET FURS have been sold through the leading fur stores of Canada. The demand has now reached a point where more adequate distributing facilities are an absolute necessity. For this reason we have decided upon this new policy of selling direct to YOU at actual wholesale prices. This will enable us to keep our immense Fur Factory running at full capacity all the year round. It will also enable YOU to buy your furs at the lowest prices ever known in Canada.

Examine Them FREE

You don't need to send one cent in advance. Choose your Furs from our 80 page Fur Catalogue and we will send them PREPAID, for Free Examination to any Express Office in Canada. Pay the Express Agent our Catalogue Price and they are yours.

The Set Illustrated $25.00

No. 6145—Lady's "Olympic" Stole in Black Russian Lynx (perfect imitation of genuine Black Lynx), lined with plain Satin; Special **$12.50**

No. 2102—Lady's "Teddy" Muff to match, Black Russian Lynx, Satin lined, Special **$12.50**

He told me he will put the old bull away, as he is getting ugly and dangerous about the place. A little fellow of about a year and a half is to replace the big one. This is one of the serious mistakes that so many dairymen and not a few breeders make. When a sire has thus proved himself, he is of great value and should not be sacrificed simply because he is ill-tempered. All big bulls are dangerous and the sooner everyone learns this, the better. The gentle bull is the one that is more dangerous and often gets his victim. I have seen quite a few males sacrificed simply because they were ill-tempered that could not have been bought from a wise breeder for big money. It is a mistake to breed from an immature sire. In natural conditions with the wild animals, the strongest mature male is the progenitor of his race. This is one of the laws of natural selection that helps to perpetuate the best in the species. In nature the fittest survives and under artificial conditions we should not allow the infittest to survive. Do not forget the sire is half the herd and you cannot afford to use an untested one when you have one that has proved himself strongly prepotent along desirable lines.—National Stackman and Farmer.

THE HORSE.

Bitting Horses.

The rule in biting horses snould always be to bit them with ab easy or mild bit, writes a correspondent of an English publication. Horses that have been properly broken in and mouthed do not require severe bitting, and go best in a mild bit, whilst for breaking in a young horse an easy bit is essential, a severe one being quite out of place, as the latter will inevitably spoil the animal's mouth.

A mild bit—either curb or snaffle—requires to have a fairly thick mouthpiece. A bit with a thin mouthpiece is more or less severe, because the latter has a cutting action, which tends to hurt the horse. The thinner the mouthpiece of a bit is, the more severe is the latter in its effect upon the horse's mouth. A twisted form of the mouthpiece or any grooving on it adds to the severity of a bit, as the ridges on a twisted mouthpiece and the edges of the grooves on a grooved one tend to hurt the mouth of the horse by cutting into the flesh. A smooth mouthpiece is the easiest and most comfortable for a horse, and it is therefore the best and most suitable.

In curb bits the port must not be unduly high, as a high port means a severe bit. The port requires to be quite low in a mild or easy curb bit. Bits with high ports are neither sensible nor useful under any circumstances and should not be used. A mouthpiece with a very low port is the best, and it is practically as mild and as easy as a straight mouthpiece (having no port), which last is commonly seen in the Liverpool driving bit.

In the case of snaffles, the form or shape of the mouthpiece is the sole factor which determines the mildness or severity of the bit. But in the case of a curb bit its action on the horse's mouth is largely dependent upon the length of the lower cheek-ends. Tne longer these latter are in a curb bit the more severe is it in its effects, because the amount of leverage that is exerted by the bit increases proportionately with the increase in the length of the lower cheek-ends. It is, therefore, essential that a curb bit should have comparatively short lower cheek-ends if it is to be mild and easy. In the case of riding bits, the lower ends of the cheeks should not be more than twice as long as the upper ends (including the top eyes, and they may well be somewhat shorter. When the lower cheek-ends are longer than this the bit is needlessly severe for ordinary use.

The action of a curb bit is, of course, to some extent, affected by the way in which the curb chain is hooked in. A tight curb chain adds to the severity of a bit, whilst the more loosely the former is adjusted, the less severe is the action of the bit. A properly adjusted curb chain (being neither too tight nor unduly slack) should allow of two or three fingers being placed between it and the horse's jaw.

Care of the Aged Horse.

Some horses never seem to grow old, but are able to perform much work up to the age of twenty-five years, declared a writer in the "American Cultivator." With proper care and treatment the old horse is able to stand a great deal of work, and for light work is worth just as much as a younger animal. If offered for sale of course the old norse will not bring a very large price.

But if horses are to be serviceable until a good old age they must receive the very best of care and treatment at all times. They must not be neglected at any time, whether working or idle.

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.
March 28th, 1911.

Hillsboro, N. S.

MESSRS FRASER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

FOR SALE BY ALL DEALERS

Manufacturers: FRASER THORNTON & CO., Cookshire, Que.

The old horse does not always get proper attention in regard to feed. He cannot masticate some kinds of food, especially corn, thoroughly, nor can he eat his ration in as short a time as can a young animal whose teeth are sound. So, unless some ground grain is provided for him and he is given sufficient time to eat his meals when being worked, he will fail to get the full benefit of his food and in a short time will begin to lose flesh and strength.

When the horse begins to grow old give him just as good care as you did when he was young, and he will more than pay for his feed and care by the work which he can perform.

Watering Horses After Feeding.

It is generally understood that a horse should not be permitted to drink an excessively large quantity of water immediately after being fed, and more especially after a feed of grain. Most people believe this to be true, but few stop to ask themselves why it is the case. The horse's stomach is, comparatively speaking, quite small, and the result of its being filled with water when it is already holding the food material, much of which is only very imperfectly masticated, is to flush some of the grain out into the duodenum or small intestine, without its having first been acted upon by the digestive juices of the stomach, or being even reduced by the action of the stomach, so that the intestinal juices can exert their digestive action to the fullest extent. The opening from the horse's stomach is directly into the small intestine, and thus the food has not so many and so good chances of being digested as is the case with ruminants. It is necessary that the food remain some time in the horse's stomach before being passed on to the intestine, if anything like all the nutriment is to be obtained from it. The physical action of the stomach, together with the digestive fermentations which take place therein, requires time to be properly accomplished, and, as the stomach is the seat of the digestion, the intestinal juices being chiefly concerned in acting upon any partiglly-digested material, or any material that may have escaped the juices of the anterior and middle portions of the alimentary tract, it is important that it gets sufficient time to do its work properly. The intestinal juices are next to powerless when it comes to acting on whole or poorly-masticated grain which has been hurried through the stomach by the flow of water to the intestines. Water is not held in the stomach long. After feeding, the horse's stomach is usually full of food, which crowds the water out into the intestines, and with it undigested grain is often carried. Even if the grain is poorly masticated, if the stomach has time it will partly digest it and prepare it for the action of the ferments and enzymes in the intestines; but where the stomach is not permitted to do its work, much of the food material is lost. A little water some time after feeding is not very harmful, but large quantities very shortly after a grain feed are believed to be harmful and wasteful. It is better to water before feeding.

Breeding Mares.

A writer in the Live-stock Journal states that age has more to do with the production of foals than most breeders are willing to admit. Two-year-old fillies, if well matured and sufficiently developed, breed as readily as mares of any age. Doubtless some have wondered why it is difficult to get three or four-year-old mares with foal, and why it is that the number of foals produced by mares of this age is so small. The as the teeth, which are troublesome at this age, and which, it is said, cause of their not breeding is given cause an inflamed condition of the mucous membranes. Mares between the ages of seven and eleven years produce the largest number of foals, and comparatively few foals are produced by mares over fourteen years of age, and these few by those which have been kept breeding continuously. It is important that an old mare be kept breeding, for if she is, she will likely remain a breeder for many years. Allowing them to remain open for a year is risky, and it will often be found a difficult matter to breed them again. Horse-breeders cannot afford to let the mares miss a year, because very often, especially if they are aged mares, they may never breed again.

Vicious Stallions.

The best-tempered and kindest of stallions are thase that are given the privilege of companionship. It is the stallion that is shut up in solitary confinement, seeing his kind at infrequent intervals and receiving little attention from his owner or caretaker, that develops a bad temper which sometimes reaches the actually vicious stage. The door of a stallion's box stall should be so arranged that he can see all that is going on around him and feel that he is not shut up and forgotten. Under such conditions a stallion will seldom become an ill-tempered, vicious brute.—Breeder and Sportsman.

POULTRY.

Turkey Raising Profitable.

Of all domestic fowls, turkeys are doubtless the most difficult to raise on the farm and the hardest to control by the housewife, who usually has charge of this branch of industry.

In the first place, one should have good, matured birds to begin the business with, and they should be of some good breed and be good types of that breed. The gobbler should be at least two years old and the hens anywhere from two to six years old, as we find that stronger and constitutionally better birds are raised from birds of mature age than from young ones. The next thing is to see to the mating of these at the proper time. This is easily done by having about three or four hens to one tom. In the mating season one hen should be placed in the pen with a tom at a time. She may remain there a half day, or a day, as one thinks best, then be followed by another the next day, and so on. The food of all these turkeys should be wholesome and nourishing all the time, with plenty of water in clean basins, and all filth cleaned up daily.

The next thing after mating properly is to look after the eggs. And as the turkey seeks a nesting place in seclusion and on the ground she should have a place of this kind prepared in her pen, with plenty of fine hay for her nest and shelter from the cold rains that often fall at this season of the year. The eggs must be looked after daily, or hourly, in cold weather, and picked up as soon as the hen has left the nest. I am persuaded that eggs getting chilled is the cause of so many not hatching. As soon as picked up the eggs should be marked with the date, wrapped in tissue paper and then in flannel rags and placed somewhere that is not too cold nor too hot. The earlier we put the eggs to setting the better.

They may be set under the turkey hen, but this is not advisable, as she would better be kept laying until the end of the season. They may be set under the common hen, which often makes the better mother for them. This, however, hatches them in a small way, as a common hen can cover only a few eggs; but if they are to be used we should set several of them at once and when hatched give all the young to the same hen. If we resort to the incubator it is best to set some hens at the same time. and then give all the poults to a hen as soon as hatched. A hen of some kind is almost indispensable to their welfare. As soon as they are hatched they should be removed from the nest and looked over carefully for mites or lice; and if those are found the hen may be greased lightly with a little mixture of lard, sulphur and a small quantity of carbolic acid, very weak. The young ones will get enough of this from her to keep them from lice. Water of the purest and cleanest should be placed before them for they will learn quite early to drink when they have a hen to lead them to the water. After some hours food may be placed before them.

I find that at first boiled eggs mixed with boiled Irish potatoes is perhaps the best food that I have tried, as in the incipient state his food has been egg alone, and this mixture lets him down off the egg food lightly. The food in a short time should consist of corn bread well cooked and never in the raw or dough state. But just as soon as they are able to run about well they must have a lot in which is short and tender grass on which to feed. Here again comes trouble. If they are allowed to run on this when the grass is wet they are almost sure to die of exposure. So care must be taken to keep them on this grass all the time when it is dry and to keep them off it when it is wet. We see that in this alone is a lot of trouble and worry.

And here comes the food question again. As they grow larger they eat almost everything within reach that is edible. The cornbread food may be kept up, and may often be soaked in fresh sweet milk. Cracked wheat, corn grits and ground oats may also be supplied; for they at this time are perfect gormandizers. The lot may be enlarged and if it takes in some woods all the better, for here they get many things that they feed on in the wild state. The trees also protect them from the heat of the sun and hide them from hawks. A large bank of sand should be placed in the lot for them to wallow in and sulphur may be sprinkled in this from time to time with good results.

In this way a large per cent. of them may be raised, but this is not an ironclad method of raising them. The one who follows the business will find it a source of trouble, with some expense, but while turkeys are at the present prices the expense is comparatively small if we can raise the birds to maturity without too great a loss by death.—John Keith. in Tribune-Farmer.

Charcoal.

Charcoal is used for poultry for its purifying properties. It is supposed to act as an absorbent and destroyer of gases produced in the digestive tract when the system is out of order, and also of impurities in the blood. It is used in both the granulated and pulverized forms. The granulated is usually fed in hoppers, the other mixed with mashes. I consider the granulated preferable, because when fed thus the fowls take only what they wish, fed in mashes they are apt after a little while to reject the mash containing charcoal.

Sprouted Oats.

One of the cheapest foods for poultry is the sprouted oat. You will get about three times the feeding value from a sprouted oat as from an ordinary dry oat.

The starch in the oat is converted into dextrine and sugar. You have heard of the patent breakfast cereals; well, here you have the idea for your poultry.

Ten pounds of oats will make about 35 to 40 lbs. when sprouted. Simply put some oats into shallow boxes, about one and a half ioches deep, keep moist (not water-logged), and in a week or two, according to the weather they will sprout up and be fit for use. Now I am talking t men who know more about growing oats than myself. Can any reader suggest a good idea to sprout the oats in the winter? Let us have a letter or two on the subject. Maritime Farmer columns are open to readers, and interesting letters are always welcome on any subject of interest. May be you have found out something that other people have not noticed; let us have the news for the benefit of the poultry industry.

Keep the Poultry House Free From Vermin.

You cannot profitably raise chickens and lice in the same house. If the fowls have body lice, dust them with some good insecticide, renovate and fumigate the house thoroughly, paint the roosts, nest boxes and furnishings with a good lice paint, sprinkle a generous amount of air-slaked lime on the dropping boards, provide new litter and nesting material, and your efforts will be rewarded in increased egg production and general thrift of your fowls.

Comb Diseases.

Most comb diseases can be quickly cured by the application of boracic ointment. If this fails mercurial ointment must be used.

Scaly Legs.

This is a parasitic disease. It consists in eruptions formed beneath the scales caused by the parasites burrowing there. It is a contagious disease, annoying but not particularly dangerous. It must be remedied at once or you will have trouble.

Wash the legs of all birds suffering from scaly leg with hot water and soft soap, dry, then paint legs up to hocks with coal oil, or hold legs in a tin of oil for two minutes; be very careful not to go above hocks, if you let any oil get on skin under feathers it will blister the bird. Now wipe legs (not quite dry(and apply sulphur ointment every night for a week to legs. Then again wash with soap and water. All the powder excrescence should now come off if you use a stiff brush. Be sure to disinfect perches to stamp out the disease.

Liver Troubles.

When a hen goes purple or black in comb, mopy, and lame in one leg, immediately give a good dose, half a teaspoonful of Epsom salts in warm water, or plenty af charcoal. These are symptoms of liver disorder.

"It is a pleasure to tell you that Chamberlain's Cough Remedy is the best cough medicine I have ever used." writes Mrs. Hugh Campbell, of Lavonia, Ga. "I have used it with all my children and the results have been highly satisfactary." For sale by All Dealers.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Old Doctor Cheerfulness.

Twenty drops of sunshine, mix 'em all together
Take 'em with a mile or more of bright, fresh weather;
Twenty drops of smiling heart, laughter ringing out—
Soon we'll have you well enough to up and be about!

Half a mile of exercise on the bloomy highway,
With a little sparkling eye lifted to the skyway;
Forty grains of atmosphere, with a bird song in it—
Why, you're convalescing, lad; better every minute!

Dozen kindly deeds a day, helping some one's trouble,
Break and blow a mile away like an airy bubble;
Good, you're getting on so fine soon be time to leave you!
To the lips o' love-of-life waiting to receive you!

Morning-glory plaster, plain, on your rheumatism;
Little glimpse of morning gold through love's azure prism—
Why, you'r growing young again!
Say, you're well all over,
All you need's a buttercup and a field of clover!—Folger McKinsey.

Love's Barrie

(Continued from last issue).

CHAPTER XII.

NOBLESSE OBLIGE.

"Please, ma'am, that's Mrs. Hayes coom to caa."

Helen, dozing in the depths of the big easy chair by the study fire, sprang up somewhat confusedly. She had been dreaming of impossible things, and a strange nightmare followed her awakening.

She had long, busy mornings in Midcar Rectory, trying to create beauty where none existed. The staring wall papers, the crude garish colours, the lack of harmony in the house, made her tired. The study, with its plain-coloured drugget, its green distempered walls, and its friendly bookshelves, was the only place where her eye could rest. But she had started bravely; she would make a home. The poor little makeshifts which Jane had contrived to hide the poverty, filled her with compassion. They were so pathetic and so wholly inadequate. The drawing-room she had not yet found courage for. She was waiting the quarterly payment of her allowance to spend it there. It had a cheap carpet of coarse tapestry, patterned with coloured roses on a green ground; a round table stood in the middle of the pattern, covered with a green cloth, and having books and albums laid round it at stated intervals; while a case of stuffed birds, relic of the Somerset house, adorned the centre. On the white marble mantelpiece a small gilt clock was flanked by two ornaments of jingling glass, with crimson base. Some family photographs, enlarged from the original negatives, and having a strange blurred effect, were on the walls. They represented mostly uncomfortable-looking persons of uncertain age, wearing unnatural expressions, and obviously conscious of unusual clothes. A fat gentleman wearing a smirk fingered an immense gold fob which dangled below an embroidered waistcoat. The furniture was light-coloured walnut, upholstered in green rep, and there was not a single safe or inviting-looking chair.

It was all so hideously, gratuitously ugly, that Helen had already decided that nothing but a bonfire and a clear field would help her out. She rubbed her eyes and fixed Hannah's stolid lace with rather a searching glance.

"Where have you put her, Hannah?"

"In the drawin'-room of course, ma'am. Miss Jane told me that wur th' place for ivvery wan what coom to caa."

"Go and bring her down here."

"Yus, ma'am."

Hannah departed willingly enough. She liked the new mistress, albeit her ways were not the ways of her dear Miss Jane. As she had confided already to Ann Coyne, "It wur loike goin' oot into service a'a ovver agen."

Helen straightened her shoulders, pulled down her neat flannel blouse, and stole a glance into the pretty old-fashioned Chippendale glass, which the Rector had picked up in a moorland cottage and hung against his study wall. Her white linen collar was immaculate, her black tie neat and becoming. She wore no ornament but the shining circlet of her wedding-ring.

She took a step forward as Hannah's heavy foot came stumping down the stair.

"I am very sorry that you should have been shown into a room without a fire," she said politely, as the rich and ample vision of Mrs. Hayes filled the doorway. The odour of fine perfume and sable furs swept into the room, and seemed to fill it. Mrs. Hayes, secretly resenting the fact that Mrs. Secretan had not herself fetched her from the green drawing-room, was prepared to be hostile, or at least a little distant. But Helen seemed perfectly unconscious. Her clothes were plain, but she wore them with an indescribable air. The poise of her small head was proud and high; there was breeding in the turn of her neck, in the perfect ease of her manner. Mrs. Hayes realised that here her patronage might fail.

"It is very kind of you to call," said Helen courteously as she sat a chair. "Won't you come nearer the fire? I think the day is very cold, but I have been so very busy all the morning, I only seemed to feel it when I sat down by the fire. I rather think I had fallen asleep."

"I am sorry if I have disturbed you," said Mrs. Hayes graciously, as she spread herself on the offered chair. At the same moment she threw back her rich sables and revealed the lace-trimmed front of her elaborate gown, and the large diamond crescent sparkling on her breast. Her bonnet was adorned by an enormous upstanding osprey, which gave her an aggressive look. She had a comely enough face, but it had grown a little hard and coarse. Her steely grey eyes breathed criticism rather that kindliness. Helen had not liked her looks when she had beheld her at a distance on Sunday morning, and she did not feel more drawn to her now.

"My daughter would have come with me, only she had a feverish cold, and I made her keep her room. She is such a foolish child; she is always about in the cottages nursing sick babies and waiting on ailing mothers. I live in mortal dread of her catching something; she's just like her father, she loves poor people and is never happier than when messing about their homes, though I keep telling her they are the most ungrateful set on earth."

"If they are like our Midcar poor people, I find them very interesting, and they have been so kind to me, you can't think. Did you ever know such a dear as that old Ann Coyne at the shop?"

"There, now," said Mrs. Hayes perplexedly. "That's just how Audrey talks! I believe she would invite Ann Coyne to tea at High Ridges, if I would let her. I think she is a meddlesome, impudent woman who doesn't know her place."

Helen sat back, smiling softly. She thought she would rather enjoy the visit of Mrs. Hayes, after all.

"How is the Rector? I haven't seen him since you came back, and we are hoping you will come up to dinner in a friendly way one of these evenings. Only just ourselves, of course, at first. That's Mr. Hayes's idea. He says he wants to get to know you, and that there isn't any chance in a crowd."

"I quite agree with Mr. Hayes," said Helen politely, but not warmly.

"But after we might make a little dinner for you," said Mrs. Hayes patronisingly, "and ask the sort of people—the sort of people you should know. Of course, coming to a new place, one has to be very careful. We found that out when Mr. Hayes bought High Ridges first. All sorts came, and it was very difficult afterwards weeding them out. I should like to be useful to you in that way, Mrs. Secretan. I have great experience, and, of course, in my position I know everybody."

"How dreadful for you!" murmured Helen, smiling still. "I should not like to know everybody. I shall have to receive everybody at the Rectory, of course, as my husband would wish me to do. But one always chooses one's friends sooner or later, don't you think? It is not a matter for arrangements."

"Well, of course, like draws to like," said Mrs. Hayes, not knowing what to make of this speech. "But you are young and can't be too careful. So much depends on first impressions, and on the stand one takes up. Of course"—and here she hesitated just a moment—"there has been a good deal of talk about your marriage. It was all so sudden and unexpected, and on that account greater tact has to be exercised. I am very willing to be your friend from the beginning, and to pilot you, if you like, socially. I was rather glad to come here alone this afternoon to say this."

Helen did not immediately reply.

"We are all very fond of Mr. Secretan, of course, and really he is a perfect gentleman, fit for any society. His sister, poor thing, has been rather a drag on him. She is an excellent creature, but just a trifle impossible. We were all so very glad when we heard Mr. Secretan was marrying so—so irreproachably."

"Were you? Do you know, Mrs. Hayes, that I have never met a more perfect gentlewoman than Miss Secretan, and if I thought I should ever grow to be as good as she is, I think I should feel very happy."

"Of course she is a good creature, excellent, I think, was the word I used," said Mrs. Hayes, warming to theme, and sitting forward eagerly. "But a perfect gentlewoman. Oh, come, now, Mrs. Secretan, you are joking, surely. She does not know how to dress, or to behave in really good society. She has dined at High Ridges once or twice, and really it was most awkward for everybody, and I felt very sorry for the Rector. A good creature, yes, of course; and she will make an excellent housekeeper to Mr. Courtney, though, after all the scandal there was about his wife, I can't think how she could ever go there."

Six

minutes is all the time required for brewing Red Rose Tea; and the result is a beverage of matchless flavor and satisfying strength. The verdict of your family will be that

RED ROSE TEA "is good tea"

DOCTOR ADVISED OPERATION

Cured by Lydia E. Pinkham's Vegetable Compound

Canifton, Ont.—"I had been a great sufferer for five years. One doctor told me it was ulcers of the uterus, and another told me it was a fibroid tumor. No one knows what I suffered. I would always be worse at certain periods, and never was regular, and the bearing-down pains were terrible. I was very ill in bed, and the doctor told me I would have to have an operation, and that I might die during the operation. I wrote to my sister about it and she advised me to take Lydia E. Pinkham's Vegetable Compound. Through personal experience I have found it the best medicine in the world for female troubles, for it has cured me, and I did not have to have the operation after all. The Compound also helped me while passing through Change of Life."—Mrs. LETITIA BLAIR, Canifton, Ontario.

Lydia E. Pinkham's Vegetable Compound, made from roots and herbs, has proved to be the most successful remedy for curing the worst forms of female ills, including displacements, inflammation, fibroid tumors, irregularities, periodic pains, backache, bearing-down feeling, flatulency, indigestion, and nervous prostration. It costs but a trifle to try it, and the result has been worth millions to suffering women.

"Best for Baby—best for you."

Baby's Own Soap

Made of specially purified and refined vegetables oils. It will not hurt the most delicate skin.

Refuse all substitutes.

"Miss Secretan would go wherever there was need of her, and no matter how hard it was or how much self-sacrifice was involved she would never hesitate. I don't think that you and I, Mrs. Hayes, are fit to discuss Jane Secretan."

The colour flamed hotly in Helen's cheek.

"Dear me, surely you are very fond of her, though people thought when she left so suddenly it was on your account. Well, don't let's talk any more about Miss Secretan, she is really only a side issue now. We are all very glad that the Rector has married you, and now the Rectory will be a real centre of social intercourse. Can you fix a day now for you and Mr. Secretan to come out to dinner, and we shall send the carriage for you? It will not be any trouble, for you see we have two pairs of horses, and even if one has to go down to Bradfield for Mr. Hayes, the other is available."

"I shall have to consult Mr. Secretan," murmured Helen, a trifle confusedly.

"Oh, but Mr. Secretan will be delighted to come. He always is. Of course, Mr. Hayes has done a great deal for the church. Did you know that he put the whole of the heating apparatus in at his own expense, and had the organ overhauled? I assure you you will find us very good friends, and if I can be of any use to you I hope you won't scruple to make use of me."

"Thank you very much," murmured Helen, again wondering how long this sort of thing would go on, and whether she would be safe to ring for tea.

"I'm afraid I'm not a very sociable person, Mrs. Hayes. You won't find me the least interesting in that way."

"Oh, but you must come out of yourself," said Mrs. Hayes affably. "You owe it to yourself, and of course, in a garrison town you must have had a good deal of society of a kind. So you mustn't pretend shyness. I assure you, you will find the West Riding folk very warm-hearted, though some of them ride a bit on their high horse. These, of course, we can let alone. I suppose you have heard that the Duchess-Dowager of Eastlake has come to Mardocks. Of course, she will probably not know anybody, unless Lady Durham; but we can live without these high and mighty folks, and have a very good time. The best way is not to let them know one cares a fig about them."

Helen nearly laughed outright.

"The Rector hardly thinks it can be true about the Duchess of Eastlake."

"Oh, but it is; she arrived at Mardocks the day before yesterday. My maid Grigson has a young sister gone to be still-room maid there, and I do assure you the Duchess has arrived. I shall call, of course, after a time, when I get an idea how the land lies. That is the secret of social success, Mrs. Secretan, not to rush anything, but to walk very warily. Personally, I don't care a fig for social ambition, but, of course, I have a young daughter whose future causes me a good deal of anxiety."

"I am sure it need not," said Helen hastily and quite sincerely. "She is the most beautiful creature I have ever seen. Her future is assured. If it is matrimony you want for her, she will be able to pick and choose in a whole county, I am sure."

Mrs. Hayes simpered a little.

"So you think Audrey pretty; you will please her father if you talk to him like that. Would you believe I looked exactly like her at her age? When you come to High Ridges I will show you an old-fashioned miniature which will convince you. But though Audrey is pretty, she has no sense. She would make the most undesirable acquaintances if she were left unwatched. She is so impulsive!"

Before Helen could reply there came the sound of new wheels on the gravel path beyond the windows, and presently a double knock sounded through the house. Hannah's heavy foot was heard proceeding towards the front door, and the next moment the study door was opened, and a small, slim figure, in widow's weeds, with a clear cut cameo-like face ravaged by suffering, appeared in the doorway. Hannah departed without uttering any name or making the smallest announcement. Helen sprang up, and all the colour receded from her face.

The visitor rapidly crossed the room, holding out both her hands, and smiling very sweetly, though a trifle archly.

You will be proud of the bread you'll make with PURITY FLOUR

AFTER seeing a batch of big, golden-crusted, snowy-white loaves, that you have baked from PURITY FLOUR, you will, indeed, be proud of your cooking-ability—and proud of your wisdom in deciding to pay the little extra it costs to procure such high-class flour. You will admit, too, that we are justified in the pride we take in milling this superb flour.

PURITY FLOUR

"More bread and better bread"

PURITY FLOUR is milled exclusively from the best Western hard wheat—the world's finest. More than that, PURITY FLOUR consists *entirely of the high-grade portions of the wheat.* The low-grade portions are separated and excluded during the PURITY process of milling. Such high-class flour, of course, expands more in the baking. It makes *"more bread and better bread."*

It makes lighter, flakier pastry, too, if you just take the precaution to add *more* shortening. On account of its unusual strength PURITY FLOUR, for best results, requires more shortening than ordinary flour.

Progressive dealers, everywhere, sell PURITY FLOUR and take pride in recommending it.

Add PURITY FLOUR to your grocery list right now. 106

An excellent "Buy"

the preferred stock of a big, prosperous, expanding business concern—a concern controlling Natural Rosources which are bound to double the value of its securities before long.

This preferred stock is cumulative, profit-sharing—the 7 per cent. dividend payable twice annually.

You can resell this stock to us or the company, at par, plus 7 per cent, one year from the date of your investment.

Because the block we now control is limited you'd best write to-day for particulars.

"So it is true, dear child, and I actually find you here! Heavens, what a stroke of luck! For I'm at Mardocks. Do you hear, Helen, at Mardocks, only a mile distant! When they told me the Rector had married a Miss Revell I could not credit that it could be Bob Revell's daughter, and I'm come to see for myself."

She put her hands on Helen's shoulders and kissed her on both cheeks.

Helen's eyes were smiling, and if a little mischievous light crepy up in the background, she could hardly be blamed.

"Duchess, will you permit me to introduce one of my husband's parishioners, who will also be your nearest neighbour, I believe—Mrs. Hayes, the Duchess of Eastlake."

Mrs. Hayes, visibly trembling, bowed exceedingly low.

"Delighted, I'm sure, to meet your Grace, and so unexpected, too! Who would have thought Mrs. Secretan would have such high-born friends? Yes, we are neighbours, and I hope now we have met, that your Grace will let me call on you very soon. We are all very friendly in the West Riding; our own parish, I do assure you, is quite like a little family."

"Thank you very much," said the Duchess in a small, quiet, rather cold voice. "I'm alraid I shall not have the courage to cultivate new friends. I am an old woman, not strong, very poor, and rather tired. I have come to Mardocks for rest. But I am uncommonly glad to find this child here! I knew her father when he was a boy, and just missed being her mother."

Mrs. Hayes pondered over this cryptic speech all the way home, but it was Audrey who had to enlighten her by explaining that, of course, the Duchess meant that she and Colonel Revell must have been lovers once.

Mrs. Hayes presented rather a pitiable spectacle. Her manner was abject, and she struggled vainly to hide her swelling pride at the stroke of good luck which had given her the opportunity of meeting the Duchess at such close quarters. She had the good sense, however, to see that it would be courteous in her to leave, since such old and intimate friends must naturally have much to say to one another. She departed, her silken skirts trailing majestically after her; while the small figure in shabby black with an amused expression on her face, sat upright on the old settee and began to take off her gloves.

When Helen came back into the room they both laughed.

"Who is the woman? She simply breathed money at every pore. An elevated cook, Helen, eh? Tell her next time you see her not to address me as if she were my servant; but I don't want to see her again. Well, now, come and sit down beside me and tell me the meaning of this matrimonial venture. Who is he, and where did you meet him?"

Helen sat down and momentatily dropped her eyes. She knew that tone of old; the calm scrutiny of tne keen old eyes which nothing escaped.

"He is the Rector of this parish," she murmured inconsequently.

"What Secretan is he? There were Sectetans in the Fen country. I remember Crespigny Secretan breaking his neck in the hunting field when I was a girl. They had a place about nine miles from Grantham. Is he of that ilk?"

"He is no particular Secretan, Duchess. His father kept a linen-draper's shop in Somerset."

"Then how did the linen-draper's son get you?"

"In the usual way. He proposed and I accepted. We met in Paris about three months ago."

"I see, case of love at sight on his part, that's easy enough to grasp for, upon my word, Helen, I never

PANDORA Range

What a "Pandora" Hot-Water Attachment Means to Me

"BELOW—You see how I just turn on the tap and instantly get hot water for my dishes, washing, scrubbing, preserving, etc.

"ABOVE—you see how the pipes are connected to the bath and basin—no waiting for a bath—no carrying hot water upstairs."

"Pandora" Ranges can be supplied with a hot-water attachment if you haven't already got one, and the attachment does not either take extra fuel or interfere with baking.

Do You Shave Yourself?

If so, you no doubt have shaving troubles, as there isn't one man in fifty who knows how to strop his razor correctly, the almost invariable result is a rounded edge instead of a keen, sharp edge so necessary to a clean satisfactory shave.

MAIL ORDERS FILLED

BRANDT'S AUTOMATIC RAZOR STROPPER

"Makes every man an Expert." Does what no human hand can do.

It automatically sharpens the ordinary old style razor any size or make, and all kinds of safety razor blades including the Gillette, Ever-Ready, Durham-Duplex, Keen-Kutter, Enders, etc. It sharpens them better than the most expert barber can do it. In using the Brandt Automatic Stropper, you do not hold the razor while stropping. You cannot round your edge or cut your strop. The Brandt Automatic Stropper strops the razor for you. It requires no skill or experience. We invite any man who shaves himself to call at our store, and examine this celebrated stropper, and see how it does away with all stropping troubles.

saw you look more charming. But why you took the plunge is not so easy to comprehend."

"It had become intolerable there at Colchester with Cynthia. It was a way out."

The eyes of the Duchess cleared, and a vast pity entered them.

"Child, if I had but known, you should have come to me in Califor. nia. Why did you not write to an old friend?"

"I had not the address, and California seemed outside the world. Besides, I had not the right to trouble you with my affairs."

"So it was Cynthia's doing. Heavens, what mountains of misery that insect has to answer for! She broke your father's heart, I know; but I thought you were made of sterner stuff. Somebody wrote to me from Southwold telling me they had heard you were to marry Angela Hunt's nephew. Was there nothing in that?"

"Nothing," replied Helen hastily and hardly, as she averted her eyes.

"Ah, well, I'm not sorry. The Hunts are bad—stock, lock and barrel of them. There isn't a heart in the connection. Where is this husband of yours? I'm curious to see him."

"You will see him if only you wait long enough—he will be in to tea presently."

"I hear him well spoken of, but I can't imagine you as chatelaine of this very obvious country parsonage. Do you remember my brother Anthony Helen? I don't think you ever met him."

"No, I never did; but I've heard my father talk of him, of course."

"He's a perfect dear. That was the husband foe you now, Helen, if only twenty years had been taken off his age. He is fifty-two, but he has the heart of a boy."

Helen faintly smiled, thinking of the world from which she had cut herself off. Somehow the Duchess did not like the expression in her eyes.

She laid a sudden hand on her arm, her shrewd old face alive with kindliest concern.

"Noblesse oblige, Helen! If there is a price to pay, your father's daughter will pay in full."

Helen swallowed a breath, uncommonly like a sob.

"That is Claude's key in the door, Duchess. Let me go and tell him you are here."

An hour later the Duchess left the house. These were her parting words:

"He is a man, Helen! He has looks, understanding, commonsense. With such a one the linendraper's shop ceases to exist. You have something to build upon. Noblesse oblige."

(Continued in next issue).

The Family Medicine Chest.

The medicine chest in the farm house should be well supplied with reliable staples in the way of medicine, the few simple remedies that are used about the house. Keep always on hand those remedies experience has shown you, you need, and whose prompt use may prevent a serious illness or whose lack will be seriously felt in time of emergency. One often knows just what should be done in case of emergency, but the actual emergency drives it out of one's head. For that reason it is wise to have an emergency card on the medicine chest door or somewhere near the drug supply. On this card have a list of accidents and what to do to bring relief. A broken bone, a cut, a scald, a sunstroke, are not unusual on the farm and they are accidents that need prompt attention. A quick glance over your list will show what to do and what medicine to use. Another useful adjunct to the medicine chest is a supply of clean strong cloths and pieces of wool. The need for these things may never arise, but if it does you will be very thankful that you were ready for the emergency. A good habit to acquire is to never use any medicine without reading the label on the bottle both before and after pouring it out and always pour away from the label to avoid defacing it. Medicines should be kept in some convenient safe place by themselves, not on the pantry shelves with the flavoring extracts.

Which is Your Choice?

Sloppy, leaky wooden troughs, or clean, durable Concrete?

Wooden drinking troughs are about as reliable as the weather.

They are short-lived and require replacing every few years—not to mention continual patching to keep them in repair.

The best of wood cannot withstand, for long, constant dampness and soaking. Its tendency to rapid decay soon shows itself in leaks and stagnant pools of water around trough.

Contrast with this the durability, cleanliness and well-ordered appearance of Concrete.

Which?

The dampness which destroys lumber only intensifies the strength and hardness of Concrete.

You can impair a wooden trough with comparatively little use; but it takes a powerful explosive to put a Concrete water tank out of business.

Which

is your choice—expense-producing Wood, or money-saving Concrete?

We'd be glad to send a copy of our book, "*What the Farmer Can Do With Concrete*,"—Free—if you'll ask for it. It tells the many uses of Concrete in plain, simple language—tells how to make

To Clean Glass Over Pictures.

To clean the glass over pictures dip a piece of chamois in alcohol, wring nearly dry, and wipe thoroughly, yet lightly. Polish with a piece of dry chamois. The gilded frames may be cleaned with the alcohol. If oil paintings need cleaning thoroughly dampen a soft cloth in warm water in which some castile soap has been dissolved. Dry carefully and then varnish lightly with some thin clear French "retouching" varnish. It is well to consult an artist with regard to the best varnish.

A good Christmas present for one of your farmer friends is a one year sudscription to the Maritime Farmer.

Keep Your Soil at Top Notch Producing Power

THE utmost care and attention given to plowing, harrowing, seeding, cultivating, and harvesting cannot make up for lack of fertilizer, which is necessary to keep the soil at the top-notch of its producing power. In fact, fertilizing is of first importance.

Of all fertilizers, manure is best, because it replaces just the elements the crops have extracted, and is most economical.

But to get its full value, manure must be spread evenly, in proper quantities. Only a good manure spreader will spread it this way. Get an I H C if you want to be sure of the greatest value for your money.

I H C Manure Spreaders
Corn King, Cloverleaf

are simple, strong, and perfect in design and construction. They are light in draft and durable. Here are some of the features and advantages that make I H C spreaders the best investment for you.

The method of transmitting power from the wheels to the beater is simple and direct. There are no unnecessary parts to wear. The beater is large in diameter, and the teeth are long, square, and chisel-pointed, so that the manure is thoroughly pulverized and thrown out before it wedges against the bars, thus reducing the draft.

The apron is supported by steel rollers, and the slats are placed close together, so that manure does not sift down and interfere with the movement of the rollers. The steel wheels have ample strength to carry many times the weight they will ever be called upon to bear. The rims are flanged inwardly to prevent cutting and rutting of meadows and accumulation of trash. There is no reach to prevent short turning.

I H C Manure Spreaders are made in several styles and sizes for field, orchard, and truck farm use. See the I H C local agent for catalogues and complete information, or, write nearest branch house.

Total profit on 6 cows, over-feed, at liberal prices—$290.82, or $48.47 per cow. These six cows consisted of: 1 five year old, 1 four year old, 1 three year old and 3 two year heifers.

The above records are officially attested to by J. G. Rutherford, Live Stock Commissioner, Ottawa, and his inspector, D. Drummond.

MARKETS.

Charlottetown Prices.

GRAIN—Oats, White, 44c., Black, 45c.

FEEDSTUFFS—Bran, Retail, $1.35 to $1.45; Shorts, $1.45 to $1.50; Middlings, $1.50; Oil-cake, $2.50 to $2.60; Corn Meal, $1.80 to $1.95.

LIVE STOCK—Butcher's Cattle, 3c. to 5c.; Stockers, $18.00 to $30.00 each; Milch Cows, $25.00 to $40.00 each; Sheep, 3c. lb.; Lambs, 3c. to 3½c..

DRESSED MEATS—Beef (carcass), 7c. to 9c. lb.; Beef (retail), 8c. to 16c. Mutton (retail), 8c. to 14c.; Lamb (retail), 8c. to 16c.; Pork (carcass selected), 7¾c.; Pork (carcass light), 6c. to 7c.; Pork (carcass heavy), 6c. to 7c.

HORSES—Drafters, $150 to $225.

DAIRY PRODUCTS—Creamery Butter, solids, 27c.; Creamery Butter, Prints, 28c; Dairy Butter, 19c. to 22c.; Cheese, 14¾c.

POULTRY AND POULTRY PRODUCTS—Eggs, 23c. to 24c.; Fowl,8c.; Chickens, 8c. to 12c.; Ducks, 12c.; Geese, 10c. to 12c.; Turkeys, 16c. to 20c.

FRUIT—Apples, $1.50 to $3.50 per bbl.

MISCELLANEOUS—Hay, Pressed, $11.00 to $12.00, Loose, 65c.; Straw, $5.50 to $6.50; Wool, 23c. to 25c.; Beef Hides, 10c.; Calf Skins, 12c. to 15c.; Sheep Skins, 50c. to 60c.; Lamb Skins 45c. to 60c.

VEGETABLES—Carrots, 40c. bus.; Potatoes, 30c. to 86c.; Turnips, 12c. to 13c.; Beets, 40c. bushel; Cabbage, 50c. to 60c. per 100; Parsnips, $1.00 per cwt.; Oysters, $4.50 to $5.50 per bbl.

Markets have been quiet since our last report and there is little change to note, except in oats which are high, and an advance in pork which was not unexpected, although at the moment the market for dressed hogs is easy and we do not look for any further advance unless there is an advance in the West. Oats continue scarce and in good demand for Newfoundland account. The trade in potatoes is pretty well over, except in schooners, but shippers do not care to take the risk of rail shipments after this. Butter is rather unsettled. There seems to be plenty to supply the demand but increased orders might mean an advanced price for dairy butter besides the summer's accumulation of stock in cold storage and elsewhere is being worked off and fresh receipts will command better prices. Poultry is offering freely and prices are quiet. Hay is rather scarce in most sections and farmers are holding for advanced prices which they expect will come later.

St. John Prices.

GRAIN—Oats, 54c. to 58c.; Buckwheat, $2.25 to $2.50.

LIVE STOCK—Milch Cows, $40.00 to $45.00.

DRESSED MEATS—Beef *carcass), 6½c. to 9c.; Beef (retail), 10c. to 18c.; Mutton, 7c.; Veal, 9c. to 10c.; Pork, 7½c. to 8c.

DAIRY PRODUCTS—Creamery Butter,25c. to 28c.; Dairy Butter, 24c. to 26c.; Cheese, 14c.

POULTRY AND POULTRY PRODUCTS—Eggs, fresh, 45c. to 50c.; Fowl, 70c. to $1.10; Cnickens, 70c. to $1.10; Ducks, $1.25 to $1.40; Geese, $1.15 to $1.25; Turkeys, 23c. to 25c.

FRUIT—Apples, $1.25 to $2.00.

MISCELLANEOUS—Hay, $10.00 to $12.00 per ton; Wool, 15c. to 21c.; Beef Hides, 11c.; Calf Skins, 16c.; Sheep Skins, 50c. to 60c.; Lamb Skins 50c. to 60c.

VEGETABLES—Carrots, $1.25 to $1.30 per bbl.; Potatoes, 1.80 to $2.00 per bbl.; Turnips, 90c. to $1.00; Beets, $1.25 to $1.30.

The market conditions during the last two weeks,as a whole, have been good. There is a good demand for first-class Mutton also for turkeys and good poultry of all kinds. There is a good demand for domestic Beef. Pork is bringing a better price this week. The coming week will bring better prices. There is a call for potatoes and vegetables. Good Butter will sell at any time.

Don't waste your money buying strengthening plasters. Chamberlain's Liniment is cheaper and better. Dampen a piece of flannel with it and place it over the affected parts and it will relieve the pain and soreness. For sale by All Dealers.

FLORICULTURE.

A., St. John, writes:—I am going to grow some house plants and I wish you would give me all the instruction you can in regard to caring for them. My first question is: How should they be watered?

Ans.—It is difficult to give rules for watering plants as no two plants in a collection may require the same treatment. A good general rule is to water whenever the top soil commences to dry. Do not wait until the soil is dried out. Water thoroughly always watering them over the top of the pot—never by putting water in the saucer. Empty out all water, from the saucer, that drains through the pot. Root bound plants require mote watering than newly potted plants and care should be taken that plants in this condition are thoroughly soaked to the bottom of the pot each time of watering.

Do not have a stated time for watering plants, whether they need it or not, but look over your plants two or three times a day and give water only to those requiring more moisture.

The Aspidiatra or Parlor Palm, so called, likes heat, moisture and partial shade but will stand a low temperature though not frost. It needs repotting as often as the pot becomes crowded with roots.

The Amaearia Exceliasor or Nawfork Island Pine, likes a moderate temperature, partial sunshine, plenty of air, only a moderate amount of moisture and no period of rest. It must not be repotted unless the pot is full of roots.

Begonias, the flowering varieties, like a temperature of say sixty degrees at night and plenty of sun and moisture. The Rex type requires the same temperature at night, no direct sunshine but still strong light. Don't spray the leaves and handle with care. Keep the soil just right and moist using light soil and see that the drainage is perfect. The tuberous rooted varieties like plenty of sunshine and will grow in partial shade out of doors. They do best during the spring and summer months and should be dried off during the winter months.

The Umbrella Palm is an acquatic plant that requires a lot of water. You may even keep the saucer full. It is easily grown in either sunshine or shade and likes a moderately warm room.

The Parlor Asparagus likes plenty of water on its foliage and only a moderate amount of soil moisture. Give it partial shade in a warm room. It requires repotting frequently and if root bound it is apt to loose its foliage.

The Rubber plant is another fine plant for house growing. One writer asks if the leaves turn brown and fall off, will new leaves form in their place? What can I do for them?

Ans.—This plant is, apparently, badly infested with red spider and they have caused the loss of leaf. The foliage should be frequently washed or sprayed after the winter fires are started. If this had been attended to earlier the plant would not have suffered as it has. The leaves will not grow out as before, but branches will appear at some of the axes of the old leaves. Much care should be taken that the soil does not become water-soaked as the few remaining leaves do not require nearly so much water as they did before. At this season, the foliage of Palms and Rubber Plants should have moisture applied at least twice a week, to the under side of the leaves.

The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

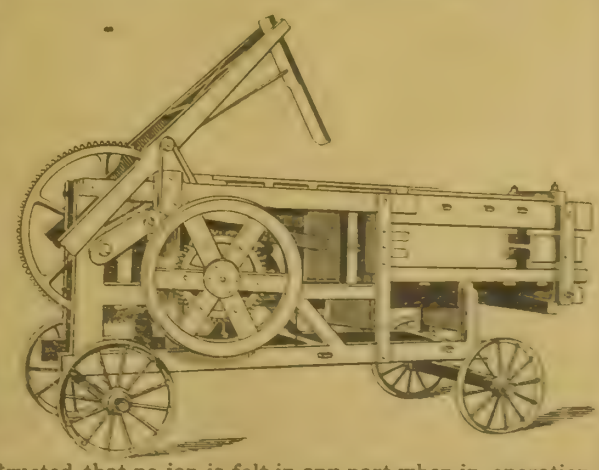
Improved Trenholm Gear Hay press

Operated With Gasoline Engine or Tread Power.

The More Power The More Work.



Note the strong, heavy frame built of the best quality of well seasoned hardwood. The heavy balance wheel weighing over 500lbs. The heavy cog wheel weighing over 500 lbs. Thesidesprings made of the best quality of spring steel. The bale box is steel lined and the whole machine so powerfully constructed that no jar is felt in any part when in operation.

This is now the season for Wood Cutters, we manufacture them in three different sizes; Long Swing, Short Swing and Flat Roller Table.

In Farmer's Feed Boilers we make the Star with steel frame and cast culdron in three sizes and the All Cast in two sizes.

We can fill your orders at quick notice. Get our catalogue and prices at once.

THE SUSSEX MANUFACTURING CO. LTD., SUSSEX, N. B.

How One Farm-Owner Found a Road to Prosperity.

A few summers ago—to be exact, it was in 1909—I stopped off with a companion to visit a boyhood friend who owned a considerable farm on the outskirts of a little farming village.

"I never seem to get anywhere," complained our host to us, as we sat on his porch that afternoon. Every time that I get a little ahead of the game and have a little money in the bank ready for the girl's education, some unexpected expense comes up—the money all goes for repairing a barn or buying waggons, and there's nothing to show for the year's work. This year it's the same old story—it will take every spare penny to pay for the new harvester. I'll never get anywhere."

This man was a good farmer and a hard worker, but like many others he had never learned that the modern farm to be profitable must be conducted along modern business lines. He made no allowance for the cost of keeping up his farm and he was regularly disappointed when the year's work showed little or no profit. He did not spend a dollar on maintenance, and consequently he was continually digging down into his jeans for money to pay for new buildings, implements, etc.

We three walked around the farm. The barn, built less than ten years before but absolutely free from paint, showed distinctly where sun, wind, rain and frost had done their destructive work. Under open sheds and in the corners of fields were various pieces of farm machinery where they had stood since the previous harvest. Rust had eaten its way into the expensive metal and in several places I could stick the blade of my pocket knife deep into open seams in the wood.

We stopped in front of the wreck of the old harvester. "There," said our host, disgustedly, "I bought that in 1903 and look at it now; I'll never buy that make again."

"When did you paint it last, Dick," I inquired.

"Paint it?" said he, paint it? Why it was painted when I bought it."

"And you haven't painted it since?"

"No—I haven't the time or money for such frills—I'm a farmer—not a painter."

"Yes," broke in my travelling companion, tapping on the rusted metal with his pipe for emphasis, "but if you had spent a dollar a year on good paint—say seven dollars in all—you wouldn't be buying a new harvester this year and that pretty daughter of yours would be going to town this winter to finish her schooling. That seven dollars would have been a mighty profitable investment."

"That sounds all right," returned Dick, "but I tried it once. When I painted the house in '98, I had some paint left over, so I painted the plow. It came right off—didn't do any good."

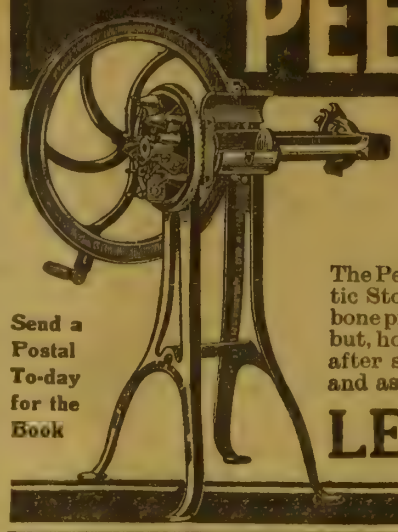
"Of course not—the paint that was made to stick to wood couldn't hold of the hard metal. You can't expect every medicine to cure every disease or one paint to do good work on every sort of surface. That's why the most reliable manufacturers make special paint for every surface and every use. Seven dollars on a good implement paint—one dollar a year—would have kept the old harvester as good as new. Its the same way with the barn."

"Oh there's no use in painting the barn—it's not worth it. I've got to build a new one anyway. The rain goes right through this and spoils the hay."

"It didn't do that the year it was built, did it?"

"No—of course not. It was a good barn then."

"Why didn't you buy a good grade of paint made especially for barns



PEERLESS GREEN BONE CUTTER

For half the cost of wheat, you can feed your flock succulent green bone—the most perfect egg-producing food known. A pound of green bone, costing but a single cent, will feed 16 hens for a day. Per hen, that is only

1/16c. PER DAY

The Peerless Positive Feed and Automatic Stop Green Bone Cutter cuts green bone properly; it does not grind the bone but, holding it endwise, cuts off shaving after shaving—as bone should be cut, and as it is most easily digested and assimilated. Write for our book—sent FREE—telling all about how to feed green bone to your flock, about its economy, its muscle-forming values and its wonderful egg-producing properties. A postal will bring it to you. 101

LEE Manufacturing Co., Limited 103 Pembroke Road PEMBROKE ONTARIO CANADA

If you are an expert pianist, five minutes study of the SHERLOCK-MANNING will show you why it offers the best value you can get. If you are not, you must—at best—buy on looks-plus-faith. Any piano has looks—that's mere furniture-making. But if you'd take the time to visit our factory you'd see at once why SHERLOCK-MANNING Pianos have the kind of appearance that endures. It's all in the special processes we employ. They'd interest you—and convince you as well.

But don't buy a piano for beauty's sake alone. You want tonal excellence---and you want to be sure that it will endure, too. Again---a visit here would prove to you---though a novice ---why that is assurred you in this superbly built piano.

If you are too far away to visit the factory we will tell you where these splendid instruments may be tested near home.

20th CENTURY, STYLE 110

Price, too, is a factor. There are sound reasons why you are able to save at least $100 by buying a SHERLOCK-MANNING Piano---and yet you will get just as much as you possibly could if you spent the $100 more for another make.

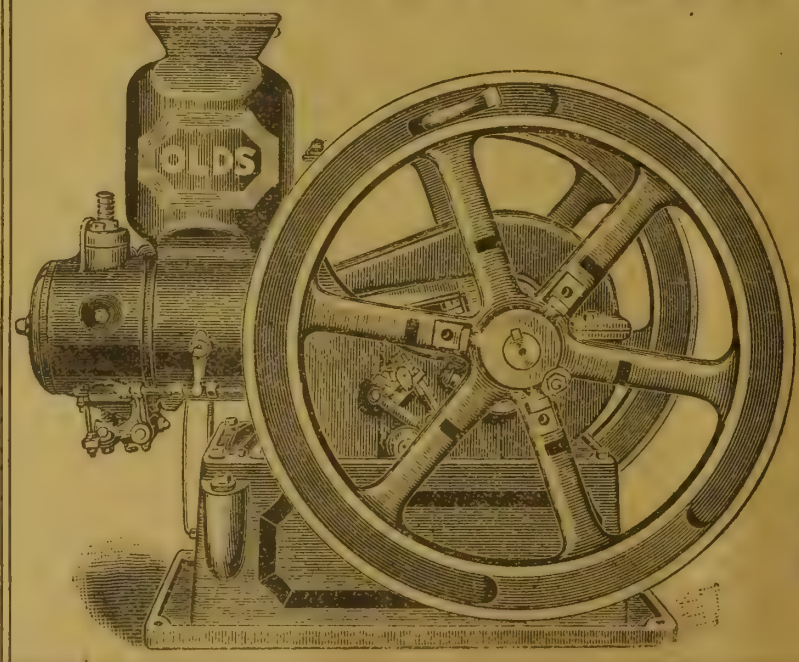
All this suggests a visit---or at least a request that we will make plain to you some piano facts worth your knowing. Will you call---or write---to-day?

If you do not know the SHERLOCK-MANNING dealer near you, write us and we will gladly introduce you to him or we will give you full information by mail direct. You will save money by writing NOW for our catalogue.

SHERLOCK-MANNING PIANO & ORGAN CO., LONDON, CANADA

(No Street Address Necessary)

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

The Wheel That Has Made GOOD!

Reduce Farm Labor 25 to 50 Per Cent.

Put T-K Wide Tire Steel Wheels on your wagons and you can haul 25 to 50 per cent heavier loads without causing any heavier draft. Our steel wheels make heavy loads light and are so durable that they will stand any strain over the rockiest road. They last a lifetime with practically no attention.

TK Handy Farm Wagons and Wide Tire, Steel Wheels

Our Handy Farm Wagons are acknowledged to be the best all-purpose wagons ever used on a farm. They have a lighter draft and are easier to load and unload than all the others. We guarantee them to be great money-savers and the best trucks on earth for the price.

Write and ask about them.

Tudhope-Knox Co., Limited, Orillia, Ontario.

ABSORBINE

will reduce Inflamed, Swollen Joints, Bruises, Soft Bunches. Cure Boils, Poll Evil, Quitor, Fistula or any unhealthy sore quickly; pleasant to use; does not blister under bandage or remove the hair, and you can work the horse. $2 per bottle, delivered. Book 7 E free.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Send Us Only $1.00

Receive by return mail post paid two beautiful little dresses like cut in soft warm dress goods in dark red plaid patterns for little girls age 2 to 8, made with waist and skirt trimmed with braid in latest style. Age 10 to 12, 75c. Age 14 $1.25, add 14c for postage. Standard Garment Co., 16 Standard Building, London, Canada.

"There could be no better medicine than Chamberlain's Cough Remedy. My children were all sick with whooping cough. One of them was in bed, had a high fever and was coughing up blood. Our doctor gave them Chamberlain's Cough Remedy and the first dose eased them, and three bottles cured them," says Mrs. R. A. Donaldson, of Lexington, Miss. For sale by All Dealers.

and rough lumber of all sorts. Unpainted wood cracks and shrinks and lets the rain in. You probably lost enough every year in damaged crops to pay the cost of painting several times over. It's merely a case of spending money to save money."

Dick pulled on his pipe without speaking. "H'm," he said finally; "maybe you're right. I guess I never looked at it that way." He kept silent for a few minutes. "Say," he exploded suddenly, "do you think it's too late to save the barn?"

"Of course not," answered my friend. "Paint it this fall the minute your harvest is safely in. The wood will be in perfect condition to receive the paint after the summer sun has dried it thoroughly, and the weather will probably be clear and settled. That's one reason why there is no better time to paint than fall. The other is that your buildings are properly protected and ready for winter's frost and snow. Frost is mighty bad on wood because it goes in so deep and splits and cracks the timber. There's one thing more—when you go to town for paint don't try to see how cheap you can get it. Ask your local dealer or look in your farm papers for the name of a reliable paint of established reputation. The good paint will cost you a little more this year but you won't need to do it all over again so soon.

This June I stopped off again at the little town and drove up to my friend's home. House and barn were attractively painted. Nowhere could you see a machine or wagon exposed to the weather. I turned in. Dick greeted me from the porch and called his wife.

"I'm sorry," said he, "that my daughter isn't here too."

"Where is she?" I asked.

"Oh!" said he, "she comes home from the Academy to-morrow for her summer vacation."

Quit wasting your pumpkins by gorging the hogs and cattle to them for a few days during the fall; then allowing your stock to be without this most valuable feed for the rest of the winter.

Pile your pumpkins in a row, as high and as wide as you wish them; cover them with a little hay; and set up fodder stacks of four feet thick on each side. This not only protects them from the cold, but as you feed out the corn and fodder, "the golden fruit of the vine" is handy, and a fine balanced ration is quickly and easily formed in the dead of winter. Can you think of a more profitable method of storing pumpkins?—M. Albertus Coverdell.

Cost of Concrete Tile.

K. B., N. S.—What would the cost per foot be for concrete drain tile 6 inside diameter?

Ans.—Drain tile 6 in. in diameter should be 3-4 in. thick made in lengths of 18 in. The amount of materials needed per 100 feet would be 11 1-9 cubic feet of gravel not larger than 3-8 in. and 2 3-4 bags of cement. These quantities are based on the proportions of one bag of cement to four cubic feet of gravel. The cost would vary with the cost of mater

A MAN'S BOOK.

A PRIVATE TREATISE, WITH ILLUSTRATIONS, RELATING TO DEBILITY, ITS CAUSE, EFFECT AND HOME CURE.

Let Me Send It To You FREE

Here is a little volume of cheer and helpfulness which old men, young or out, can read with great profit; it contains much valuable information, of a private nature, is fully illustrated, and represents the practical knowledge I have gained from forty years of actual experience in giving help to upwards of 100,000 unfortunate, but encouraged men. Just a postal card with your name and address and the book will be forwarded free, sealed, by return mail, and with it as well, I will enclose a full description of my new 1910 model Electric

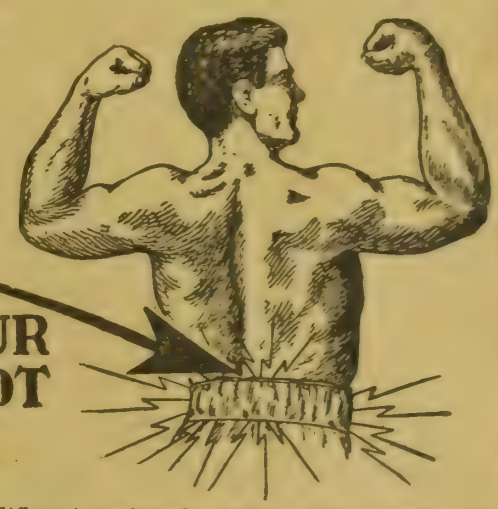
Health Belt

If you need new strength, this wonderful appliance must appeal to you. It generates a pleasant, exhilarating currant instantly felt, though it can be made any degree of strength from mild to strong by simply turning the needle of the current regulator; worn nights while you are sleeping, it pours quantities of health-giving, soothing electricity into your sick, weak nerves; you get up mornings feeling bright, strong, full of courage and ambition; it takes all the weakness and pain out of your back it is a great remedy for your kidneys, bladder, stomach, liver and other vital organs; it cures rheumatism in all parts of the body; it is a courage-giver of the highest order; it brings new strength where weakness exists; it will restore you to vim, vigor and true manhood as sure as night follows day' it makes you feel young and look young; you will live longer for its use; you can throw away all drugs and commence to live as Nature intended you should—a man among men, healthy, happy and vigorous. I can send you thousands of testimonials if you care to see them. Here is a sample Cure:

"Your Health Belt cured me of Nervous Debility, Lost Vigor, Kidney and Bladder Troubles after all else failed

"CHARLES L. SNELL,
"Middleport, N. Y."

In all instances I concentrate the full positive current at small of back; it thus enters the system at the nerve and vital centre,



passing thence through the different weakened organs, giving them new life and force. You can get the Belt.

ON TRIAL UNTIL CURED

or for cash at a discount, just whichever you wish. Send you address on postal or fill in coupon; or call at my office, if you live in or near this city. Advice concerning your case will be cheerfully given without charge or obligation.

DR. M. F. SANDEN CO., 140 Young Street, TORONTO, Ont.

Dear Sirs—Please forward me your book as advertised free.

NAME ....

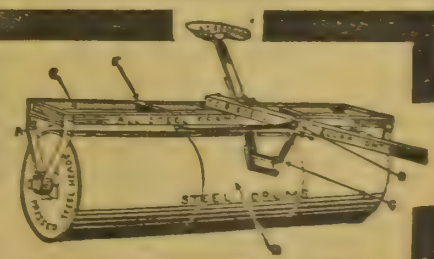
ADDRESS ....

The "Bissell" is a 3-drum roller

3 DRUMS make the best Land Roller. It is easy to understand how the "Bissell" Roller with 3 drums and supported by 6 heads is a STRONGER IMPLEMENT than any 2 drum Roller on the market. With 3 drums the centre bearing is not needed. When the "Bissell" Roller is at work, the axle turns with the drums.

It costs more to manufacture the 3 drum Roller than the 2 drum, but you pay no more for the "Bissell" 3 drum and get BETTER VALUE FOR YOUR MONEY. You get heavier weight in the "Bissell" drums too.

The good points cannot all be told here. Ask your dealer about the "Bissell" Roller and do not be put off with a Roller unless the name "Bissell" is plainly stencilled thereon.



Grass Seeder Attachment furnished if required. Write Dept. M for free catalogue.

T. E. BISSELL CO., LIMITED, ELORA, ONT.

BAD BLOOD CAUSES BOILS and PIMPLES.

Get pure blood and keep it pure by removing every trace of impure morbid matter from the system.

Burdock Blood Bitters has been on the market about thirty-five years, and is one of the very best medicines procurable for the cure of boils and pimples.

PIMPLES CURED.

Miss J. M. Wallace, Black's Harbor, N.B., writes:—"About five years ago my face was entirely covered with pimples. I tried everything people told me about, but found no relief. At last I thought of B.B.B. and decided to try a bottle. After finishing two bottles I was entirely cured, and would advise any lady who wants a beautiful complexion to use B.B.B."

BOILS CURED.

Mrs. Ellsworth Mayne, Springfield, P.E.I., writes:—"My face and neck were covered with boils, and I tried all kinds of remedies, but they did me no good. I went to many doctors, but they could not cure me. I then tried Burdock Blood Bitters, and I must say it is a wonderful remedy for the cure of boils."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

ials and labor. Assuming the cost of cement at $2.00 per barrel and gravel at $1.00 per cubic yard, the cost of cement would be $1.38, and gravel 41c making the total cost of $1.79 per 100 feet. If the tile are made by a hand machine, the cost of labor being 20c. per hour, per man, and the man making 30 feet of tile per hour, the cost of labor for 100 foot of tile would be 67c, so that the total cost of 100 feet of tile would be $2.46.

The Potato Digger.

No one who has seen the modern machine potato digger at work has failed to be impressed by its wonderful efficiency, and the speed and thoroughness with which it lays the potatoes on the surface of the earth, well separated from clods and ready for instant picking up. It is indispensable for any grower on a large scale, for whom in time and labor saved it quickly pays for itself. Smaller growers will do well for themselves by co-operating in the purchase of one for the use of all. It is quite likely, too, that they will find themselves able to save more money with it by hiring it out to others, or by working it for them, for it will surely be in demand by those who have seen it work.

NEVER before has such rich fullness, such delicate smoothness of flavor been within your reach to multiply the keen enjoyment of your tea-cup!

Because King Cole tea sets a new and higher flavor standard. It is blended to excel even those good teas which you and your neighbors had always held as favorites.

The delightful vigor of its flavor, the delicious zest of your very first cup of King Cole tea, will make it your life-long friend.

Why not tear this out as a reminder to ask your grocer for an introduction to King Cole?

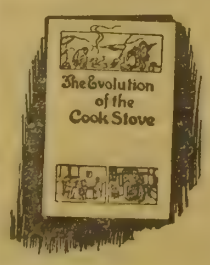
Here is a Book Worth Having

IT tells about cooking from the time the Cave Dwellers used to put hot stones in the pot to boil it. The Book contains interesting information gathered from many sources and is illustrated profusely.



The "Evolution of the Cook Stove"

also tells all about the "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy this book.

Write for free copy.

"DOMINION PRIDE RANGE"

you get a full dollar's worth of actual stove value for every dollar you pay.

The "DOMINION PRIDE" is made of tough, strong malleable iron and the best blue polished steel—materials that will neither warp, crack nor break, so that it will last a lifetime. It is made in the largest Malleable Iron Range Works in Canada, and each range is backed by our unconditional guarantee.

The "DOMINION PRIDE" looks well, cooks well, saves fuel and is easily cleaned. You'll be proud of its neat, handsome appearance in your kitchen, and of the appetizing food it will cook to perfection for you. You'll appreciate the ease of keeping its blue polished steel surface and the bright polished top spick and span with a few rubs of a cloth. Your husband will be more than pleased with the reduction in the coal or wood bill—for the "DOMINION PRIDE" saves, by actual tests, 30% of the fuel.

A "DOMINION PRIDE" Range, with High Closet Shelf and Elevated Tank or Flush Reservoir, with Zinc Sheet to go under range, 8 sections Blue Polished Steel Pipe and 2 Elbows, will be delivered to any Station in Ontario, Quebec or the Maritime Provinces for $41, or to any Station in the Four Western Provinces for $49—$5 to be sent with order and balance to be paid when Range is delivered at your Station. If not convenient to pay cash we will arrange to accept your note.

Utilizing Dormant Natural Resources.

(Continued from page 113).

bred stock raising can be over estimated, I believe the importance of general or mixed farming should stand in first rank as it is on the latter system of farming the masses are depending for a living.

The men who specialize in stock breeding and fruit growing are in the minority and are already numbered in the ranks of the wealthy or independent class.

Experience has taught me that demonstration farms are the only or at least the quickest way to get the ordinary farmer out of the rut.

I am going to repeat the cry to the new Premier and perhaps it will be heard, as the time is now drawing near, when the outskirts of the province will be quite as important as the centre.

DARE TO BE A DANIEL.

I do not believe it possible for a man to obtain the highest returns from the soil unless he is a student of divine or natural laws. I have got more instruction and ideas in scientific farming from the Bible than from all other sources combined. I have had the satisfaction of transforming many passages of scripture which, according to ordinary expoundings, appear to me as mere spiritual appendices into valuable literal instruction in agriculture.

We are told that God fed the Israelites, in the wilderness, on manna, When they arrived at a place where they could work for their bread he withdrew the miraculous food. When Christ saw the hungry multitude he had compassion on them and miraculously fed them.

We have outlived the days for the necessity of the miraculous production of bread. We are now required to study out the natural laws of production by the proper use of the intelects given us by the same power that created those laws. If we violate the order of those laws, the result will either be only partial success or total failure.

Are our Agricultural Fathers following the dictates of Nature's orders?

We are told, according to the description given in the book of Genesis, that the Vegetable Kingdom was created, or, put in modern language, "evolved" before animals were created. If this were not the case, what would the animals eat? Their food would have to be imported from Mars or some other older planet.

Notwithstanding the absolute necessity of live stock on the farm, I do not consider their presence indispensible in the rapid upbuilding of the soil.

It appears to me, the proper thing to do is to first instruct the hungry multitudes of farmers—the main producers of food for the consumers—how to produce the food and the pure bred stock will naturally follow. A starved, pure bred animal is the most unprofitable kind of a scrub.

No doubt I may get some rebuke for my daring, radical departure from time-worn Agricultural Orthodoxy, but I am willing to take it if I can stimulate some other farmers to deeper thought and better action in utilizing the valuable natural resources now lying dormant under their feet.—D. MacDougall, Westmorland Co., N. B.

ONE GOOD FEATURE OR EVERY FEATURE GOOD WHICH?

AS long as a cream separator skims close, it is a good investment. But one good feature or a few good features do not make a separator that will skim close for any length of time.

A good separator is one in which the minor parts have been just as carefully designed and just as well made as the most important parts. A defect in a minor part will, by throwing the entire machine out of adjustment, offset all the perfection attained in any other part of the machine. In the

I H C Cream Harvesters

Dairymaid and Bluebell

one feature does not overtop all others because the same I H C standard of quality in design, material, and workmanship is maintained throughout. They are the only separators with dust-proof and milk-proof gears which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. These separators have large shafts, bushings, and bearings; the flexible top-bearing is the strongest and most effective found in any separator. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated. I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes.

The I H C local agent will be glad to let you examine one of these separators, or, write nearest branch house for catalogues and other information.

MAXWELL'S HIGH SPEED CHAMPION

Is The Most Satisfactory Washer Ever Placed On The Canadian Market

Last year, Maxwell's "Champion" was the recognized leader of all high speed washing machines. This year, we have put the final touch to it, and offer you the ideal machine, that includes every important improvement known to modern washers.

Maxwell's "Champion" has the largest opening of any washing machine. As you can see, the Wringer attachment is at the side, and practically the whole top of the washer opens up. This makes it easy to put in and take out clothes.

No other washer has this feature. No other washer can be worked with crank handle as well as top lever

In design, finish and appearance—in ease and quickness—in service and durability—Maxwell's "Champion" is the peer of them all. If your dealer does not handle it, write us for illustrated catalogue.

Have better butter. Use Maxwell's "Favourite" Churn. Recommended by best butter makers the world over. More of them used in Canada than any other. All sizes from ¼ to 30 gallons.

DAVID MAXWELL & SONS,
ST MARY'S, ONT.

Terms Used in Dynamiting.

We have an inquiry from one of our readers regarding the terms "Mudcapping," Snakeholing" and "blockholing" which appeared in an article on the use of dynamite on the farm, in a recent issue of the Maritime Farmer. We have had several interesting inquiries in regard to the use of dynamite on the farm and we take pleasure in publishing an article and some cuts in this issue about this matter.

The operations of "Mudcapping," "Snakeholing" and "Blockholing" are explained to us for publication by Prof. F. H. Sexton of the Nova Scotia Department of Technical Education, as follows:

MUDCAPPING—When blasting boulders by mudcapping them (also called "doby shooting" or "blistering") the charge of dynamite is packed closely against the surface on the top or side of the boulder, covered with mud and exploded. The charge should be placed on the spot which would be struck with a sledge if the boulder were small enough to be broken in that way and should be packed in a solid mass by slitting the paper cartridge shells, but not spreading them over the surface of the boulder any more than absolutely necessary. A blasting cap crimped onto fuse should be placed in the middle of the charge, and the whole covered with six inches of damp clay or sand. This should be pressed firmly over the mass of dynamite, care being taken not to cover the outer end of the fuse. If the boulder is deeply imbedded in the ground, it is best, before blasting, to dig away or loosen some of the earth surrounding it.

If the boulder is cracked or seamy, the charge should be placed in some depression and covered with a quantity of clay or sand. This will furnish more resistance and secure greater force from the explosives.

The quantity and strength of dynamite required naturally depend on the size and shape of the boulder. The "grain" and kind of rock are also important points. 60 per cent Dynamite is best for mudcapping boulders. The following table gives approximately the number of 1¼x8-inch cartridges to mudcap boulders of different sizes, so that they will be broken into pieces small enough for one man to handle, provided the boulders are mostly above the surface of the ground.

Weight of Boulder	Approximate No. of 1¼in.x8in. cartridges
100 lbs. to 500 lbs.	½ to 1½
1000 lbs.	2
2000 lbs.	3
3000 lbs.	3½
4000 lbs.	4
5000 lbs.	4½
7500 lbs.	6
10000 lbs.	8

If boulders are largely buried in the ground they may be broken by doubling or trebling the above charges, but it is better under these conditions to lift the boulder out of the ground by snakeholing and then break it in pieces by mudcapping.

SNAKEHOLING—In this method of breaking boulders the dynamite is placed in holes underneath them just as in stump blasting. The hole is made with a crowbar or dirt auger in such a direction that the charge of dynamite will be against the center of the lower side of the boulder. If the boulder is hollow or flat underneath, the explosion of the charge will break it in pieces and throw it out of its bed. If the lower side is round or bulging the boulder will be heaved out, but will not be so well broken. When this occurs the large pieces may be broken by mudcapping. Care should be taken when the charge is placed to leave no means by which the force of the dynamite may escape. If it has not been thoroughly tamped or if it is too near the surface of the ground and not in the proper position beneath the boulder, the dynamite may blow the dirt out and leave the boulder untouched.

60 per cent. Dynamite should be used when breaking up boulders in this way. Only from one-half to two-thirds the quantity that would be required to mudcap the same boulder is needed, provided it has a hollow or flat side underneath. The results are better in damp, heavy soil than in light or sandy soil.

BLOCKHOLING—In "Blockholing" one or more small holes are drilled into the boulder and blasted in the ordinary way. This is the most economical way to use dynamite in breaking up boulders, although it takes some time and labor to drill the one or more necessary holes in the boulder. The holes in large boulders should be an inch or more in diameter, while three-quarters or seven-eighths of an inch will answer for the smaller ones.

A boulder weighing from eight to ten tons can be well broken by drilling a one-inch hole in it near the center from eighteen to twenty-four inches deep, as the shape and grain of the rock may demand, and exploding in the hole two or three 1¼ x 8-inch cartridges of 60 per cent. Dyna-

Weak Men, Read

Perfect health and strength denote the absence of disease. When you are weak it means that you lack that which is the foundation of strength—of life itself—Electricity. You may be afflicted with Rheumatism, Dyspepsia, Lame Back, Weak Kidneys, Nervous Debility, Sciatica, Constipation or any of the numerous diseases which lead to an early breaking down of the system. If you have any of these troubles they should be attended to at once. You have tried drugs, and found that if they even stimulated you they did not cure, but left you with some new trouble as a result of the poison put into your system.

It is pitiable to think of the vast number of men who go on from day to day suffering mental and physicial torture as a result of their weakness, while right at their doors other men are being cured of the same disease. One who has not known it himself cannot realize the feelings of a man in an advanced stage of Nervous Debility, nor does he hear it, for these men do not talk of their troubles. Even when they are fortunately led to use the remedy which is now so well known—Dr. McLaughlin's Electric Belt—and are cured by it, they do not mention it to their closest friends; hence the prevalence of this trouble, and the means of cure are appreciated only by those who have had experience. And yet I have thousands upon thousands of grateful patients who are willing to testify to their cures by

Dr. McLaughlin's Electric Belt

and who would be glad to share their knowledge with others if writtten to. I send the names of these men to any one who requests them. There is not another remedy in the world to-day that has proven as effective. Its cures speak volumes for the good work it has accomplished. My confidence in my method enables me to offer to any man or woman who will offer me reasonable security to use the Belt at my risk and

PAY WHEN CURED

If I don't cure you my Belt comes back to me, and we quit friends. You are out the time you spend on it—wearing it while you sleep—nothing more.

Dear Sir,—I have used your Belt since last November, and I feel much better. The emissions have stopped entirely. I am well pleased with the Belt. It has proved all you claimed for it.

Yours respectfully, Daniel Chatterton,
Cobalt, Ont.

Dear Sir,—I am glad to say that your Belt has made a permanent cure of my case. After using the Belt and following directions for three months I felt like a new man, and have not used it since. As it is now over eighteen months since I stopped using the Belt, and have had no return of my trouble, I find I am cured, and words cannot express the gratefulness I have towards you and what your Belt has done for me. Before using your Belt I weighed 140 and now I go 170. I am recommending your Belt to all my friends. I remain, yours truly,

Leon Rolfe,
Lime Ridge, Quebec.

Dear Sir,—I have worn my Belt for a month, and I am well pleased with the results. I feel better in every way; have a good appetite, and my food digests well. Yours very truly,

Ira S. Acker,
Birchtown, N.S.

Dear Sir, I have worn your Belt for a month now, and I am glad to say that I have received the greatest benefits from it. My back is a great deal stronger, and the pain in my legs and arms have gone and I am feeling like a new man already. You may use this letter in an yway you wish. Wishing you every success, I remain, Yours truly,

William McConnell,
Bon Acord, Vic. Co., N.B.

I cannot take up more space with those extracts. But if you will send me your address I will mail you free my beautifully illustrated book, along with testimonials from thousands of grateful people, who have been fully restored to health and strength.

This appliance has cures in almost every twon and city in the country, and if you will write me I will send you testimonials given to me by people that are probably well known to you. My Belt not only cures weakness, but Rheumatism, Sciatica, Lumbago, Backache, Kidney Trouble, Nervousness, Constipation, Indigestion and Stomach Trouble. I have a beautiful 80-page illustrated book, which I will mail, sealed, to any address, FREE. This book is full of lots of good, interesting reading for men. Call today. If you can't call, send coupon for Free Book.

mite. As it is best to have the dynamite well down in the hole so that as much tamping as possible can be packed above it, the dynamite should be poured out of the shells and packed down into the hole with a stick. When it is all in place a hole is made in it with a sharp stick and the blasting cap, crimped to the necessary length of fuse, is pushed down into this hole and held in position by carefully packing the clay tamping about the fuse.

To break up a boulder weighing approximately a ton a one-inch hole, eight inches deep, charged with from two-thirds to one cartridge of the same size and grade of dynamite, is required. Smaller boulders require holes from four to six inches in depth, which, if necessary, can be filled full of dynamite, and no tamping used.

Lime in the Creamery.

The brightening, sweetening, disinfecting and preserving qualities of lime and its cheapness in price are well known. These are qualities that should appeal to prudent dairymen and in recommending the more extended use of this valuable commodity we give in the following a few suggestions as to its preparation and use in buildings used for dairy purposes.

1. Place freshly burned lime in a tight barrel or tub, pour on sufficient hot water to cover the lumps of lime and keep well stirred clear to the bottom. A piece of iron pipe makes a good stirring stick. If the lime is very "quick" two persons may be required to slake it, one to pour on the water as it is needed and the other to stir it. The adding of the water and the stirring should be kept up from the time the lime begins to slake until it is reduced to a smooth paste. It is not absolutely necessary that hot water should be used but unless the lime is very "quick" hot water facilitates the operation and results in more thorough slaking.

2. The thorough slaking of lime is an important operation and should be done with care. When lime is allowed to slake without being stirred the results is, generally, that a portion of it has not come into contact with the water at the right time and the white wash made from it will be full of small, hard lumps which were not slaked. Lime that is "burnt" or "drowned" in the slaking process is loose or flakey in texture when applied.

3. In preparing the surfaces of a room for whitewashing all loose flakes of old whitewash, dust, cobwebs, mold, etc. should be carefully brushed or scraped off, so as to leave an absolutely firm surface upon which to apply the lime. It is advisable to have the whitewash quite hot for the first coat, more especially if there be the least suspicion in the cracks or crevices of the ceiling, walls or floor. The whole surface should be carefully covered with lime. If the first coat does not cover completely, or if it be applied upon a surface upon which there has been a growth of mold, another coat should be applied as soon as the first has become dry.

4. We strongly recommend every creamery to keep on hand a supply of well slaked lime and to use it not only for the purpose of occasionally whitewashing the storage rooms and the interior of the creamery but also in the daily cleansing of churn and other utensils and in the scrubbing of floors. A small quantity of well slaked lime mixed and used with the hot wash water will effectively remove sour and disagreeable smells from utensils and floors.

5. In washing the churn with lime care should be taken to have it thoroughly rinsed shortly afterwards with clean boiling water so as to remove the undissolved lime, as otherwise it will form a crust on the inside surface of the churn and possibly afterwards become mixed with the butter which, of course, should be avoided.—C. L. Marker of Alta in Farm and Dairy.

The Cotswold.

The Cotswold sheep takes its name from a range of bare hills in the counties of Gloucestershire and Worcestershire, England, which it has inhabited for a very long period. It is said that the hills take their designation from the sheep rather than the sheep from the hills. They derive their name from 'cote,' a sheepfold and 'wold,' a naked hill. Historians of the breed describe the original stock as being long-necked, rangey, square of build with strong bone and clothed with fine, soft wool. As early as 1464 sheep of the Cotswold breed were by royal consent exported to Spain to the great advantage of the Spaish flocks. This and other evidence seems to point to a fine-woolled breed quite dissimilar to the long-woolled specimens of modern years. For a period subsequent to the date mentioned there seems to be nothing definite written about them. Two or three centuries later Professor Low, writing of the Cotswold sheep, gives the impression that they are the offshoot of the Midland long-woolled breed inhabiting the level lands.

From the accounts of the various writers it appears safe to infer that the blood of the original fine-woolled Cotswold and the longer-fleeced Midland sheep were fused in the Cotswold of the eighteenth century. Then the blood of the Leicester was introduced which worked a great improvement in the breed from a mutton standpoint. About this time many of the old pastures were being broken up, turnips and cereals began to be cultivated, bringing about conditions favourable to an increase in weight of carcass and length and strength of wool. Cotswold breeders have for a long time preferred and bred for a bold and open curl in the fleece rather than the close spiral of the Leicester. In the early years of the breed grey or light brown speckles on the face or shanks were not looked upon with disfavour, and even at the present day these markings are to be seen in individuals of many of the best flocks, although the Cotswold is looked upon as a white-faced breed.

Whatever the origin of this sheep it is certain that for the past seventy years at least it has been kept pure, so that the type has long since been thoroughly fixed. The Cotswold may be described as a big, upstanding sheep. Compared with the Leicester the Cotswold is somewhat larger and stronger of bone. It is not so broad in the back but possesses greater depth of body. In addition the hind quarters are more squarely developed. A distinguishing characteristic of the Cotswold is the topknot or fetlock which is never shorn close to the face, extending in some cases to the point of the nose. The fleece is heavy, wavy and rather coarser than that of the Leicester, and should weigh from 10 to 15 pounds of fairly clean but unwashed wool. It should cover

The Most Serviceable Cow Stanchion

The strongest, neatest and best Cow Tie made. Combines the good qualities of both neck chain and wooden stanchion as it gives the cow perfect freedom to move and turn her head, but does not let her step forward into the manger or back into the gutter. Easy to open and easy to close.

FOR CHRISTMAS

Interesting Pages in Brown's New Jewellery Catalogue

¶BROWN'S New Jewellery Catalogue has proved an immense success, and if you are not on their mailing list, be sure and write **To-Day** for a free copy. Certain pages are particularly interesting for this Christmas season. A few are mentioned herewith:

Page 5. A beautiful collection of inexpensive Rings, in colors, some set with diamonds, ranging in price from $2.00 to $30.00.

Pages 4 & 6. Amethyst, Peridot and Pearl Jewellery—all 14k carat solid gold. Prices from $2.50 to $40.00.

Pages 14 & 15.—A very fine range of inexpensive Brooches, Bar Pins, Links, Scarfpins, Necklets, etc., all gold filled and set with extra fine imitation stones. Prices from 35c to $3.00.

Page 19. Silver Necklets, Brooches, Safety Pins, Charms and Hat Pins, set with Real Amethysts and Connemara Marble. Prices from 25c to $3.00.

Page 20. Lodge and Emblem Pins, Fobs, Rings, Charms, etc., in solid gold and gold filled, including, Masonic, Oddfellows, Foresters, Knights of Columbus, etc., Prices from 50c to $8.00.

Page 31.—A full line of Ebony Toilet ware with silver letters and monograms. Brushes, Mirrors, etc.

Pages 35 & 36.—Smokers' articles, Pipes, Tobacco Pouches, Cigar and Cigarette Cases, Gold Headed Canes, Shaving Sets and Stands.

And many other pages brimfull of articles, useful dainty, and ornamental, all suitable for Christmas gifts.

M. S. BROWN & CO., LTD., JEWELLERS
Established 1840 HALIFAX, NOVA SCOTIA

To Make the Farm Kitchen Comfortable

for the winter as far as heat is concerned, and comfortable also in the sense that there will be no friction on account of badly cooked meals, you should purchase an

Enterprise Monarch Steel Range

With it's heavy castings, large fire box for wood burning, improved labor saving devices and small fuel consumption for the work done, it is just the range every farmer as well as city man should install in his home.

Note the extra large reservoir which heats water to the boiling point in double quick time, so that for lots of hot water and a sure oven you can bank on the MONARCH every time.

Write us for circular giving illustrations and full particulars of

"The Range for Those Who Want the Best."

The Enterprise Foundry Co., Manufacturers. Sackville, N. B.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Kellerstrass Strain

Good large vigorous birds, four and half and four months old. Price $2.00 and $3.00 each. If you want a nice bird write at once and get first choice.

B. C. CLARK,
Bear River, Digby Co., N. S.

For Sale

We are offering at a very low figure the Holstein Bull (Victor of Fairmead) rising four years old, weight over 1800, Sire Jacob Van Voran, (twice Grand Champion, Charlottetown, over all Dairy Breeds), Dam Beauty of Fairmead, a Show Cow. "Official" record made five days after calving, 455 lbs. 14 oz. milk and 17 1-2 pounds of butter in seven days—gave 12000 lbs. of milk this year on ordinary feed.

This bull won 2nd in class of five at Charlottetown this fall, and is an exceptionally fine animal in every way. Write for particulars to

LEA & CLARK,
Victoria, P. E. I.

the body in all parts. As a rule the best specimens are clothed to the fetlocks of the hind legs. Like in the Leicester the head is carried quite erect. The neck is rather longer and in many cases shows lack of plumpness, giving a 'ewe necked' appearance which should be reduced as rapidly as possible wherever it is found to exist.

The Cotswold breed stands in high favour both in Great Britain and abroad. Numerous flocks of pure-breds and grades are to be found in France, Germany, Australia, New Zealand, the United States and Canada. They are quite hardy and sufficiently prepotent to stamp their characteristics upon their offspring when crossed with other breeds. The average weight of a mature Cotswold ram in good flesh is about 250 to 30 pounds, and of a ewe 190 to 225 pounds. Highly fitted show-yard specimens reach higher weights than these. They require good pasture but do well on moderate elevations that are not too rugged. The mothers are, as a rule, good nurses and are, therefore, adapted to the production of lambs for the early market. The fattening qualities of the breed are good although the flesh is only moderately fine in grain if allowed to reach more than maturity. As a rule stock that is not to be kept for breeding should be fattened and marketed before they are fifteen months old.

Christmas Trees are Shipped Via I. C. R.

At many places along the line of the Intercolonial Railway spruce saplings intended for Christmas trees are being delivered for shipment to cities in the United States. The shipment of trees for the little ones of the neighbouring republic has become an industry during the past few years, and it is evident that the forest resources in the States will not supply the demand, so the Americans have to look to Canada for their Christmas decorations. The trees being green and flexible are packed on flat cars in large quantities and sent to dealers in Boston, New York, Chicago, Detroit and even as far as St. Louis.

THE ANNUAL MEETING

OF THE

CANADIAN GUERNSEY BREEDER'S ASSOCIATION

Will be Held in the Board Rooms of the

WINTER FAIR BUIL ING, AMHERST, N. S.,

ON

WEDNESDAY AFTERNOON DEC. 6, at 2 o'clock.

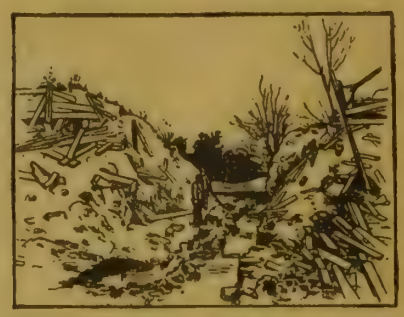
PEDLAR Nestable Corrugated Galvanized CULVERT

Is The Strongest, Most Practical, Durable and Easiest Laid Culvert Made

YOU ought to show this advertisement to your township reeve or warden. Get him to write for the free book about Pedlar Culverts, or write for it yourself and tell him about this new Culvert—the quickest, most economical, strongest for any use any culvert can serve.

See How It Saves Farmers' Money, Betters Roads, Lowers Taxes



This picture is from a photo of a washout fourteen feet deep in the Township of Darlington, caused by use of cement tile for drainage purposes. The township authorities have replaced that with Pedlar Perfect Culvert, forty feet in length by three feet in diameter; strongest, easiest laid and most durable they could get.

This picture of the Pedlar Perfect Culvert assembled and ready to lower into place, shows the immense strength and rigidity of these Culverts. Though forty feet long with a bearing of only a few feet at the centre it does not give one-sixteenth of an inch. See how easily Pedlar Culvert can be lowered into place. No skill needed.

Here you see the Pedlar Culvert doing its work of drainage twenty-five minutes after being put in place. It would have taken three times as long and cost three times as much to have installed any other type of culvert. Yet this Pedlar Culvert will last far longer and give no further trouble of any kind.

This view shows the Pedlar Culvert after the fill-in was completed. The Culvert has to carry a dead weight of several hundred tons of earth, as well as the live weight of traffic passing overhead. But that can't strain Pedlar Culvert, which will neither give nor spring. It stands what no other culvert can.

Write For My FREE Book No. 60 and Sample

And get a correct idea of what makes a good Culvert. Learn how Pedlar Culvert can be used on your farm.

Short Courses at the Agricultural College

TRURO, NOVA SCOTIA

January 2nd to 12th, 1912

The next Short Course for farmers and farmers' sons will embrace all the features in connection with Soil Cultivation, Live Stock, Horticulture, Dairying, Poultry and Veterinary Science that have made the previous Courses so valuable and popular. In addition, instruction in the running of Gasoline Engines will be added, for which purpose the various manufacturers will have their machines on exhibition. Particular attention will be given to Power Sprayers.

The Short Course for Ladies, held on the same dates, promises to be the most largely attended yet. The subjects taught will be Dairying, Horticulture, Poultry, Domestic Science, and students may attend selective classes from the above Courses.

Tution to students from all the Maritime Provinces FREE.

Board will cost from $3.50 to $4.00 per week.

All Railways gaant SINGLE FARE privilege.

For full particulars write

M. Cumming, Principal Agricultural College, Truro, Nova Scotia.

Eleventh Annual Maritime Winter Fair

Still it Grows.

Col. H. Montgomery-Campbell
President Maritime Stock Breeders' Association.

DECEMBER fourth, fifth, sixth and seventh, the dates on which the eleventh annual Maritime Winter Fair was held, were busy days in Busy Amherst.

Breeders of purebred and grade, beef and dairy cattle, sheep, swine and poultry as well as breeders of elite, hand selected and general crop seed grain and potatoes were out in strong numbers. Beekeepers and fruit growers were also well represented. Although several of the veteran exhibitors were absent, and they were missed, still we were pleased to note that any breach in numbers formed in this way, were more than filled by young and enthusiastic exhibitors.

The weather was mild and balmy, making it agreeable for exhibitors and visitors alike to move around with comfort and enjoy the educational demonstrations in the various departments of the fair.

Col. H. Montgomery-Campbell, the president of the Maritime Stock Breeders' Association, Secretary Manager, F. L. Fuller and their assistants in the various departments of the fair did everything in their power to make matters both pleasant and profitable for the visitors and exhibitors.

The citizens of Amherst noted the cramped condition of the dairy stables last year and went to work with their characteristic progressiveness, and built an additional ell, which they fitted up for more accommodations for dairy cattle. It was well this extra amount of stabling space had been provided as the Dairy Test is one of the most popular features at the fair, and one in which there is an awakening interest among the exhibitors themselves, so much that the number of entries were almost twenty per cent. greater than last year. The cold storage room has also been enlarged to accommodate larger numbers of dressed carcasses of beef, mutton, lamb and pork.

The rapidly increasing number of entries in the poultry department calls for a further extension of that musical and attractive section. All available coops were taxed to their utmost capacity. The poultry men look for extended cooping space before next year in order to avoid decking which would detract from the appearance of the show.

THE JUDGES

of the respective classes were :—Beef Cattle, W. R. Elliott, Galt Ont.; Dairy, W. A. McKay, Scotsburn, N. S., Mr. Porter of the N. S. A. C. staff and D. Drummond, Ottawa ; Sheep, John Guardhouse, Highfield, Ont., and C. M. McRea, Ottawa; Swine, C. M. McRae; Poultry, F. C. Elford, St. Anne, Dr. Bellevue, Geo. Robertson, Ottawa, and Seth Jones, Sussex, N. B.; Seed, L. H. Newman, Ottawa, and S. J. Moore, Truro, N. S.; Dressed Carcasses, W. R. Elliott, C. M. McRae and John Guardhouse ; Honey, W. A. Colpitts, Petitcodiac, N. B.; Fruit, S. C. Parker, Berwick, N. S. These gentlemen are past masters in their respective branches and the judging was done with all possible speed. The large number of entries in the open classes of the poultry department made it a difficult matter for the judge to get through with his work as rapidly as he and the exhibitors would like. The class is far too heavy for one man to judge in so short a time.

F. L. Fuller
Secretary-Manager Maritime Winter Fair, Amherst, N. S.

THE PUBLIC OPENING.

After the Stock Breeders' annual dinner on Monday evening, the public opening took place in the Auditorium. Col. H. Montgomery-Campbell presided and before introducing the speakers gave a short outline of the fair from the time of its inception. He eulogized the public-spiritedness and progressiveness of the citizens of Amherst and thanked them for their generous policy in regard to the Winter Fair and Horse Show.

For the fourth time in the history of the fair, His Worship Mayor Lowther said he was pleased to have the opportunity to say "welcome to the visitors and exhibitors at the Winter Fair." As Amherst continues to grow the Winter Fair building would also grow space, but when Amherst would cease to grow the Fair building would also cease to grow. Prospects were bright in Amherst ; the factories were taxed to their utmost capacity and Amherst properties were well worth looking forward to as safe investments for the citizens' slogan is "15,000 in the next few years." To show their faith in their slogan and to keep pace with other improvements, a school building costing in the vicinity of $50,000 was being erected. He told the visitors that the doors of industry in the town were open to them and advised each and everyone to visit the various lines of industry and see for themselves how the various lines are conducted that justify for the town the name Busy Amherst.

Warden Purdy of Cumberland extended a welcome to his county, a county on which nature has bestowed natural gifts of fertile soils, abundant forests and extensive coal areas which, coupled with a central location made Cumberland one of the best counties in the Maritime Provinces.

C. S. Sutherland, President of the Amherst Board of Trade, in referring to the Winter Fair said its success was due to its educational principles. He thought the time had arrived when the citizens of the town and the general public should look toward the erection of permanent buildings in which to accommodate the Fair. He thought the Maritime Provinces might combine to ask the Government to place their next Dominion exhibition grant at the disposal of the Maritime Stock Breeders' Association for the purpose of building a permanent home for the Maritime Winter Fair.

The manufacturers' and farmers' interests were so closely hinged together that the success of the one had an uplifting influence on the other.

Hon. O. T. Daniels, Attorney General for Nova Scotia was present and said he was delighted with the spirit of good cheer and co-operation that seemed to prevate the Fair. He would like to see this spirit of co-operation extended to other lines. He spoke strongly in favor of Maritime Union and said that in all probability, if such a union were to be consummated, Amherst, as the most central point in the Maritime Provinces, might become the new capital. He also referred to the good work that is being done by the Nova Scotia Agricultural College. In the upkeep of the N. S. A. C. as well as in Technical Education there was no just reason why the Maritime Provinces could not unite. Mr. Daniels set forth a plea for a spirit of optimism and boom to help invite immigrants to our civilization after which he declared the Eleventh Annual Maritime Winter Fair formally opened.

W. W. Hubbard, Secretary for Agriculture for New Brunswick replied to the addresses of welcome and in behalf of the visitors present thanked the citizens of Amherst for their kind treatment and hospitality. He also spoke very highly of the work that had been done by Messrs. E. B. Elderkin and W. W. Black in organizing the Fair.

Hon. E. H. Armstrong, Commissioner of Public Works for Nova Scotia also eulogized the spirit of co-operation that was so much in evidence at the Fair. The money spent in conducting the Show was well spent and he would gladly support any measure that would tend to the betterment of the Fair.

While he was not sure of the practibility of Maritime Union still he felt that there were many lines in which the three Provinces could co-operate, especially in Agriculture, for on it the prosperity of all classes depends. They could also combine to have their representation in the Federal House maintained as they have no means of expansion by acquiring new territory as the other provinces have. The Maritime Provinces were, as it were, tied down by the British North American Act and every effort to maintain the Maritime representation should be put forth even if the B. N. A. Act must be changed. He asked his hearers to do all in their power to advance technical education in Maritime Canada and ended his address by paying a high tribute to Professor Cummings' work at the N. S. A. C. in imbuing our young men with a sense of the great and good natural heritage we posses.

Rev. Dr. Ganthier of Prince Edward Island brought greetings from the Garden of the Gulf. He added his tribute of respect to the good-will and optimism of the citizens of Amherst. He also referred to the self-sacrifice of the P. E. I. exhibitors and the inconveniences experienced by them in trans-shipping their stock to and from the Fair. There should be more co-operation between the three Maritime Provinces in matters of common interest. The question of Immigration was an important one, but not so important as the emmigration of our own blood, our young men and our young women.

Measure should be adopted to keep our young people at home. Agricultural and general education would be a great factor in solving this perplexing problem. The N. S. A. C. at Truro was already shaping the destiny of our young people towards rural life and the farmers of the Maritime Provinces could not be too loyal or too patriotic to the College and its popular principal, Professor Cumming.

R. S. Carter, M. P. P. was pleased with the evidences of progress made by the Fair and pledged his support whenever opportunity offered.

J. L. Ralston, M. P. P. said the success of the town of Amherst was not due to its central location but owing to the spirit of optimism of its citizens. He touched on the problems of Immigration and Emmigration and said there was not much gain in trading comfortable eastern homes for western inconveniences. He wanted his hearers to stand up for the East, boast for the East and make the next decade that of the Maritime Provinces.

BEEF CATTLE.

The beef cattle classes were out in strong numbers and with fewer culls than on previous occasions. Some of the younger classes, although possessing good quality in abundance would have stood a little better fitting particularly in the grade lines. The total number of animals shown in the Shorthorn, Hereford and Grades classes numbered 132 only three less than last year.

HEREFORDS were shown by W. W. Black. As usual his white faces were in good, even, level shape and would merit stronger competition. The familiar figure of the late Wm. Robertson was greatly missed from the show ring. Since his demise, Mr. George Retson, of Truro, has been in charge of Mr. Black's herd and is proving his ability as a feeder, fitter and exhibitor.

The honor for female championship in the Hereford class went to the well covered, heavily fleshed, smooth Sylvan III of Amherst.

The honor for grand championship over all breeds went to Cup-bearer a two-year-old pure-bred, Hereford steer of great depth and thickness carrying a great amount of flesh on a magnificent back and loin.

SHORTHORNS were exhibited by Messrs. J. R. Coates & Son and J. McCully Pipes, Nappan, N. S.; Harold and Hazen Etter, Westmorland Point, N. B.; E. P. Anderson, Sackville, N. B.; Edwin and Chas. W. Forrest, Amherst Point, N. S.; Geo. M. and Fred T. Holmes, Amherst, N. S.; J. E. Baker & Son, Barronsfield, N. S.; C. A. Archibald, Truro, N. S. and R. A. Snowball, Chatham, N. B.

The winner of the female championship and sweepstakes for best animal any age in this class was Lady Ruler, by Royal Ruler a Guardhouse bred bull. Lady Ruler captured the M. J. O'Brien Cup which was won n 1909 and 1910 by C. A. Archibald. For the first time in the history of the Cup it has been won by a New Brunswick exhibitor. Lady Ruler is very evenly fleshed, possessing a well filled wide loin and great depth but a trifle weak back of the shoulder. The best steer was shown by J. R. Coates & Son.

The reserve champion in the Shorthorn class was a Snowball calf which was brought out in exceptionally good shape, and which also won the Blatchford Calf Meal Special prize. The Snowball herd was out in excellent condition and reflected great credit on their owner as well as on the efficient herdsman, Mr. John Bennett and his assistant, Mr. Don Mc Intyre.

C. A. Archibald had some magnificent cows and heifers, his winnings will be found in the list of awards.

GRADES—The Grade classes were a good uniform lot. The Pugsley Cup, won for the third time in 1910 by W. W. Black was put back in competition by Mr. Black under conditions as formerly viz: Championship in the Grade Beef class. This cup was won by Mr. E. T. Anderson, Sackville, N. B. with a senior calf steer that gives evidence of developing into an ideal beef animal of excellent smoothness.

The Dressed Beef Carcásses were seven in number. The first prize going to Edwin Forrest on the first prize two-year-old Shorthorn grade steer. The second prize carcass was that of the first prize three-year-old Hereford grade steer. C. W. Forrest's second prize two-year-old Shorthorn grade cow and his second prize, two year old Grade heifer, dressed out as third and fourth prize carcasses respectively. The fifth prize carcass was from Harold Etter's fourth prize two-year-old grade Hereford steer while the sixth prize went to J. R. Coates on his first prize two-year-old pure-bred Shorthorn steer.

The younger exhibitors were out to win and had their stock in better shape than ever before.

THE DAIRY TEST.

On another page of this issue will be found in tabulated form a full report of the achievements in the dairy test. This department of the Fair, as an educational feature, is rapidly gaining prominence. There were 86 matronly cows on hand to show what they could do. Last year's test included 72 cows. The highest score made last year was 149 points, made by a grade Holstein cow owned by T. W. Keillor, Amherst Point, N. S. The highest score this year was 157.54

The T. Eaton prize for the best herd went to A. McRae & Sons, Charlottetown as the highest scoring herd, Dickie's, had won an Eaton prize on a previous occasion.

The Holstein-Frieeian Association's prize for the highest scoring three-year-old cow in the test as well as the Henry Birkes & Sons' Cup went toS. Dickie & Son. Fowler Bros., Amherst Point, N. S. had the champion cow in the Grade class and won the Holstein-Friesian Association's Cup.

RULES GOVERNING DAIRY TEST.

56. All cows shown in pure-bred classes must be recorded in Canadian Maritime or reputable English or American records, and certificates produced. The name of the breeder and the age and record number of the animal must be given at the time of making entry. In the case of grades a statement giving the number and kind of crosses; and if from a pure-breed sire, the name and number of the sire must be given at the time of making entry.

58. The cows in the test shall be milked dry in the presence of the judges at 1 p. m., December 3rd, and the test will conclude at 1 p. m. on December 5th. The percentage of fat in the milk will be determined by the Babcock milk tester and the percentage of solids not fat will be determined by ascertaining the specific gravity of the milk and then estimating the amount of solids not fat, by the use of the authorized formula for the purpose.

59. Cows entered in this test must be in the building not later than Saturday evening December 2nd.

60. The standing of the respective cows will be computed on the following scale: 25points for each pound of fat; 3 points for each pound of solids, not fat; 1 point for each ten days in milk after the first 30 days. Limits ten points.

61. No cow four years old or over, shall win first prize that does not produce at the rate of 10 pounds of butter per week, or a 2nd or any other prize that does not produce at the rate of 8 pounds of butter per week. No three year old cow shall win a first prize that does not produce at the rate of 9 pounds of butter per week, or a second or any other prize that does not produce at the rate of 8 pounds of butter per week, No heifer two years shall win a 1st prize that does not produce at the rate of 8 pounds ol butter per week, or a second or any other prize that does not produce at the rate of 6 pounds of butter per week. No heifer one year old shall win first prize that does not produce at the rate of 7 pounds of butter per week, or a second or any other prize that does not produce at the rate of 5 pounds of butter per week.

62. An affidavit may be required from each exhibitorin the Dairy Test stating the number of days his exhibits have been in milk; also stating that each cow is shown in her proper class and that she is the animal named on the registration certificate produced.

SHEEP.

The Sheep exhibit was a hummer, as a large exhibit of grand quality was out. Many of the individuals shown would do well at the larger fat stock exhibitions, so good was the quality and the fit in which the shepherds or owners brought them out. Best of all to enjoy was the enthusiasm with which the various exhibitors entered the fray.

Leicesters, as usual, in these provinces, were strong leaders in the long wool class, the exhibitors being: Messrs. Albert Boswall, Pownal, P. E. I.; Retson Bros., Truro, N. S.; Samuel C. Lane, Pownal and Jas. A. Telfer, Sussex, N. B. The fight lay between Messrs. Retson Bros. and Albert Boswall. Telfer having only one entry.

The lordly Lincolns were out in full force and some beauties there were. Here the prizes were very evenly di. vided amongst the exhibitors, who were: Messrs. Jas. A. Telfer, Albert Boswall, Jr., French Fort, P. E. I. and a new exhibitor, Mr. C. W. Pugsley, Barronsfield, N. S.

Cotswolds were few in numbers. Mr. Telfer having sold his prize winners previous to the Fair. Retson Bros., Truro, N. S. contested against Mr. Telfer for the honors of the class while in the fat section Mr. Albert Boswall, Jr. held the winner.

The Cheviot, that bright and active mutton sheep, had an ardent champion in Mr. Chas. Symes, Minudie, N. S. There is room for more of these sturdy mountain sheep on the hills of the Maritime Provinces.

Horned Dorsets were a strong class. Some excellent specimens shown, being brought out in great form by their owners, Messrs. Geo. L. Boswall, French Fort, P. E. I.; Hartland Poultry Yards and Jas. A. Telfer.

Southdowns, that little big sheep, from which we get the best mutton chops, etc., were well brought out by their respective exhibitors, Messrs. J. E. Baker & Sons, Barronsfield, N. S.; Cephas Nunn, Winsloe Road, P. E. I. and Oliver C. Saunders, Trilby, P. E. I.

Shropshires, the nobby rent payers were, as usual, out in full force and some splendid specimens of the breed were amongst the number. Our veteran feeder, Mr. Jas. J. Stewart, Amherst Point, N. S. was there with a broad smile upon his face as he led his pets into the ring and with Cephas Nunn, Geo. L. Boswall and Jas. A. Telfer there was a good honorable fight.

In Hampshires, Mr. Telfer led in the fray with Cephas Nunn a close second.

In the Oxford classes, the gallant shepherds, The Baker Boys did battle with Mr. Robert Kidney, the untiring and ever pleasant shepherd of the Hartland Poultry Yards.

Suffolks, the great English mutton breed, were exhibited by Mr. Albert Boswall, Jr.

FLEECE JUDGING.

One of the newer features in the sheep classes was a fleece competition. The various exhibitors and their friends donated a handsome purse which was divided in first, second and third prizes, in each class ol the sheep department. The judging was done by W. A. Rich, wool expert of the Department of Agriculture, Ottawa, and C. M. McRae. This was a competition in which the sheep men took an active interest and from which they derived much valuable instruction on judging wool.

SWINE.

The Yorkshire, Tamworth, Berkshire and Grade Swine classes had strong competitions in every section. In the Chester White class Leonard Court and Thos. J. Etter had everything their own way with a nice, smooth bunch of porkers.

J. W. Callbeck, Summerside, P. E. I. Roper Bros., Charlottetown; A. A. McBeath, Marshfield and W. C. Black Salem, N. S., championed the Yorkshire breed, Messrs. Callbeck and McBeath leading the way witb deep sided, smooth shouldered, even backed specimens.

The Tamworths were also a good lot and were exhibited by the veteran exhibitors from Prince Edward Island, Messrs. W. J. Gibson and Roper Bros. Most of the plums in the class going to the Gibson herd.

There were six exhibitors of the trim and ever popular Berkshires. Peter Brodie, A. A. McBeath and W. J. Gibson were over from Prince Edward Island to vie with Messrs. Logan Bros., Fowler Bros. and Jas. J. Stewart of Amherst Point, N. S. Their respective winnings will be found on another page of this issue.

W. J. Gibson had the Grand Champion individual and won the Atlas Stock Food Co's. Silver Cup.

The Percy B. Evans Silver Cup for the Grand Champion Pen was captured by A. A. McBeath.

With the exception of 10th prize all the prizes in the Dressed Carcass competition went to Island exhibitors; J. W. Callbeck's Yorks in first place closely followed in second place by Brodie's Berks.

LIVE STOCK JUDGING COMPETITION.

This feature has been growing in prominence, from year to year. In every respect the competition of 1911 was most satisfactory. Thirty-five young men, under twenty-five years of age competed in the judging of Dairy and Beef Cattle and Sheep. Two classes each of these sections were selected by the judges of these departments, D. Drummond, W. R. Rlliott and C. M. McRae. Possible score per section 200 points.

The prizes in the Dairy Class were contributed by Messrs. R. S. Carter, M. P. P. and J. L. Ralston, M. P. P. The Beef prizes were contributed by the Amherst Boot and Shoe Co. and Stanfields, Limited, Truro contributed the Sheep judging prizes.

Following are the results:—

SHEEP—1st, O. Schafheitlin; 2nd, J. G. Archibald; 3rd, H. Secord; 4th, A. Tattrie; 5th, Jas. Easton.

BEEF—1st, Jas. Easton; 2nd, G. Hubbard; 3rd, M. A. Steward; 4th, W. M. Chisholm; 5th, Jas. Campbell.

DAIRY—1st, Jas. Easton; 2nd, H. P. Munro; 3rd, W. Smythe; 4th, H. Grimmer; 5th, E. Boulden.

Prof. Cumming's Silver Cup for the person making the highest score in the above classes was won by Mr. W. M. Chisholm, a second year student at the N. S. A. C.

The M. S. B. A. Cup for the person, not a regular student of the Agricultural College making the highest score, was won by Mr. Jas. Easton, who has had long experience in competitions and who, we are pleased to say, won a Cup in 1910.

The possible score for the above cups was 600.

Following are the scores made by the five highest contestants, Jas. J. Easton, 483; W. M. Chisholm, 405; D. Moore, 403; V. Durling, 387; E. Moreash, 385.

The educational value of the contest is readily estimated by the keen interest shown in it by the spectators. All young farmers should prepare themselves for such competitions as through them they gain, not only confidence in their own judg-

POULTRY.

The Poultry show was the largest in the history of any show ever coop-ed in the Maritime Provinces.

In a few cases the quality was a little disapointing but nevertheless there was an abundance of good birds. Not a few good birds were turned down on account of careless preparation and neglect on the part of the exhibitor. The lessons taught in this way will, no doubt, react to the credit of future shows. A good judge likes to see the birds brought out in the pink of condition and it galls him to have to pass over a good bird that would be placed at the top of the list if properly exhibited.

The Asiatic varieties were out in larger numbers than ever before. This was particularly noticeable in the Black Langshans, Buff Cochin and Light Brahma classes.

Dorkings, the favorite English breed, were better represented than on any previous occasion.

Barred Plymouth Rocks made a splendid display, although not so numerous as we have seen them at Amherst, yet the quality was away up. Craig Bros. were the heavy winners in this class, capturing the 1st and 2nd cock prizes; 1st and 6th on hens; 2nd, 3rd, 4th and 6th on cockerels; 2nd and 6th on pullets as well as first on a pullet mating breeding pen and 2nd on a cockerel mating pen in the open classes and 1st and 3rd pens, 1st and 3rd pairs of pullets and 3rd pair of cockerels in the utility class. The first cock, hen and cockerel were worthy of special mention. L. H. D. Foster, Glenview Poultry Yards and Watson Lutz were strong exhibitors in this class, Mr. Foster capturing first prizes on cockerel and pullet as well as some other prizes.

There was a big class of White Rocks, some of which would look better had they been introduced to the wash-tub.

Some excellent Buff Rocks were shown.

Wyandottes, particularly the Silvers were more numerous than on previous occasions. Buffs were few in numbers. Whites were only about half as numerous as last year but some good ones showed up. For the first time in several years the first prizes in all four sections of the class were won by one exhibitor, Mr. A. C. Reid. Columbians made a good showing in numbers and in quality.

Minorcas came out in great numbers, in fact they were one of the largest classes in the show and they had quality to burn. The first cock, hen, cockerel and pullet were almost ideal.

White Leghorns were not as strong a class as we have seen at the Maritime Winter Fair.

Brown Leghorns were the largest class in the show and the quality was excellent. The first cock, hen, cockerel and pullet were fit for any company.

The Buff Leghorns were very nice.

Games were fair.

Hamburgs a good class.

The Buff Orpingtons were a classy lot and fit to show at Boston or one of the larger shows.

The White Orpingtons showed up well but a few cock birds were disqualified.

Rhode Island Reds were a big class of fairly good quality.

Turkeys, Geese and Ducks were out in large numbers and the best quality in the history of the show. No better class of Bronze Turkeys ever came together in one show in Eastern Canada.

The Dressed Poultry Room presented a fine showing. The improvement since last year was very noticeable but some cases of bad bleeding caused the turning down of otherwise good stock.

J. P. Landry the popular poultry Superintendent at the N. S. A. C. superintended the show and it is needless to say that he did his work to the satisfaction of all concerned and in his usual prompt and obliging style.

ment, but also the educational value. The N. S. A. C. is the best place for such preparation as may be seen from the above results, where 76 per cent. of the prizes and one Silver Cup goes to College trained but otherwise inexperienced men.

FRUIT.

The fruit department contained some plates of excellent specimens of apples from the New Brunswick Counties of Albert, Queens, Charlotte, St. John, Sunbury, Kings and Victoria. The Nova Scotia Counties of Cumberland, Antigonish, Colchester, Queens, Pictou, Kings, Hants and Annapolis were also well represented as were Kings, Queens and Prince the three Prince Edward Island Counties.

The banner collection was shown by Hants County, N. S. The color and selection throughout the whole exhibit was extremely good and we were pleased to note that even the poorest collection was quite presentable. The New Brunswick exhibit consisted of 15 collections while Nova Scotia had 21 collections and Prince Edward Island 6 collections.

The Nova Scotia Agricultural College had a booth at the Fair presided over by Prof. Landells who was ready to talk drainage question with any person interested in that subject. He had working models and simple instruments used for laying out drains as well as samples of Tile. By the number of visitors who congregated around Prof. Landell's booth we would judge that the drainage question is a live one with our Maritime Province farmers.

APAIARY PRODUCTS.

There was a fair display of Apaiary products, but not as extensive as it might be owing to last summer being a poor honey season.

THE SEED FAIR.

Held in connection with the Stock Show had several new features of especial interest to those interested in seed improvement viz:

Exhibits from the first prize winners in the Nova Scotia and New Brunswick Field Crops competition and an exhibit of Seed Corn, the first ever exhibited at the Winter Fair. The total number of entries were about the same as last year. In the threshed grain exhibit the entries were fewer in numbers but the grain exhibits were the largest in the history of the Fair. Allowing for the extreme heat of the past season the quality was very satisfactory indeed and showed that improvements are belng made from year to year. The main factors causing this improvement is the almost unusual treatment for smuts, and the system of hand selection practiced by the exhibitors. There is a lesson in this for every farmer even if he never intends to exhibit grain.

Mr. Robert McKay, Millville, N. S. the winner of the Steele Briggs Cup, open to members of the Canadian Seed Growers' Association, in 1910, was again successful in capturing the trophy this year. Mr. McKay's exhibit was of a very high character, indeed, and deserves all due credit for his success.

The Wm. Ewing Cup went to the Garden of the Gulf, being carried thither by Mr. Ernest Bulman, one of the prominent seed grain growers of Rusticoville, P. E. I.

It was pleasing to note the interest farmers displayed in all matters pertaining to the improvement of seed for general use. It is a most hopeful sign of future crop improvement in Maritime Canada. There is not a shadow of a doubt, in the minds of anyone, that this interest has been largely stimulated by the efforts of the C. S. G. A.

THE CONVENTIONS.

The Seed Growers' Association, The Poultry Association, The Beekeepers' Association, The Guernsey Association and the newly organized Sheep Breeders' held very profitable annual meetings during the Fair season to which we will refer later.

ON TUESDAY EVENING.

Vice President C. A. Archibald occupied the chair in the Auditorium while Prof. M. Cumming gave an interesting address on "What the Season of 1911 has Taught Us regarding Conservation." L. H. Newman, Secretary, Canadian Seed Growers' Association spoke on the subject of "Some Lessons from Scandanavian Agriculture and Messrs. C. M. McRae and W. A. Rich delivered addresses on "The Sheep Industry in the Maritime Provinces and on Wool."

ON WEDNESDAY EVENING.

The following programme was carried out:

Address by F. C. Nunmick, Agriculturist of Commission on Conservation; address by D. Drummond, Ottawa, on "Improvement of Dairy Herds"; address by W. R. Elliott, Galt, Ont., on "Beef Production"; address, John Guardhouse, Highfield, Ont., on "Production of Mutton."

ON THURSDAY EVEEING

the presentation of special prizes was ably made by Mr. W. W. Hubbard. One of the pleasing features was the presentation to Mr. Percie Johnson, St. Johns' Newfoundland of a pen of magnificent Minorcas, a gift from the poultry men in recognition of Mr. Johnson's interest in awarding a handsome Silver Cup in the poultry classes of the Fair.

Jas. A. Telfer.

Secretary-Treasurer Maritime Sheep Breeders' Association.

Maritime Sheep Men are up and doing. Realizing that in union there is strength and encouraged by Mr. W. A. Rich, the wool expert of the Federal Department for Agriculture, the shepherds and other interested sheep men, who were present at the Winter Fair, banded together and formed themselves into a Maritime Sheep Breeders' Association. The annual membership fee is $1.00 and the officers for the ensuing year are:

President—S. A. Logan, Amherst Point, N. S.; Vice-President—Albert Boswall, Jr., French Fort, P. E. I.; Directors—D. Innis, Tobique River, N. B.; T. B. Calhoun, Calhoun's, N. B.; Barry W. Baker, Barronsfield, N. S.; E. J. Johnson, George's River, N. S.; Oliver C. Saunders, Trilby, P. E. I.; Frank Glydon, Margate, P. E. I.; Secretary-Treasurer—J. A. Telfer, Markhamville, N. S.; Constitution Committee—The Officers of the Association, Col. H. Montgomery-Campbell and W. W. Hubbard.

Results of the 48 Hours Dairy Test at the 1911 Winter Fair, Amherst, N.S.

Editor's Note:—There is food for thought in the above records. Note the difference in milk yield, butter fat, solids not fat and total score of the various cows. Every dairyman should be conversant with the production of each and every cow in his herd. Section 1 contains cows four years old or over, section 2, cows 3 years old, section 3, heifers two years old and section 4 heifers 1 year old.

Feeding and Developing a Dairy Herd.

A Successful Dairyman's Methods.

By W. R. Clarke, North Wiltshire, P. E. I.

Editor The Maritime Farmer:

In compliance with your request I am sending you the following notes re: The methods we have adopted in the upbuilding of our dairy herd:

Many years ago, when the live stock industry and dairy interests were still in their infancy, a large majority of farmers depended on the raw products of their farms for the wherewhithal on which to live.

When the movement of keeping live stock and feeding to them the raw products and selling the finished article and returning most of the fertility to the soil, was advocated the older member of our firm saw the reasoning back of this idea and at once took steps toward that end.

Being naturally inclined more to dairying than to beef raising he decided to follow his inclinations. As he was located too far from a town to retail milk, he was through force of circumstances obliged to engage in the home manufacture of dairy prints. Time has proven that branch of the dairy industry can be made a profitable one, providing one manufactures a grade of butter that will make and keep a market for itself. As this was prior to the days of co-operative dairying, a market for the finished product was sought and found in the nearest town.

Of course pigs had to be kept to take care of the skim milk and turn it into prime bacon.

Since it was butter and lots of it that was wished for, his choice of a breed of cows fell on the Jerseys. After a long experience with this breed we find no reason to regret his choice but we do find many reasons to be pleased with the selection. Were we to start over again and be obliged to choose a breed of cows for milk, butter or cheese production our choice would be the same rent-paying breed from the Channel Isles.

We have always found that quality comes before quantity in the dairy business.

The foundation of our herd was not laid by the large purchase of expensive stock. A pure bred bull was the first purchase and in this way scrub cows were followed in succession by grade and high grade Jerseys until further advancement was made by the purchase at various times of pure bred cows, two or three being all that we ever purchased. By the continued use of pure bred sires and the selection of the best female progeny we have been successful in establishing a first-class herd at small expense, and which, from the very beginning has always paid a handsome yearly profit.

We consider this is the best plan for any farmer wishing to enter the pure bred stock business to follow. The purchase of a large number of expensive animals for a herd foundation is almost invariably followed by disappointment and loss. We would advise our fellow dairymen to put their faith and money in the best pure bred sires they can buy, and be content with a moderate investment in females. Everybody is familiar with the saying: "The bull is half the herd," and every breeder knows this to be a truism.

We have always made it our constant aim in our breeding operations, to increase the feed consuming capacity of our cows. That we have met with a fair measure of success is evidenced by the fact that we are told by competent and widely experienced judges, that our Jerseys are the largest they have met. But while we have increased the size we have not lost the high testing qualities of our cows. We believe the most short-sighted and serious mistake a breeder can make is that of breeding the heifers too young, as what will be gained by an extra year in milk is completely offset by the lack of development and the consequent decreased future capacity of the cow. The heifers must be given a chance to develop so that they may have strength to withstand the great strain put upon them when they come into milk. Increased capacity and an increased number of years of usefulness is the result of such a policy. We aim to have our heifers drop their first calves when they are from two and one-half to three years old. Up to that time we give them ordinary good care, feeding a meal ration for several months before calving, making them almost fit for the butcher's block at calving time. The meal ration is discontinued about two weeks before and until, at least, a week after calving, to avoid udder trouble. After that, if the heifer is doing nicely, we resume to feed the meal ration, gradually increasing the quantity until she is taking all she will eat up clean.

We believe all heifers should be forced to their full capacity, with a fair margin of safety, during their first milking period. They thus acquire the habit of giving a good flow of milk that is if they use the food for that purpose. Should they use the food for the purpose of laying on flesh and fat where the butcher wants it, that personage will, no doubt, be glad to handle them and nothing will be lost either way—the herd will have an increase in aberage quality if not in quantity, and as already stated, "quality before quantity" should be every dairyman's aim.

We make the first milking period a long one, milking to within a month at most, of calving. This system teaches them to be persistent milkers, and, as the breed we are handling are naturally persistent milkers we sometimes find it rather difficult to get some cows dry at all. We generally allow them a dry period of about a month. Heifers treated in this manner will become large, strong, heavy feeding, heavy producing mature cows, capable of standing the heavy strain of extended milking periods.

So much for our breeding, selecting and developing practices. We must now take up the feeding end of the business, which is of even more importance than the former.

We do not belong to that class of darymen who use all their available land to grow roughage and provide pasturage for their herd and then buy all their concentrates in the shape of bean, shorts, oilcake, cotton seed, meals, etc. While we grow all the roughage our herd consumes, we grow also the largest part of the meal ration in the shape of grains, the principal one being oats, of which we have a couple of thousand bushels each year, all of which is consumed on the farm. Therefore, $125.00 to $150.00 will easily cover the cost of all the meals we buy in the course of a year.

We believe that this is a more profitable plan, when possible, than to keep such a number of cows as to take all the farm to grow roughage and provide pasture for them and buy all the meal required. It is certainly so when the price of meals is as high as it has been in recent years. Crushed oats form the largest part of the meal ration with us, supplemented with bran, oilcake or cotton seed. We are feeding very little bran this winter as its price has gone away beyond its feeding value. We consider cotton seed meal better value at present prices. Oilcake is a splendid feed but it also has gone beyond its value. Having always plenty of crushed oats, which is a great milk producer, we do not feel the effects of the high price of concentrates as we otherwise might.

For dry roughage we have clover and timothy hay, generally having enough clover to put the herd through. Once in every four or five years, generally speaking, the clover gets completely killed and we have to depend on timothy alone. In that case, we have to increase the meal ration. We also allow them to pick over all the oat straw, which is afterwards used for bedding. For succulent feed we depend mostly on turnips and mangels. The latter keep longer and are reserved for the last month in the spring after the turnips are gone.

We consider that turnips are better milk producers than mangels and turnip tops hauled from the field, while they last, are better than either. This may seem strange to most farmers but it is, nevertheless, a fact. We have heard other dairymen say that turnip tops increase the flow of milk and it bears out our own experience. Turnips and turnip tops must be fed immediately after milking to avoid flavoring the milk.

For soiling crops, we provide peas, oats and vetches, sown at intervals, and fodder corn. We commence feeding the green feed about the first of August. When this is finished we follow it with the fodder corn, of which we have enough to last for a month. It is fed from the stook besides what we feed as we cut. We do not favor corn for ensilage as our fall weather is generally too severe on this crop and if cut early is not matured enough to make good silage.

We would advise every dairyman, handling pure bred stock to enter some of his cows in the Canadian Record of Performance test. Nothing will make a dairyman a good feeder quicker than to be feeding a cow in a test of this kind. As he watches the milk sheet he finds that every extra pound of feed increases the milk flow and he acts accordingly.

But it is only going half way to weigh only the milk. Means must be taken so that a pretty close estimate of the feed consumed can be made. A large cow, with great capacity for feed, may consume enormous quantities of feed and give a large flow of milk, and still make a smaller profit than a smaller cow that consumes less feed and gives less milk but makes a more profitable use of her feed.

While we have had a fair measure of success in our breeding and feeding, we have still a long distance to travel before we will have reached that perfection which should be the aim of every breeder, although he may never reach it. We each must be satisfied to add our small quota to the march of progress towards better cows and more profitable dairying.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

A CALL TO THE COLLEGE SHORT COURSE.

On another page of this issue will be found a call to the 1912 short courses at the Nova Scotia Agricultural College. The courses will open on January 2nd. Men, women, boys and girls from Nova Scotia, New Brunswick and Prince Edward Island are cordially invited to attend. The course for farmers and farmers' sons will embrace all the features in connection with Soil Cultivation, Live Stock, Horticulture, Dairying, Poultry, and Veterinary Science that have made the previous courses so valuable and popular. In addition, instruction in the running of gasoline engines will be added, for which purpose the various manufacturers will have their machines on exhibition. Particular attention will be given to power sprayers.

The short course for ladies, held on the same dates, promises to be the most largely attended yet. The subjects taught will be Dairying, Horticulture, Poultry, Domestic Science, and students may attend selective classes from the above course.

Tuition to students from all the Maritime Provinces free. All railways grant "single fare" privilege. Board will cost from $3.50 to $4.00 per week. The courses will be in session from January 2nd to January 12th. Knowing these facts all persons who propose attending the college may figure the cost before they leave home.

The cost is trifling compared with the value of the benefits you will receive in the form of instruction and a broader view of your profession through coming in contact with so many of your colaborers in agriculture, the peer of all professions. These benefits will go with you to the end of life. In years to come we feel safe in saying, you will look back, through the years, to the ten days, shall we say you "spent," no! that you "used to improve your opportunities" by attending the short courses at the Nova Scotia Agricultural College, as one of the brightest spots in your memory.

The benefits that have already come to the farmers of the Maritime Provinces through the ideals set forth by the Nova Scotia College of Agriculture can never be estimated in dollars and cents. Its uplifting influences are seen and felt on every hand.

To know the various members of the college staff is to respect them for all time to come. Each and every one of them are friends to the farmers and are ever ready to do anything in their power to help the farmers' best interests on to fruition.

CO-OPERATIVE STORES.

The following is taken from an interesting article in a recent issue of the "Toronto Saturday Night." The article was illustrated by a cut of James Mitchell, Stellarton, whom it designates The Father of the co-operative movement in Canada.

The oldest form of co-operation in the Dominion of Canada is retail store-keeping, which is older than Confederation. The home of co-operation in Canada is found among the miners in Nova Scotia, who brought the seed over from Great Britain. The oldest co-operative store in Canada to-day is situated at Stellerton in the county of Pictou on the mainland, where it was set up nearly half a century ago; but most of the early ventures were in Cape Breton. These workers in iron and coal have had many failures, but they have never lost heart; and to-day there are more co-operative stores in the little island mining camp than in any other entire province in the Dominion.

The Stellarton store, the oldest in Canada, so far as I have been able to learn, bears the name of "The Union Association, Limited." As its letter-heads announce, it deals in dry goods and groceries, meal, boots and shoes, hardware, etc." It commenced business on October 1, 1861; and the present manager, Mr. James Mitchell, was then appointed secretary. At the opening there were about 30 members and a capital of about $1,000. On March 1, 1910, the latest returns available, there were 214 members; the capital had grown to $16,283; and a yearly business of $60,000 was done, of which $45,225 was with members. Interest at six per cent. is paid on capital stock, and the rest of the profits are divided among the shareholders according to their purchases. The rate of the dividend on purchases had fluctuated a good deal. Mr. Mitchell became manager in 1876. The first year of his management the rate was 6 per cent., but the next year it fell back to 3 per cent. From that point the growth had been steady till the last half dozen years. For seven years about the end of the last century the dividend rate was 12 per cent., but last year was only 10 per cent. The business of the store is now triple what it was when Mr. Mitchell became manager thirty-five years ago.

The oldest co-operative store in Cape Breton—and the second oldest co-operative store in the Dominion—is the "Sydney Mines Provident Society, Limited.' It was started in 1863, and continued in operation till 1905. This store was brought down by a series of misfortunes. Its first and basic weakness was that it neglected a generally recognized principle of co-operation and kept no reserve. Consequently when it got into troublous times, it had no untouched resources to draw upon. And the troubles came inevitably. A mining population is a floating population. The miners began to move away and to take their capital with them. The conditions of trade began to change, and the management did not keep pace with the alterations in demand. Finally the store was destroyed by fire, and the society never recovered. But even then, it had lived and done business for forty-two years.

There are still a half dozen of these stores at work among the Cape Breton miners. One of the most successful is the Workmen's Co-operative Store Company, Limited, at Dominion. It was organized nine years ago with thirty-six members, and in 1909 its membership—that is, the number of its shareholders—was ono hundred and ninety-three. During the half year ending August 22 last, its sales were valued at $40,000, an increase for the half year of $1,583. During the same period its profits were $4,563, of which ten per cent. or $456, was placed in the reserve fund—a feature now of all Cape Breton societies—and that fund totalled $4,187. The regular rate of interest—six per cent—was paid on capital; and dividend of ten per cent. was paid on purchases. The total capital paid into the company in its eight years career is given as $14.019. On this interest has been paid in dividends on purchases and $4,187 set aside as reserve. Thus the total profits earned by the society in eight years have been $40,908.

NEED OF INDUSTRIAL TRAINING.

Seventy-five of the high school girls in the city of Roswell, New Mexico, petitioned the superintendent of city schools asking that they be excused from taking domestic science. They stated, in effect, that they believe dishwashing to be degrading and not conducive to mentality; that they are not accustomed to such work at home and that they do not care to learn the art of cooking.

That these girls do not "do such work at home" is perhaps unfortunate and it is all the more important that they learn how to do common every day-work at school, since they have never been taught at home. That "dishwashing" or any other work in maintaining the home and making life pleasant for their parents should be regarded as degrading is perhaps not their fault, since they have never been taught the dignity of labor and the opportunities for happiness in keeping the home in order. It shows how the training of our girls is being neglected in the home and explains the urgent need of industrial training in our public schools such as is given in the Roswell city schools.

Whether these girls are fortunate (?) enough to have servants to do the degrading (?) work that they consider antagonistic to mentality when they are responsible for a home, or whether they must do the work themselves, they are apt to regret their aversion to the course in domestic science. They do not know the advantages this knowledge gives in meeting the trials and vicissitudes of life; they do not realize the trials, cares and responsibilities of those who must make or wreck a home.

To make our schools efficient in qualifying boys and girls for the responsibilities of every-day life, teachers must have the cooperation of parents. Children are not capable of deciding what they should study and how they should be trained and when parents repudiate the teacher because the course of study does not conform to the child's idea of "mentality," our social, economic and moral institutions will be weakened.

No man ever raised himself by tearing down his fellow man. Get up yourself and lift up your fellow man with you.

What Students Say About the N. S. A. C.

T. H. Manzer, Aroostook Junction, Victoria Co., writes:As to my opinion of the course, I was much pleased with it, and I only regretted that more from these upper counties were not present to take advantage of it. I think the majority of farmers here are making a mistake selling so much low-priced material off the farm. Personally, I have got quite largely into potatoes, which are a very risky crop. I think the greatest difficulty farmers have to contend with is the scarcity and high price of labor. I have never tried foreign labor, as I consider they would not understand our conditions, and would not suit me, as I only need one permanent man. I have dropped dairying since the factory failed in Andover, as it is impossible to get indoor help. Many have gone into potatoes and are buying large quantities of expensive commercial fertilizers, which this year will take the whole crop (and in many cases more) to pay for it. It might be a help if we could get a factory started on the cream gathering system, as was done in Woodstock the past season.

It would be a good thing if you could send Mr. Moore through the country districts here on the seed question, and it is a question which every farmer here is interested in. We received instructions at Truro which proved the great advantage of grading up and using the very best seed. This year I intend planting only large potatoes of good shape. If Mr. Moore could come in March or early in April, I would be glad to accompany him to some of the meetings.

William McDougall, East Glassville, Carleton Co., writes:In regard to the college at Truro, N. S., I think that it is a great help to the young men who attend it, as it gives a course of instruction that he cannot get at home, and he also can get practical information there that he can make use of on his farm. I think that farming would pay better if the farmers would adopt more modern ideas and get out of the old rut. The difficulties that the farmers have to contend with are the cost of transportation and the charges of the "middlemen," as well as the scarcity of farm help at certain seasons of the year. If more settlers could be induced to settle on the vacant farms that are in Aberdeen it would help the situation.

Rev. J. S. Gregg, Young's Cove, Queen's Co., writes:I was able to spend one week at Truro. I enjoyed the classes very much. Already I believe an interest has been awakened in agricultural interests in my parish. I enclose bills for railway fares. I will not ask for more. I wish to stand on same ground with any farmer. I am well satisfied that these short courses are better than anything yet undertaken for young farmers. I am sending a letter to-day to Wesleyan Church Paper, Halifax, N. S.

Mr. Moore, inspector of seeds for Maritime Provinces, hopes to give us here two days in March at farmers' meetings. I hope his duties will permit of this.

Clarence Robinson, East Glassville, Carleton co., writes: In regard to the college at Truro, I think that it gives a good course of instruction for the young men and older ones too who intend to farm, as we get practical information there that we cannot get at home. You ask what the principal difficulties are the farmers have to contend with. I would say that the cost of transportation to markets and the high rates of the C. P. R. The latter, we hope, will soon be reduced, as the G. T. P. will soon be hauling freight through the eastern part of Aberdeen parish.

Why not Profit as they have Profited?

Extracts from the New Brunswick 1910 Report on Agriculture.

W. M. Starkey, Starkey's, Queen's Co., writes: I took in all of the courses and thought they were all right. I think that every farmer should have a little of every kind of stock and raise a lot of turnips, grain and potatoes. Corn, I think, is a splendid thing. I have a silo built and have been growing it two years, and find it a great saving on hay, and also it seems to be good for all kinds of stock. The principal thing I see about farming is that our land is lacking of humus, and I think we will have to get growing clover and plough it under to try and build up the soil. I also think we should grow more green stuffs for our cows to feed on after grass gets short. We should keep more pigs, and haul in lots of black mud or marsh mud, and all of the rough stuff we can find. If some people have got this stuff, they could go to the woods and gather leaves; they are a splendid thing. We have got to get to work at something soon, or else get out or starve, and stop buying so much feed from the West.

Henry Kirtley, Welsford, Queen's Co., writes: In regard to the instructions I received while attending the Short Course, I may say that I spent a very profitable time, and I received valuable information in regard to farming in general; and I feel amply repaid for my trip. As to what are my intentions for the future, I may say that dairying is my first aim, and raising as much pork as I can profitably handle. In regard to the principal difficulties farmers have to contend with, I think a great deal rests with the farmer himself. If farmers would give a little more careful study to their work, carry on a more systematic rotation on their land, more intensive cultivation, and keep only the best animals that can be had to suit his needs, I do not see what is to prevent a farmer from getting a comfortable living.

J. H. McCrea, Shannon, Queen's Co., writes: Regarding the course I attended, I must speak very much in favor of it. It is a grand institution. I am very sorry New Brunswick has not a similar school to educate the farmers. While I must commend the government for the steps they are taking to encourage farming, I think we should have just such a school in N. B. I think a greater interest would be taken. Of the 40, some long course students, I learned only one was from New Brunswick. I think that is a very small per cent. You spoke of the difficulties we N. B. farmers have to contend with. I can only speak for myself. That is the production of a sufficient quantity of hay on high-land farms. I would not consider it any trouble to farm if I could have one head of cattle for every two acres of land I possess; that is what they told us was necessary at the N. S. A. C. This difficulty can be overcome to a certain extent, I think, by the growing of roots in large quantities, or corn if it could reach a state of maturity.

Harry C. Cochrane, Bloomfield Station, King's Co., writes: You asked for my opinion of the course, and what I thought was the chief difficulty of farming here. Well, I liked the course fine. I think it is just the thing for the farmers of the Maritime Provinces, but I don't think it is advertised nearly enough. I think it ought to be advertised in the daily papers a while before it opens. The majority of farmers know nothing about it. As to the chief difficulty of farming here, I cannot answer, but think one of the main reasons is that the majority of the farmers do not know enough about scientific farming.

G. F. Flewelling, Perry's Point, King's Co., writes: I am rather young in the business of farming to say much of farming and its difficulties, as I have never really done any of it myself, but it is my intention to take it up. I would like stock raising better than any other branch of farming, and it is the branch of farming that is most needed in the Maritime Provinces in my idea. There is certainly on the average a very poor lot of stock.

As to the difficulties of farming, I think a great deal lies with the farmers themselves. Most of them, instead of trying to help their neighbors or learning something from them are finding fault with everything they do, whether it be good or bad, or whether it be on the farm or in the school, church or other affairs. I think that if the farmers would drop this method and co-operate more, help one another along, either by forming agricultural societies or by two or three helping one another by clubbing together and buying some of the improved machinery, which would not only save labor, but would do the work quicker and better. One man I met while in Truro was getting up courage to go out, as he knew he would be the laughing-stock of his neighborhood when he got home. He said that he had almost to skip out at night to get clear. The people around, he said, thought it an awful thing to go to college to learn how to farm—why anybody could farm. I think the farmer should have as good an education as anybody, especially in bookkeeping, so that he can keep an exact account and tell just where he stands. Ask business men what each branch of their business is doing and which is doing the best, and he can tell you exactly where he stands by looking at his books. Ask a farmer where he stands or what he is doing and he has no idea. This is where the business man gets ahead of him, and I think that great stress should be laid upon the education of the future farmers. Again, the business men work together and know what each other are doing, while the farmers try to keep what they are doing to themselves. Thus it is that business men are so much more wealthy than farmers, as they see what others are doing, and take advantage of improvements that may come out. Until the farmers see their folly and try to change their ways I don't think they will get along as well as they might.

The course at Truro was everything one could look for. It was practical and was carried on so that one could not help receiving a great deal of benefit from it. Every branch of agriculture was taken up in the way that it was thought that we would receive the most benefit. It was certainly a fine course, and I really do feel sorry for those unfortunate enough to miss it.

H. Allen Dickson, Jubilee, King's Co., writes: I consider the course at the Truro College a great benefit for the length of time spent there, and if more farmers would take advantage of it they would find it a great benefit.

I think the principal difficulties our farmers have to contend with are need of a better knowledge of the fertility of the soil, and management of the dairy herd.

W. P. Fowler, Hammond Vale, King's Co., writes: In my opinion the course of instruction at the Truro College would be hard to beat. I know it was of great benefit to me, so much so that it is possible I may take the full course beginning next fall. The time was so short that the instructors could only hit the high places, so to speak. The courtesy and attention which the short course men received at the hands of Prof. Cumming and his staff was boundless. I propose to farm mainly to beef and draught horses. I believe there is more money in dairy cattle if one is in close touch with a cheese factory and creamery. But as I am not so situated, I will have to do the next best thing. I should like to keep sheep, but on account of the number of dogs it is impossible here. Some of my neighbors do, and every year they lose a good percentage of lambs and ewes. I consider weeds, the greater part of which we import from Ontario in our clover and grass seed, to be one of the greatest drawbacks to our New Brunswick farmers. Also, from what I have seen, I believe the majority of our farmers do not know how to care for and feed live stock correctly. I did not before I went to Truro. If the other fellows know, there are mighty few of them practice their knowledge. I should say that these and all other troubles which we farmers have in New Brunswick could be overcome by your Department getting busy and starting a college and farm on similar lines to those at Truro by the N. S. government. I think that the move would be backed by every farmer with brains in the Province.

W. C. Campbell, Salisbury, Westmorland Co., writes: I think the course at Truro is just the thing that we farmers want. It gives a man a chance to see improved methods and get new ideas, and it impresses a man with the importance of more thorough work in all lines of farming. I intend to raise some more turnips, clover and grain feed. The latter to be fed in August and September and improve the dairy herd. The chief difficulties are lack of knowledge and lack of interest, and not taking good care of our stock, especially the cow. I think it would be well to advertise the college at Truro more, for once a man goes there he will take more interest in his work of farming.

Lee Tingley, Moncton, writes: The course of instructions I attended was principally on stock. I got an insight on many points, especially regarding the dairy cow, which is perhaps the most essential part in New Brunswick. I think a few pure bred cows in each district would help farmers to work into a better lot of stock, as we now have mostly a mixed class of cattle of a general purpose type.

WAS TROUBLED WITH HEART DISEASE AND NERVOUSNESS

SEVERAL DOCTORS COULD DO HER NO GOOD. THREE BOXES OF MILBURN'S HEART AND NERVE PILLS COMPLETELY CURED HER.

Miss Mary Lebeau, Edison, Sask., writes:—"I was troubled with heart disease and nervousness for over two years, and was so bad at times I had to sit up at night being unable to breathe, and every little noise would make me shake and shiver. I tried several doctors, but they were unable to do me any good. A neighbor then advised me to try a box of Milburn's Heart and Nerve Pills. As soon as I began to take them I began to feel much better, and by the time I had used the third box I was completely cured. I would advise anybody suffering from heart disease and nervousness to try these pills. They will save quite a bill in doctor's fees."

Milburn's Heart and Nerve Pills cure all heart and nerve troubles by their restorative influence on every organ and tissue of the body.

Price 50 cents per box, or 3 boxes for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

HORTICULTURE.

Selling Apples in English Markets.

The English apple crop this year has been very large, and the quality has been of unusual excellence. This fact, with the larger offering of apples from other sources, has naturally caused a lower range of prices on Canadian apples than was secured last year. However, prices cannot be considered unsatisfactory owing to the large quantities disposed of, and the condition and quality being generally excellent will leave very little shrinkage on net results consequent on defective packages.

CANADIAN APPLES PRAISED.

The fruit brokers and merchants in Liverpool and Manchester are loud in their praises of the improvement of grading Canadian apples. So far this season there is not in evidence the complaint of many years past, i.e.:—Canadian apples as No. 1 when they are really No. 2. All interested in the trade express their appreciation of the thorough manner the Canadian Government follow up those guilty of infraction of the law, and they approve of the system of publishing the names of all persons guilty of dishonest grading. These names are freely distributed in the trade, and results were shown before the end of last season in improved grading, which has continued this year. One shipment of about 15,000 barrels which was loaded at Halifax, called at another port for general cargo, and arrived at Liverpool on October 12th in a pretty bad state. The softer varieties were dead ripe on arrival here, and the extra delay at port of call did the fruit a lot of harm.

STATEMENT OF ARRIVALS.

The arrivals to November 4th, this year are 236,677 barrels, as against 208,649 barrels for the same period last year.

The receipts of apples at Manchester up to the 31st October this year are as follows:—

	Barrels. Boxes.
Ontario..... ....15,844 506	
Nova Scotia..... 608	
United States of America.... 7,871 268	
Total..... ....24,323 774	

The quality of Ontario fruit received in Manchester has been satisfactory in every respect. The receivers here say that the grading and packing is—generally speaking—first-class. Apples have been arriving in a fairly advanced state of maturity and therefore rather soft. However, the landing conditions have been good, and the proportion of 'slacks' in Ontario fruit being exceptionally light.

During the last week of October, the decline in prices was specially marked being fully 2s. to 2s. 6d. lower than the ptevious week. However now that the bulk of the English grown crop has been disposed of, the general opinion is that the market for Canadian apples will recover almost immediately.

BRITISH APPLE IMPORTS.

The following countries are exporters of apples to Great Britain, and will show that Canada does not hold a monopoly of the British market, i. e.:—

Canada, United States, Belgium, France, Germany, Holland, Portugal, Tasmania, Denmark, Italy, Madera, Norway, Australia, New Zealand, Channel Islands and Newfoundland.

PUBLIC FRUIT SALES IN LIVERPOOL.

It may be of interest to Canadians to know under what regulations the fruit trade is conducted in Liverpool and Manchester. The bulk of the Canadian apples which are shipped to Liverpool and Manchester are sold by public auction, and it may be of interest to Canadians to know how these sales are conducted.

Liverpool and Manchester have each a large sale room where an association of fruit brokers conduct public sales on fixed market days with occasional special sales. Regular sales days in Liverpool are Monday, Wednesday and Friday, and in Manchester on Tuesday and Thutsday.

The sale rooms in Liverpool and Manchester are constructed with seats facing a pit which is below and in front of the auctioneer and which has a double elevator for raising and lowering samples from or to the basement below. Printed catalogues are furnished to buyers which give a description of the fruit to be sold, and also includes mark or name of shipper, number of barrels, etc., in lot, variety or varieties of apples, apparent condition, such as tight, slack, wet, slack and wet, etc.

SAMPLES OF LOTS FOR SALE.

Samples are taken from the dock (wharf) by the brokers, and no sample is admitted into the saleroom which has been opened or tampered with in any way. The packages (barrels or boxes) are not opened until ready to be raised into the saleroom, so that even the auctioneers have no idea of the quality of the fruit beyond what can be told before packages are opened, thus tights or slacks are told by sounding on end of barrel, wets or slightly wet are told by the outside appearance of package.

In both Liverpool and Manchester it is customaey to turn the sample shewn into large baskets before the buyers, so that there is nothing but a bad reputation to be gained by facing barrels with choice apples.

CONDITIONS OF SALE.

1. All fruit and produce is offered on the condition that the price paid be regarded by the buyers as the value of the sound goods contained in any package, whether the whole of such contents be sound or only a part thereof, and as regards such of the contents as are spoilt, damaged, or otherwise defective, so as to be fit for human consumution, such defective goods are not intended by the brokers, or purchased by the buyers, for the food of man.

2. The highest bidder (in due time) shall be the purchaser, unless the lot shall be withdrawn; and if any dispute arise, the manner of settling such dispute shall be decided by the selling broker.

3. The goods shall be taken away at the purchaser's expense, as soon as possible after sale, and any goods not rejected by purchaser during the day following sale shall be considered as accepted by buyer, according to the re-selection of selling broker's men, and shall afterwards remain on quay or in warehouse at the buyer's risk and expense.

4. Payment shall be made by cash before delivery, if required. No discount to be allowed. A deposit of 25 p.c. shall be made (if required by the selling broker) at the time of sale.

5. Each bidding not to be less than ½d. under 3s., 3d. under £1, and 6d. over £1.

6. It shall be at the discretion of selling broker to take or refuse the biddings of persons who have been defaulters.

7. Both seller and buyer shall be bound by the signature of the selling broker to the catalogues with buyer's names and prices affixed.

8. In the event of non-fulfilment of any of these conditions, the deposit shall be forfeited, and the fruit may be re-sold at the seller's discretion, either by public or private sale; and the seller shall be under no obligation to give notice of such second sale, but the loss, if any, shall be borne by the defaulter.

9. Buyers not taking delivery of samples by noon on the day following sale, will incur a charge of 3d. per package per day.

REGULATIONS OF SALES, TURNS OF SELLING, ETC.

1. That sales (called regular sale days) shall commence at a fixed hour and on certain fixed days as arranged by the brokers on which days the turns of brokers shall follow the order of the rotation card previously drawn up and agreed upon.

2. That sales on other days (called extra sale days) shall commence as arranged at special meetings of the brokers, and turns shall on such extra sale days follow the order of the regular sale day immediately preceding.

3. That on regular sale days the first turn of each broker shall not exceed forty minutes, second turn thirty minutes, and subsequent turns fifteen minutes; but on extra sale days, or when the time for selling on regular sale days is changed to any earlier hour, the first broker shall have one full hour for his first turn, after which the turns shall be the same as on regular sale days; when an extra sale is held on same day in consecutive weeks, extension to one hour for first sale shall not be conceded.

4. That no broker is obliged to commence a sale unless he has at least ten minutes before the dinner hour, and the broker whose turn expires within ten minutes of the dinner hour may continue to sell if broker next in turn does not choose to do so.

6f That any lot shall be considered small if consisting of less than 20 packages of any produce except tomatoes and mandarins in packages of 14 lbs., gross or under, which being in lots less than 40 shall also be considered small.

7. That a lot once passed be not offered again same turn, the selling of samples to constitute another lot. —W. J. Egan, Canadian Trade Commissioner, Manchester, England.

Storage of Apples.

A cold storage plant means to most farmers a huge commercial affair with various uses, one of them being to prolong the life of fresh fruit, especially apples.

Undoubtedly there are many advantages in the commercial storage center, to which growers can ship their fruit, to be stored until they see fit to sell it. More ideal conditions of storage are attained in the big concern than are possible in the ordinary fruit-cellar.

A storage-house, properly managed, maintains a uniform low temperature of about thirty-two degrees. It has the proper degree of humidity, a point at which fruit will not shrivel, nor yet be liable to molds and mildews. It has a continuaus circulation of air to all parts of the chamber, to insure an even refrigeration. Finally, it has constant change of air, in order to remove impure gases arising from decaying vegetable matter. The cold-storage plant of to-day usually does furnish these conditions, but nevertheless there are very great advantages in having a small storage of one's own.

The time that elapses between pick' ing and storing fruit may be several weeks, if the fruit must be shipped to a distant storage. If the picking is done in warm weather, the delay in getting to the storage may be very disastrous, especially to early apples. If the grower had storage for the perishable summer and fall apples, the customary glutted market in August and September would disappear, and failure would certainly be turned to success.

To get the best results in keeping all varieties of apples, several points should be adhered to most rigidly:

1. Store only A No. 1 fruit. Allow no wormy, diseased, or bruised specimens to slip in.

2. Pick apples that are still hard, but that are fully developed in size and color.

3. Wrap in unprinted newspaper. If the cellar is apt to be either very dry or very moist, another wrapper of oiled paper should be wrapped over the newspaper.

4. Have fruit cool throughout the package before it enters the cool cellar. Usually the smaller and tighter the package is, the better will the fruit keep.

A very cheap and suitable cellar for storing apples can be made of concrete, preferably with a hollow wall. The walls should be as far as possible under the ground, so as to be naturally cooled by the earth. The cellar is cooled by ventilation, also. In warm weather usually the inlet and outlet valves are opened only at night, and in cool weather they may be opened during the day. In order to have the air somewhat tempered before entering the cellar, the inlet is placed seventy-five feet or more away from it, and connects with it by means of a tile pipe laid several feet below the surface of the ground. The inlet proper is at the top of a pipe standing perpendicularly eight or ten feet above ground. It consists of a revolving hood attached to the pipe. The wind controls this hood and creates a forced draft through the tile pipe into the cellar. The warm air passing through will be cooled, and much moisture of condensation will remain in the pipes, instead of entering the cellar. The outlet should be through the roof, and should be larger in cross-section than the inlet. With a little experience one can learn to operate the ventilator so as to secure an even low temperature at practically no cost.—A. J. Rogers, Jr.

Black Knot.

On page 150 of the report on agriculture by the government of Nova Scotia for 1910, H. W. Smith B. Sc., Biologist Agricultural College, Truro, says:—

Black Knot.—"This disease of plum and cherry is caused by a fungus. The spores find entrance at any time during the growing season into the tender bark where it grows and eventually bursts the bark, producing a light swollen spot. From this spot are shed multitudes of small spores during the season; then dark colored bodies arise in the spot causing the well known black knots. From these knots ascospores are produced which will also cause the disease when they fall in a suitable place on the young limbs."

While this may be true, it is no more than theory; and other causes than the one here stated, may bring about that condition in plum trees which proves so destructive to plum orchards all over the country.

If I understand what Mr. Smith says, he confirms the operations of the spores of black knot to the bark of the plum and cherry. I here beg to differ from my learned friend. I venture to assert that black knot is not merely a SKIN disease but a BLOOD disease as well. Experienced fruit growers will agree with me that black knot is in the sap and is therefore constantional. It does not always make its appearance in the fruit first.

In this connection I venture the assertion that where the soil is adapted to the growth of plums, with thorough underdrainage, thorough cultivation, proper and judicious pruning, black knot is not any enemy worth fearing. I should like to say that [illegible] are scared by such thing as black knot, and fear to plant trees; but the conditions that produce this disease are caused by the treatment given that tree by the planter and cultivator.

All theories are not absolutely correct, and the spores of black spot on apples may not be what scientists claim. Spraying, which is now claimed to be such a necessity for insects, may also tend to diminish black spot in apples; but the conditions that produce black spot must be looked for elsewhere than on the tree.—M. D. Currie, Grand Mira, So. C. B.

Hillcrest Orchards.

The finest and most up-to-date lot of apples which we have ever seen came from the famous Hillcrest Orchards to the Railway station, last Monday, for shipment to Scotland. The lot which was but a part of the shipment comprised 437 boxes, each containing one third of a barrel. The boxes were neatly made and one end of each covered with a large, three-color lithograph of three big apples with the inscription "Nova Scotia apples, grown and packed by Hillcrest Orchards Co., Ltd." and also the orchard brand "No. 1 Kings" or "selected." The fruit itself was probably unexcelled on this continent. The enterprising manager Mr. R. S. Eaton certainly knows how to grow apples by scientific culture and also to prepare his shipments in a way that cannot fail to capture the market wherever they are sent. The fine half-tone cuts of Hillcrest which were put inside of each box, were at once a splendid advertisement and a beautiful prize. Up to Oct. 12th this and 9,000 barrels, including about company had harvested between 8,000 2,000 barrels of Gravensteins, which is probably the largest crop harvested, this year in Eastern Canada. Hillcrest is a striking illustration of what can be done, with efficient management and scientific methods of culture, in apple raising in this valley.—Western Chronicle.

Rhubarb for Winter.

It is now time to dig up a few clumps of rhubarb to have them in reserve for winter forcing. This winter rhubarb is far more brittle and delicious than what we can grow in open air in its regular season. Leave plenty of soil on the clumps, and leave them outdoors under a shed or in some place where we can easily get at them later on, even after a deep snowfall. After the clumps have become frozen solid, they can be used for forcing at any time. A dark corner in a warm cellar is a good place. A spot three or four feet square will give you quite a number of messes during the winter. Pack the clumps in rather closely together, upon a layer of soil, and cover with soil to the depth of at least a few inches over the crowns, and then let them grow. If not dark enough, put a box around the bed, and cover it so as to exclude the light. Try half a dozen plants in this way, anyway.

Double the Egg Yield of Your Flock!

The poultryman who has been feeding grain and who starts feeding fresh cut green bone, can cut his feeding costs in two and double his egg yield—to say nothing of being able to raise better table fowl. The

PEERLESS GREEN BONE CUTTER

will enable you to feed at a cost of 1/16¢. per hen per day—to get more eggs—a greater percentage of fertile eggs—more sturdy new-hatched chicks—to push your pullets to earlier maturity—to have younger layers—to send your fryers and broilers sooner to market and get higher prices on a lessened feeding cost; in fact, to make more money in poultrying.

Send for our FREE book that tells all about green bone feeding, how to buy, cut and feed green bone RIGHT. The correct feeding of green bone is the foundation of poultry success—send a postal to-day for the book.

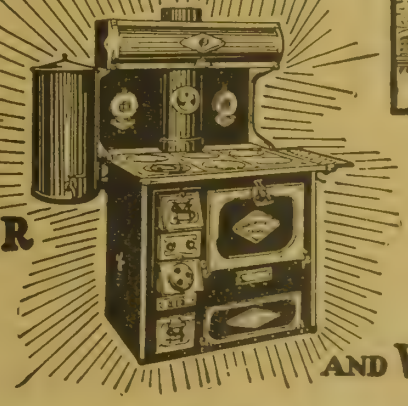
DIRECT FROM FACTORY TO KITCHEN

SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.



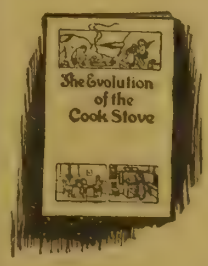
$41.00 TO $49.00 AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of tough, strong, malleable iron and the best blue polished steel—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it saves over 30% of fuel, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41.00 to $49.00 according to size, or to the four Western Provinces for $44.50 to be sent with order. Freight to be paid when the Range is delivered at your station. If not convenient to pay cash we will arrange to accept your note.

Canada Malleable & Steel Range Mfg. Co., Limited, Oshawa, Ont.

When writing it will be a distinct favor to us if you will mention this paper. 7

DAIRYING.

A New World's Record.

Editor Maritime Farmer:—

During the month of March, 1911, there appeared in your columns the records for five years of the Holstein cow "Flora Wayne of Riverside" (2414), owned by the Nova Scotia Agricultural College, Truro, N. S. Readers will remember not only her tremendous persistent milk flow, but also the great weight of her calves at birth, the average for five years being nearly 120 pounds.

A three year old daughter of above cow "College Flora" (9586), bred and raised by the N. S. A. C., which weighed at birth 136 pounds dry, dropped her second calf on November 28th, 1911, the same weighing 145½ pounds dry; a world's record, so far as we can ascertain. This is an exceptionally promising bull calf by their herd bull "Count Mercena Paul" (6827), a son of the noted cow "De Kol Pauline Sadie Vale" (5944), owned by James Rettie, Norwich, and twice female champion at Toronto National.

"College Flora" (9586), under adverse circumstances, made a 2 year record of over 8,000 pounds of milk. Her first calf, a heifer by the only son of "Helbon DeKol" (5631), Canadian Champion for 7 and 30 day tests and also for 3 year Record of Performance over all breeds, is a very promising yearling. The N. S. A. C. Farm has also bred and raised several other yearling heifers by this great bull. The total Holstein herd, now numbering 35 head, is making a splendid showing, and, even with the severe summer of 1911, is in A 1 condition.

The Ayrshire herd, of equal size, is doing fully as well. The famous cow "Annie Laurie of Norwich," 13 years of age, during the year 1910-11, in 365 days, made 9213 pounds of 4 per cent. milk and dropped a promising heifer calf. Her last calf, a yearling bull, is going to a very progressive Agricultural Society in Cape Breton.

The three year old heifer "College Merry Maid" is completing her Record of Performance test with 8315 pounds of 3.96 per cent. milk. A row of Ayrshires 2 year old, imported and home bred, give great promise as producers.

Other breeds are doing equally well and live stock interests are booming in Nova Scotia.—E. S. Archibald, Truro, N. S.

Cream Cheese.

Owing to the number of inquiries received lately for information on the subject of soft or cream cheese, Miss G. Bagnall, instructor of dairying at Macdonald college, has, at the request of the dairy commissioner, Mr. J. A. Ruddick, prepared the material for a very helpful and instructive bulletin, which has just been issued by the department of agriculture. It is as follows:

$15.95 AND UPWARD
AMERICAN SEPARATOR
SENT ON TRIAL, FULLY GUARANTEED. A new, well made, easy running separator for $15.95. Skims hot or cold milk; heavy or light cream. Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from ST. JOHN, N. B. and TORONTO, ONT. Whether dairy is large or small, obtain our hand-some free catalog. Address,
AMERICAN SEPARATOR CO. Box 1212 BAINBRIDGE, N. Y.

The process of manufacturing this particular variety of cream cheese is inexpensive and simple, and the cheese is so profitable that farmers should encourage their wives and daughters to follow these instructions, so as to be able to furnish their tables with a good wholesome and nutritious article of diet. If made from fairly rich cream it will contain from 40 to 50 percent. of butter-fat. Butter-fat is more easily digested than other fats, and should therefore, prove most beneficial to invalids. With or without butter it is most palatable, and makes delicious sandwiches. During the three years that this cheese has been made at Macdonald college, the demand has increased from four dozen to sixty dozen per month.

ITS MAKING SHOULD BE ENCOURAGED BECAUSE:

1. It is profitable. The cream from 100 pounds of average milk will make twenty-five cream cheese, which retail at 15 cents each, or equal to $3.75 per 100 pounds of milk.

2. The return is quick, the cheese being marketable in three days, thus saving the expense of storage.

3. The initial cost for equipment is very small. A cream cheese mould, which may be bought for fifty cents, and a few yards of butter muslin are about the only extra needs in a well equipped farm house.

4. In a clean, airy room, with an even temperature, it is almost impossible to go wrong, and thus have a loss.

5. The demand is greatly on the increase, and as soon as it becomes more universally known it will be extensive.

An airy and easily cleaned room with an even temperature that can be maintained between 60-65 degrees F. is necessary. The influence of heat and cold on the texture, flavor and yield of cheese is very important. If the temperature of the room is too high, the yield will not be so large, and the quality of the cheese will be impoverished owing to a loss of fat, while on the other hand, should the temperature fall much below 60 degrees F. the draining process will be retarded, resulting in a bitter flavor in the cheese, instead of the clean, nutty flavor that is desirable.

Cream containing 15 percent. butter-fat is sufficiently rich for this cheese. It may be taken from the separator at this thickness, or else richer cream may be brought to the above fat content by adding skim-milk. As a rule. four gallons of milk, testing 3.7 percent. butter-fat, will be found to give one gallon of cream containing 15 percent. butter-fat.

The requirements are as follows·

A little fresh buttermilk or clean sour skim-milk, will make a good starter.

Rennet may be used in either the extract or tablet form. Where only small quantities are used, the tablets are best, as they are more easily obtained fresh in small quantities, and they keep better. Rather less should be used than is recommended in the directions for junket, as for this cheese a soft curd is wanted, which will take from two to three hours to coagulate. Rennet tablets may be procured at most drug stores.

Use pure dairy salt, which will dissolve readily.

Ordinary white enamel pails, holding from two to three gallons each are very suitable for holding the cream; white enamel bowls are of the most convenient shape for holding the cloths, while ladling the curd.

A thermometer is an absolute necessity where uniformity in cheese-making is required. Those made of glass only are best.

Either huckaback, or fine linen towels, about 30 inches square, should be used. A texture, not too coarse nor too fine, is necessary to allow of easy drainage without loss of fat.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.
We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Empire Cream Separator Co. of Canada, Ltd.
Sussex, - - New Brunswick.
Farm Agents Wanted in Unrepresented Districts.

When rennet extract is used, it is well to invest in a small drachm glass for measuring the rennet. These glasses can be got from any chemist, graded to show the number of drops. They cost 25 cents each.

Either a table, or sink with a slope is required, from which the whey can readily escape while the cheese is pressing between boards.

A cream cheese mould, which may be round, square or oblong. gives the cheese a more uniform appearance, and hence more marketable. Should the cheese be required for the home table, it can be made up into balls with the butter paddles.

Ordinary white butter muslin. One yard muslin, 36 inches wide, will cut into 49 pieces, each five inches square, which is the correct size for the round cream cheese mould.

A perforated skimmer is necessary for ladling the curd from the pails into the cloth.

Grease proof parchment paper will be required to wrap the cheese in if it is to be sent to market. It can be obtained from any dairy supply house. Cardboard packages can be had from any of the folding box manufacturers, and cost from three to five dollars per thousand.

AGE FOR MARKETING.

Cream cheese is best eaten fresh. Its weight being four ounces only, it will naturally dry up very easily. They should not be sold over a week old, and they should be on the market in three days from the day of starting their manufacture.

Requirements for ten cheese:—

One gallon cream (15 percent. butter-fat).

One tablespoonful of starter or buttermilk.

Twenty drops of rennet extract, or equivalent in tablets.

Dairy salt.

Thermometer.

A pail, bowl, skimmer and spoon.

Two huckaback towels and some string.

Cream cheese mould and some muslin.

THE METHOD OF MAKING.

1. Put the cream and starter into a clean vessel and mix.

2. Get the temperature between 80 and 84 degrees Fahrenheit.

3. Dilute the rennet extract with five times its bulk of water, in order to facilitate mixing. Add it to the cream stirring gently and thoroughly for two minutes.

4. Cover with a cloth to retain the heat, and let it stand for two or three hours, or until a nice, soft curd is formed.

5. Spread one of the cloths in the bowl, then with the skimmer gently ladle the curd from the pail into it, being careful to take thin slice, and to break it as little as possible.

6. Gather up the cloth and tie with a string, without crushing the curd, then hang it up to drain on a stick placed between two chairs, or in some other convenient position, with the bowl placed underneath to receive the whey. Let it drain from 12 to 24 hours.

7. When sufficiently drained, turn with salt to taste, and knead in the cloth to thoroughly mix the salt.
the curd into a clean cloth, sprinkle

8. Then fold the cloth neatly over the cheese and place between two boards to press, with a brick on top, and leave for a few hours or until the cheese is of the constituency of newly churneh butter; it should, however, be less sticky, and of a more mealy texture than butter.

9. Cover the lid of the mould with a piece of muslin, and place another piece of muslin (6-inch square) in the mould. Put four ounces of the cream cheese curd into the mould. Put the lid on the mould and press with the hands; by this means the curd takes the form of the mould. Fold the ends

Used in Canada for over half a century —used in every corner of the world where people suffer from Constipation and its resulting troubles—

Dr. Morse's Indian Root Pills,

stand higher in public estimation than any others, and their ever-increasing sales prove their merit. Physicians prescribe them. 8

of muslin over the curd and press again, when the cheese may be taken from the mould and wrapped in parchment butter paper.

The weight of each cheese should be four ounces, and the retail prices should be fifteen cents per pound.

A copy of this bulletin, No. 30, may be had upon application to the department of agriculture, Ottawa.

Advertising Butter.

Vice Consul General Henry D. Baker, on special service in New Zealand writes in Daily Consular and Trade Reports:

Co-operative effort has lately been made by dairy interests of New Zealand to promote the sale of their butter in England through a comprehensive plan of advertising in English newspapers. Since the first of this year about $15,000 has been spent on this campaign.

One full-page advertisement that has come to my notice mentions that "New Zealand butter is made under the strictest Government supervision, under ideal conditions, from cattle grazed on the grandest pastures of the world," and that "the steamship Tainui has just arrived with 3,345,644 pounds of this splendid butter, and it is now on sale by grocers and provision merchants throughout the United Kingdom." A list was given of nearly 900 dealers in London who had undertaken to make a special display of New Zealand butter in their windows on the day the advertisement was printed. It is stated here that the English retailers have reported splendid results from this scheme of advertising.

The National Dairy Association of New Zealand now has an agent in London especially to look after the promotion of the butter and cheese business, and the Minister of Agriculture of New Zealand has just announced that he will appoint an officer, who is a dairy expert, to special service in England to further the dairying interests of the Dominion.

Suggestions on Calf Feeding.

Nature has provided something in the first milk that is very essential in getting the calf's digestive machinery started right, and I think it should be permitted to have it. We usually leave the calf with the cow a couple of days, until it is nicely straightened up, then comes the most important time in the life of the calf, when we take upon ourselves its feed and care; and here is where we want to exercise a lot of kindness and gentleness, for if we are impatient and rough in our treatment with them they will distrust and fear us, and the chances are they never will forget those first lessons and impressions. A cow never will do her best unless she has perfect confidence in us.

It is an old saying that you can catch more flies with molasses than with vinegar; so you can do more by caaxing than driving. When teaching the calf to drink, don't push its head into the pail; wet your fingers in the milk and let it suck, and coax its head into the pail, and usually the second or third time it will drink of its own accord.

ESSENTIALS.

These are three essentials at this time: The quantity of milk, the temperature, and quality. Calves are injured more by not observing carefully these rules for the first few weeks of their lives than any other way. At this age their little stomachs are not strong, and a little care exercised at this time often means the difference between an unprofitable and a profitable animal.

The amount of feed at this time will depend largely on the calf and somewhat on the nature of the milk. This amount must be determined by the feeder, but this precaution is always advisable—better to begin carefully and work up to what they can handle, rather than to begin with a large amount and get them off their feet and then have to commence all over again.

DON'T GUESS AT THE FEED.

The amount to be fed should not be determined by guesswork, but by actual weighing or measuring, for I find it so easy to overestimate.

No artificial heating of the milk is so good as the natural animal heat, which is about 100 degrees, and we try to retain this temperature as near as possible. The mother also furnishes the milk in a sanitary condition, and we should try to follow her example in this respect and see that the pails are kept in a cleanly condition.

We also notice that quite early in life the calf will begin chewing on something, possibly a straw or piece of hay. Now is the time to educate it to eat oats, and a few minutes in getting its head into a basin or box is time well spent. Oats are nourishing and invigorating and the chewing process has a tendency to start the saliva, which, when mixed with the gastric juices of the stomach, makes the digestion easier and more complete.

A little nice, clover hay should be reserved for them, and when they are nicely started on these, then skim-milk can be substituted for whole milk; but when changing over, make the change gradually, by taking out a little whole milk and substituting skim in its place till the whole milk has been changed over, possibly requiring a week's time.—Extract from an address by F. H. Scribner, Wisconsin, U. S. A.

Dairy Thoughts.

Sell your bull calves as soon as you have decided on the number of beasts you can carry. Always keep a heifer in preference.

Though the rule is that the milk after the third calf is the best, many cows give as good a yield with their first as with later calves.

It is surprising what a change in the appearance of the cows and of the dairy is presented when the flanks of the milch cows are clipped.

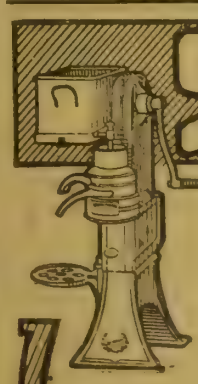
Keeping a record of the yield of the cows enables you to decide quickly which of the progeny to keep on the place and which to send to the butcher.

Emery rod and Towel drier—*found Only on Pandora*

McClary's *Pandora* Range

When a knife is dull a Pandora owner never wastes time hunting for a "steel." She just walks over to the emery rod attachment to Pandora, gives knife six or eight passes over the high-grade emery, which puts on the keenest kind of an edge.

This combined emery rod and towel drier is a patented attachment you cannot secure on any other range. Just one of the many improvements that go to make Pandora the handiest range you can buy 14



STANDARD CREAM SEPARATOR

Constructed on approved mechanical principles
Made up of materials of superior quality only
Embodies the points of advantage in all other Separators
Has four important improvements excluded from all others by our patents.
Costs very little more than ordinary Separators
Saves 10 to 25 per cent. over all others.

It will pay you to investigate

LIVE STOCK.

Mange in Cattle.

There are at least three different forms of mange in cattle, but the most common one is "Psoroptic Scabies," and the essential cause of this disease is a small parasite known as the "Psoroptes bovis," which is much of the same appearance as the mange in the horse or sheep, but it has this difference, that the parasite which causes mange in cattle will not live on any other animal, and if they are transferred from, say, the cow to the horse, they only live a short time.

It is well known by all those who are familiar with this disease that when stock is turned out to pastute in the spring the irritation largely if not entirely, ceases; it being maintained that the freer secretions derived from the young and succulent grass supply the wants of the parasite in summer, so that it does not care to bite. It has been stated that in the summer months these parasites disappear entirely, but this is far from being the case, as observations have proved that the parasites were still there and that they were to be found in large numbers at the base of the horn and on the neck. But although they invest the animal, they do not appear to cause any great irritation at this time of the year, as they seem to feed on the hair and surface of the animals, whereas later in the fall, as the weather gets colder, they begin to burrow into the skin and cause intense itching.

The parts of the animal which appear to be most infected are the root of the tail, the thighs, and often the neck and withers. The symptoms of the disease is an intense itching, the animal rubbing itself against all possible objects, often causing bleeding of the parts effected.

A careful examination of a freshly attacked spot shows the presence of small elevations of the skin about the size of millet seeds, which may become confluent and are killed with serum. These break and agglutinate the hair, and drying, form crusts of increasing thickness which become very adherent, and which gradually increase in size, number and extent. Underneath these crusts, particularly around the margins of the same, may be found the multiplying Psoroptes which can be detected by the naked eyes, or better by means of a lens when the crusts are placed on a sheet of black paper in the warm sun. The skin loses its hair and becomes dry, thickened, and marked with crevices or cracks particularly in the region of the neck, shoulders or the chest. The affected animals gradually pass into a state of cachexia, becoming emaciated and eventually dying from mal-nutrition.

MANGE NOT LICE.

It sometimes happens that lice and other affections have sometimes been mistaken for mange. Lice will produce violent itching, and also cause loss of hair. Of course lice are easily recognized, and they are generally to be found at the base of the horns, the upper portions of the neck, and the root of the tail. At the same time it must be borne in mind that where you find mange you generally also find lice, but the treatment of mange is generally very effective in the case of lice.

Ringworm, found frequently upon calves or it even may be upon adult cattle, produces a well defined circular, scaly lesion, the favorite locations in cattle being in the neighborhood of the eyes and ears. A positive diagnosis of mange can of course be obtained only by the recognition of the Psoroptes bovis. For this purpose crusts from the affected portions are to be teased out over a piece of black paper in the direct sunlight and examined preferably with a lens magnifying from ten to twenty-five diameters.

TREATMENT OF MANGE.

There have been quite a large number of various kinds of dips and solutions, used in trying to cure or eradicate this disease, but many of them, like the coal tar and kerosene dips, while perfectly effacious in curing scab in sheep can by no means be recommended to cure the same in cattle. Mercurial and arsenical dips are to be avoided, as the danger of poisoning through skin absorption or the habit that cattle have of licking themselves, is too great. The best results have been obtained through the use of tobacco and sulphur, or lime and sulphur preparations. In the tobacco and sulphur dip, there should be sufficient extract of tobacco or nicotine solution to give a mixture containing not less than 5-100 of one per cent, of nicotine, and sufficient sulphur to give a two per cent. solution.

The lime and sulphur dip contains more lime than when made up for the treatment of sheep scab. It should ontain 12 pounds of unslacked lime and 24 pounds of flowers of sulphur to 100 gallons of water. The lime is to be placed in a mortar box and sufficient water added to slack the lime and form a sort of paste or putty. To this the finely sifted sulphur is added and the mixture thoroughly stirred.

This is then placed in a boiler, 30 gallons of water added and the mixture boiled for at least two hours with frequent stirring, occasionally adding fresh water to retain the original quantity. This is then placed in a cask or other receptacle and allowed to settle for several hours. When fully settled the clear liquid is drawn off into the vat and sufficient water added to bring the total quantity up to 100 gallons. Owing to the labor involved in preparing the tobacco and sulphur, and lime and sulphur dips, many prefer to make use of some one of the proprietary products. The purchaser should, however, assure himself that the dip he contemplates using has the approval of the Department of Agriculture, as shown by a label stating that the manufacturers of that dip guarantee the contents to be of the same composition as the sample submitted to the Department of Agriculture.

In those cases where failures have been reported following the use of either of these dips when properly prepared and used, it can readily be shown to have been caused through returning the dipped animals to infested corrals, yards, etc., or from re infection from other cattle on the range.

Irrespective of the kind of dip employed the following general directions should be adhered to:

1. The temperature of the dipping vat should be constantly maintained at from 103 degrees F. to 105 degrees F.

2. Animals very badly affected should be hand dressed, by scrubbing the affected areas with a stronger solution of the dip. Where lime and sulphur is used, this has the effect of softening the scab and allowing the solution to penetrate.

3. Each animal should be kept in a vat for two minutes, and completely dipped twice.

4. All animals which have been in contact with the diseased ones should also be dipped.

5. The dipping should be repeated in ten days to destroy the parasites that may have hatched subsequently to the first dipping.

6. Dipped cattle should not be returned to infested stables or corrals.

The type of vat to be employed will be largely governed by conditions. Where only a small number of animals is to be treated the dip can be successfully applied by means of a brush or a spray pump. For larger numbers the cage type of vat costing from $125 to $200 may be employed. In this type of vat two or three animals are crowded into a cage which is then lowered into the vat. In many places, however, the swimming type of vat has been more generally used. The animal is crowded forward on a trap which is then sprung, precipitating it into the vat, through which it swims, emerging by an inclined plane to the dripping floor.

By the method of treatments briefly outlined mange has been eradicated in many parts of the States. In this western country, when an outbreak of mange occurs, with open range conditions, eradication is quite difficult. A strict quarantine of the undipped or exposed herds can hardly be kept. Again possibly one man may have dipped his cattle, and done all in his power to stamp out the disease, but his neighbor, whose cattle have also been exposed to infection, neglects to dip, or does not do it thoroughly, and thus the one man's newly dipped cattle are liable to fresh infection. However, these cattle may be compulsorily dipped on an order or certificate by the veterinary inspector of the Department of Agriculture. The regulations relating to animal quarantine, and the special mange order for Saskatchewan and Alberta, authorized by order in council June 8, 1911, in which the infected areas are specially defined, and under which stringent regulations governing the movements of infected cattle, and their transit through free areas, are set forth, should do a great deal within a short time to eradicate this pest from western Canada.—Farm and Ranch Review.

Shave with this Razor
Progressive Men Everywhere

Prolificacy and Milk-Producing Capacity in Sows.

It is a grand thing to own a breeding sow that is prolific, but it is no great advantage to possess a prolific sow that is not also a good mother, and by a good mother is meant ore that produces an abundant supply of rich milk, or one that, as the pigman expresses it, "does" her family well.

An extraordinary farrow in point of numbers is really a nuisance, unless there happens to be a sow with a small litter that has farrowed down about the same time, able to take to them; for most breeders (unlike Mr. Sanders Spencer, who tells us that he has killed as many as forty superfluous little innocents within one week) are very reluctant to destroy any of the too numerous progeny, and there must either be an attempt to rear them by hand—which is a troublesome and costly business—or all do badly and exhaust the sow.

BIG LITTERS.

For a sow to have more pigs than teats is of very little good to the owner, and it is much better for her to have half-a-score of strong, healthy pigs, or at most a dozen, for which she can provide sufficient nourishment, than to have farrows of from seventeen to twenty, or even more, the whole of which do badly. Breeders often hasten to record, and are apt to boast of the extraordinary prolificacy of their sows, but we very seldom see what the results of these large litters have been, for the very simple reason that at the finish there is not a deal to brag about. A sow regularly producing moderate litters to which she does justice is a much more valuable animal than one producing unusually large litters which she does not nourish properly. Prolificacy within reasonable limits is good, but extraordinary milking capacity is better, and when a sow exhibits this, and does her pigs well, she should be valued accordingly. Is not the milking habit as capable of cultivation in the sow as in the cow, and ought not more attention to be paid to it?

MILKING CAPACITY.

Mr. Sanders Spencer says that "this quality of milk-giving is not sufficiently studied by many pig-breeders, who take it for granted that well-nigh every sow which will produce pigs will, as a matter of course, furnish the latter with a good supply of lacteal food. This is an entire mistake, as there is nearly as much difference in the milking qualities of sows as in those of cows." As in cattle, so with pigs—the milking habit runs in families, and is susceptible of cultivation. But no cowkeeper would think of fattening his heifers intended for milkers or to produce milkers, and so the pig-breeder who desires to cultivate the milking of his sows should not fatten them while young, for it is rare that a young sow that is fattened almost from birth to maturity gives enough milk to raise her litter successfully. After the milking qualities have been established, the pig-breeder should bestow on his young sows the same care that the cattle-breeder takes in looking after the udder of his heifers,

"Best for Baby—best for you."

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.
Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use Gates' Life of Man Bitters and Invigorating Syrup No. 1. and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers.

Yours very gratefully,
John W. Margeson.

How to Completely Cure

and the same class of food should be given to promote the flow of milk.

WHEN TO DISCARD A SOW.

With reference to gilts which at their first farrowing leave something to be desired, both in the number of pigs produced and in the yield of milk for their sustenance, it must be remembered that there is no domesticated animal that so steadily increases in value as a breeder as the sow, and that, within reasonable limits of age, a sow may be expected to do better with each succeeding litter. A sow of good family that exhibits these valuable qualities as a mother ought to be kept for breeding as long as she produces even litters and rears them successfully and it is a mistake, although it is practised by some, and has even been recently advocated by an American professor to convert her into low-class or low-priced pork after taking one or two farrows from her, or in other terms, killing her before she has reached her prime as a breeder. A gilt that has produced only a small, unsatisfactory litter, or that has not done them well, may be allowed another trial, but if at the second venture there is no marked improvement, she should certainly be sold, or fattened out of the way, and room made for a better animal.

With further reference to the cultivation of the milking habit, as a rule little pigs are weaned, or rather removed (for to wean means to accustom gradually), too early, generally by quite a fortnight. The sow's milk being the cheapest and best food the pigs can have, they should not be weaned while she gives a reasonable quantity, and shows no sign of the youngsters being a drag on her, and a good sow will generally give a supply of milk for two months.—Pateley Bridge in Farm and Home.

Wisdom on Calf Rearing.

The care of the pen makes quite a difference about keeping the calf's digestion right.

The calves require more bedding than other stock. If they are permitted ta lie on a cold, damp bed, they take cold and that they are out of condition is shown by their rough staring coat, running noses and genetal unhealthy appearance.

Nature provides an abundance of sunlight, good ventilation and chance for exercise. Look out for all these things, as they all mean something to the dairy calf in keeping the digestion right and the building up of a good, strong physical frame.

The good old song "Let the blessed sunshine in," is just as applicable to our cow stables and calf stables as our Sunday Schools.

Young animals need especial care, as their growth and development require all the nourishment there is in feed.

Don't forget the exercise. Where calves are kept in a little four by six pen, with conditions just the reverse of what they should be—dark, damp, gloomy, ammonia-filled air to breathe, no chance for exercise—is it any wonder that the average production of our cows is so low when they have been brought up under these adverse conditions?

The fall calves usually make the best growth; possibly one reason being that we are around the barn more and notice their condition and can give them proper attention at the right time.

One quite common trouble with the spring calf is that we want to get it out on pasture altogether too soon, and skimmilk, grass, flies and hot weather make a mighty poor combination. We would rather keep them in through the summer, feeding them on good oats and clover and milk, and by paying attention to the stable conditions and exercise, they will make a better growth than if turned out.

A SMALL CROP IS A WARNING

A small crop is proof that your land is run down—it is a warning to fertilize promptly.

Manure is the ideal fertilizer because it contains the very elements that crops have extracted from the soil. To get 100 per cent value from the manure you spread, you must use a good manure spreader. The pitchfork method is wasteful, entails hard, disagreeable work, and takes too much time.

When buying a spreader, be sure you get one that will last. You can make sure of the quality, efficiency and durability, by investing in one of the

I H C Spreaders

Corn King **Cloverleaf**

These spreaders are used on thousands of farms. Their strength, simplicity, and durability are matters of record. Why not look into the matter?

When investigating, remember that the power transmitting mechanism used on I H C machines is the most durable used on any line of spreaders. This results from the fact that the beater gears are held in a single casting which prevents them from springing out of alignment and cutting the teeth. The teeth are long and chisel-pointed to insure positive pulverizing of all manure. There is no wedging of manure against the beater bars. The teeth do not rim the bars. The beater is large enough in diameter so that it does not wind. You will find many other striking advantages which will convince you of I H C superiority.

Why not see the I H C local agent at once? I H C spreaders are made in different styles, in many sizes for every need. If you prefer, write nearest branch house for catalogues and full information.

HANDSOME WATCH AND PHONOGRAPH

READ OUR WONDERFULL OFFER

We are prepared to give away *absolutely free* 1000 of these magnificent Gents' and Ladies' High-Class Watches, and an equal number of these beautiful Phonographs or Talking Machines. *Our Handsome Gents' Watches* can be had in either high-class American or imported Swiss movements, with cases either richly engraved or of highly polished gunmetal or solid nickel. *Ladies' Watches* are the beautiful small size imported Swiss watches in rich polished gunmetal or handsomely engraved gold laid case. *Our Watches are Absolutely Guaranteed forOne Year. The Beautiful Phonograph* is not a toy, but a high-class imported talking machine, complete with records. It can sing songs, tell stories or play orchestra music as good as a $25.00 machine.

YOU CAN GET BOTH WATCH AND PHONOGRAPH ABSOLUTELY FREE

If you will help us in your spare time to advertise and extend our business. Just send your name and address to-day, and we will send you postpaid, only 12 boxes of Dr. Edson's famous Life Building Blood Tonic and Nerve Pills, to sell for us at only 25c per box. They are a wonderful remedy for the cure of weak and impure blood, nervousness, indigestion constipation and are a grand tonic and life builder. *You Will Sell Them Very Quickly* because everyone who buys a box from you, at only 25c can receive free from us a grand present of fine silverware or gold-finished cuff links or ring. You cannot possibly fail to sell them. When sold send our money, only three dollars ($3.00), and we will promptly send you, all charges paid, *a Handsome Gents' or Ladies' Watch* and *the Phonograph you can also Receive absolutely Without Selling any more goods* but just by showing your watch to your friends and getting two of them to act as our agents and sell our goods. *Don't Miss the Opportunity of a Lifetime.* Write to-day, and you can soon be the proud owner of both watch and phonograph. THE HORSE.

Care of Colts.

To successfully grow and develop young colts requires some time and attention to weaning, feed, shelter, exercise, etc. Owing to the large number of colts on the farms in the Middle West many farmers are interested in the matter of feeding and care of the colts during the Fall and Winter. It is advisable to feed in such a way as to keep these youngsters in good flesh and growing rapidly. This is a matter of great importance, as a large number of colts begin to decline and go down in flesh at this season of the year. Every horseman knows that, from the time of weaning on through the first Winter is a critical period in the life of a young colt. Stockmen generally recognize the importance of retaining the baby fat on any growing animal, but many good farmers have not learned this fact, and, as a consequence, lose much time and money in growing the colt.

Colts should be taught to lead and eat grain before weaning. If they are eating well at weaning time, which, on the average farm, will be when the colt is from five to seven months old, that dam should be taken away and placed in a stall where she cannot hear the colt. With many mares it is better to keep the colt away altogether when weaning, while with others the milk should be taken away gradually. When the mare is a heavy milker, and especially if she has been running with the colt continuously, the colt may be allowed to suck three times a day at first, then twice daily and eventually the milk taken away entirely. This practice is also recommended where the colt has not been taught to eat before weaning. During the first few days it is well to keep the colts in a tight box-stall, which should be clean, airy and darkened to keep the flies out, in fly season, allowing them to take exercise in a yard or paddock where there is no possibility of injury from barbed wire or poor rickety fences, some time during each day of their confinement. Where there is one colt on the farm it is well to turn it in with some quiet horse that will not be inclined to fight or injure it in any way. After they have become accustomed to the new conditions they should be turned into a good pasture where there is plenty of water. If the flies and mosquitoes are bad it will be profitable to keep them in a darkened box-stall during the day and then turn them out at night; in either case they should have a small feed of grain (oats and bran) once or twice a day, depending on the age and condition of the animal, pasture, etc. Aim should be to keep the youngster growing right along, as the time to make a good horse is when the colt is developing bone and frame for the future. As the pasture becomes short the grain should be increased, and some first-class roughage supplied. Where blue grass or clover is abundant, this, with a slight grain ration will suffice until freezing weather, although the stalk field, if cleaned early will make a desirable run for the colts after the corn has been picked out by the cattle.

As the Winter comes on warm shelter should be provided where the colt may go in and out at will during the day and be shut up on severe, stormy nights. The stable should be kept clean and well bedded. Abundant exercise in the open air and sunlight are very essential to the best development of the colt. Nothing is more detrimental than the lack of exercise. A good blue grass pasture, where the grass has grown up rank in the Fall, is the ideal place for colts to run in the Winter.

The Winter feed for colts should be given care and attention if the best results are desired, as the first Winter of the colt's life is likely to have much to do with the future development of the animal. If kept growing and in good condition a strong and vigorous animal with plenty of bone and muscle will be the result. But if it is stunted and starved, much of its prospective usefulness is likely to be lost. The feed should be rich in protein and mineral matter, as these constituents are essential to the development of bone and muscle. It should also be furnished sufficient bulk to develop digestive capacity and keep it in a thrifty vigorous condition. Where draft horses are being fed it is very important that as much size and weight as possible be secured during the first two or three years of the colt's life. Early maturity in this class of colts is an important factor in determining the value of the horses. Size is all essential in first-class horses.

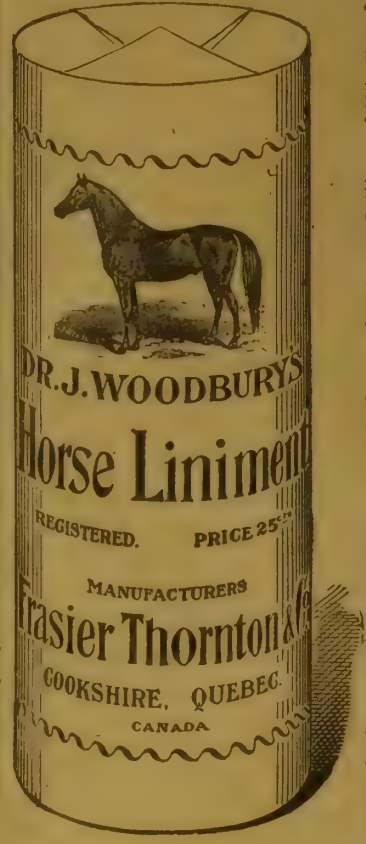
The bulk of the grain ration for colts should be oats. With this some corn, a limited amount of bran and a small quantity of oil meal may be fed. For roughage bright clover hay, free from dust, may be fed in racks in the yard or field, with good mixed hay in the stall at night. Bright oats, straw and corn stover will serve to give variety, which is of great importance in the ration of any animal. The quantity of roughage, should be controlled. Feed liberally, but never keep it constantly before the colts. Frequently it is cause for indigestion and disorder in the colt. A most frequent cause of disorder, poor condition, and lack of growth is the presence of lice. These are found especially during the Winter and Spring months. They should be destroyed when first found, if the weather is not severe. This may be done by washing thoroughly with a two per cent. solution of any of the recognized coal tar dips. The stalls should be whitewashed and sprayed with some antiseptic solution. Care should be taken to guard the animal against taking cold. If the Winter is open and rainy it is important that the legs and feet of the colts be kept free from filth and mud or scratches may develop and in such case will make serious trouble. In summing up it may be said that to successfully handle colts during the Fall and Winter months attention must be given to the matter of feed and water, exercise and shelter together with constant attention on the part of the owner, in order that none of the common ailments come in and seriously affect the growth and development of the animal.—Indiana Farmer.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For distemper, Strangles and colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. Woodbury's Horse Liniment to the hoofs of the for fe eet to prevent their becoming feverish, dry, brittle. hard, contracted or otherwise injured.



Insist on having Dr. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

DEAR SIRS—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumbermen should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

DEAR SIRS:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use Yours truly, C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper, and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right" 5817.
Elmsdale, N. S.

DEAR SIRS:—Kindly send me 6 dozen bottles Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly,
ELMSDALE MERCANTILE Co.,
Elmsdale, N. S.

DEAR SIRS:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

DEAR SIRS:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

E. J. ANDERSON, Truro, N. S.

One Line Pulling.

Many years ago I had at one time three horses that pulled to one side. They all pulled to the right. In degrees they differed, but in results they all reached the same goal, viz., aggravation of the driver's temper. One simply pushed gently to the right side of the track, and kept the wheels just enough to the side of the road to make the buggy ride hard. All the time, night or day, I had to ride just a few inches out of the track. It was disagreeable and exasperating. I tried all sorts of tricks with the reins, and even resorted to the cruel practice of jerking her back into the road. Another would strive to get a little further out of road, and failing to do so, would carry her head enough to one side to make her driver very nervous from the fear that she was going into the ditch. The other, a big, raw-boned specimen of the old "fox hunter" breed, made no bones of his efforts to reach the fence upon the right side of the highway. If I gave him the least chance he would dash clear over, and nothing but the fence would stop him. He was so bad that he was not safe to drive in the night. They were all three excellent drivers and good roaders, and it was quite an affliction to me that they should all of them have this same fool notion at the same time. I tried various kinds of bits and various devices, but none of them made any difference. It was a case of "hang to the left line," and I have recollections of becoming so exasperated at one time that I hit old "fox hunter" a hard clip with the whip and broke out singing "Keep to the right, boys." My hand would cramp from hanging to that line, and I would sometimes cross the lines to rest myself.

Now, up to that time I had believed myself to be a good horseman, and I endured the annoyance for some time before I humbled myself to ask for advice. At last I concluded that the fault was in myself, and I made a study of the driver, but a study of self is not usually pleasant, and I concluded to quietly let others drive them a few trips. But they all had the same trouble, and their experience proved that it was not all nervousness or imagination. Then I wrote about it to a horse journal, and as a result I received letters recommending more bits, and I was astonished by the number and variety of things invented to fit the mouth of a horse. Then in my desperation I wrote a very humble request for help and sent it to a well-known medical journal. In a few days my mail increased. I received letters from Maine and from California—good letters, friendly and fraternal letters. They told me of things I had not before considered, and as a result of the advice these letters contained I cured those horses of that vice.

The most common form of advice was in regard to the teeth of my horses. "File their molars," Inspect their teeth," 'Look for sharp edges upon the back teeth and file them smooth," "His teeth cut his tongue when he pulls upon the bit, and he has to hold his head that way to favor himself," "Pulling upon the bit crowds his cheek against a sharp tooth, and you must file away the sharp edge so he can press evenly upon the bit," "Sit on the other side of the buggy," "Hold

(Continued on page 165).

We wish to call your attention to the fact that most infectious diseases such as whooping cough, diphtheria and scarlet fever are contracted when the child has a cold. Chamberlain's Cough Remedy will quickly cure a cold and greatly lessen the danger of contracting these diseases. This remedy is famous for its cures of colds. It contains no opium or other narcotic and may be given to a child with implicit confidence. Sold by all dealers.

POULTRY.

Poultry Waste.

The greatest waste is in having no system of feeding. A particular kind of grain is fed day after day, without a change or variation in any manner, and the fowls apparently thrive on such diet, eat all of the food, leaving none to be wasted, but the poultryman does not see the waste of eggs that occurs simply because the hens are unable to produce them on account of a lack of certain elements that are not contained in the food allowed. A little consideration given the matter of feeding, though it might lead to a slight increase in expenditnre, would add much more to the receipts.

Neglect to repair the poultry house, so as to render it comfortable for the hens, leads to waste, and a rapid one, because it is seldom noticed until much damage is done. The streams of air call for more food to supply the warmth of body, and the poultryman's economy in attempting to make the old house do service without necessary repairs wastes his food, his labor, aud his prospective supply of eggs. The neglect to do his part calls for a neglect by the hens, and he is the one who must foot the losses. Imperfect preparations for supplying the food and water, and failure to clean the houses, are also sources of waste.

Attempting to make the scrub hens pay, when it costs but a dollar or two to procure a male, and improve the stock, is a kiud of waste that is in no manner excusable, for it is one of the most common, and each year's experience teaches the difference between good and infericr stock by simple comparison with the fowls in the yard of some more enterprising neighbor. To waste the time on scrub hens ends in disgust after a short time, the farmer being discouraged over results that should have been better, and which he ascribes to the business, when in fact his own wilful waste of time and food, by a system of extravagant economy, has entailed loss.

There ss a waste in not procuring that which saves time, labor and food, and every ounce of food saved, or time that would be lost, is so much on the profit side of the accounts, and is equivalent to actual cash received, no matter in what shape it may be.

In the matter of feeding, let us look at methods, and endeavor to draw some conclusion in regard to the causes of failure. When the hens do not lay, there is certainly a cause; but so many causes are in the way that to select the particular one is a difficult undertaking, as it demands not only practical experience, but considerable theorizing. Leaving aside the fact that a fowl may be sick or not properly housed, the main consideration is its condition. The kind of food to be supplied depends on the bodily condition of the fowl, and the hardest part of the work of management is to properly observe each fowl in order to judge of its condition, and thus learn how to feed for eggs.

To feed a fowl for market is very simple, but as the laying hen is a producer, like the cow, the object in giving her a place on the farm is not so much in making her valuable in the amount of meat on her body as to have her produce eggs. When the attempt is made to have the hen produce both meat and eggs, she will fail as a producer; but as she is both a meat producer and an egg producer the skill of deriviug either the one or the other lies with the farmer, and the work of the hen will be according to his management. The farmer knows that an egg is almost complete in itself. This fact is made plain because he knows that the egg will bring forth a live chick, complete in itself, with bones, down, fat, lean meat, blood and cartilage.

The chick could not be produced from the egg unless the egg contained all the nitrogen, carbon and mineral matter essential to the production of a living creature. Unless the hen can secure the materials to store in the eggs laid by her, she will be incapable of fulfilling her duty. The mistake mostly made by the farmer is in supplying her with an abundance of one material and an insufficient of another. When the food is mostly grain, the hen is supplied with an excess of carbonaceous matter, a small proportion of nitrogen and almost no mineral matter, as grain is deficient in minerals. The consequcnce is that the hen supplie, first her own bodily requirements, produces an egg whenever there is an accumulation of the needed elements, and finally ceases to lay altogether.

When a hen receives food consisting of grain, mostly, any excess of carbon is stored on the frame of her body as fat, This fat accumulates until she is so clogged with it as to render the passage of an egg very difficult, while all the reproducuve organs are disorganized, Fatty degeneracy of the liver and heart, apoplexy and indigestion result. She has been fed liberally and well cared for, but she has not been feed properly for eggs. Her owner should have fed her on a variety, noting her condition, and withheld any food that caused a predominance of fat, thus feeding her in a manner to have her at all times in good laying condition. —Live Stock World.

FEATHERS WANTED.

Peerless Means the Utmost in Farm Fence Durability and Economy

The Peerless Fence is made to stand wear and weather. It is made of carefully selected, fully galvanized, spring steel wire. Stays springy and strong, always taut, never sags. Put a Peerless Fence around your farm and you'll get real service.

Read what users have to say about the Peerless:—

Concerning the quality and galvanizing of your fence, I think it perfect. I have compared it with other makes and every person where I put up your fence is well pleased with it and will not have any other fence on the place. I was at a farmer's not long ago and he stated that he was going to have three hundred rods of it in the Spring. I put up ninety rods for his neighbor four years ago and there is no sign of rust or slackness yet. The wire in your fence is tempered so as to suit the cold and warm weather and I have never had to go back to tighten one rod of fence that I have put up yet. I could mention different makes of fence, from firms well known, that their fences have rusted badly inside of three years. The Peerless is the farmers' favorite around here. —P. FOGAL, Cedar Valley.

Wherever I have seen Peerless Fencing that was erected five years ago there was no sign of rust and it seems to be as good as the day I put it up and I know of other fences that havebeen up only two or three years that are very badly rusted. This I am prepared to prove to anyone who wishes to see the fence for themselves, as the fences are here for inspection. I am well pleased with the material that you have used in your fences. —O. M. PASTORIUS, Harrow.

I have been comparing some of the Peerless Fencing that I put up the first year I sold fence and every wire is just as bright as ever, while some other makes put up about the same time have from one to three rusty horizontal wires running through it. I have always found the wire in Peerless Fencing first class. —EZRA FOX, Kingsville.

In regard to the durability of the Peerless Fence for the length of time it is up, I had an examination by myself and the parties I have put it up for, it surpasses any other wire fence for not rusting. Also the people I have dealt with give the Peerless Fence the preference before any other and if they were buying again would buy no other.
—W. H. Van ALSTYNE, Atkinson.

Peerless Fencing is the best galvanized fence and when put up properly is the best fence on the market today. I have some Peerless Fence, put up some four or five years ago, which is as bright as ever and tight, standing O. K.
—HOWARD BRUSH, Pitts Ferry.

Farmers speak well of your fence and I know of no fence that looks better for the years that it has been erected than the Peerless. I have never heard a farmer say that the Peerless showed any sign of rust yet.
—GEO. DAVIS, Clinton.

The best fence for you to put around your farm is the Peerless—it will last longest, give you the most satisfaction and save you money. Write for particulars. Agents wanted in all unoccupied territory.

Capons and Caponizing.

Farmers Bulletin 452 of the U. S. Department of Agriculture, treats on capons and caponizing and should be sent for and studied by all producers of capons. It is by Rob R. Slocum of the Bureau of Animal Industry and says in part:

"It is impossible to say just how long the operation of caponizing has been performed. It seems quite certain, however, that the practice was familiar, to the Chinese more than two thousand years ago. Later it was practiced by the Greeks and Romans and, through medieval times, by the people of middle and southern Europe, until in recent times it has been introduced into America. At present capons are most universally known and appreciated in France, although within the last few years the business of producing them has advanced rapidly in this country. Much the larger part of the industry is confined to that portion or the United east of Philadelphia, though increasing number of capons are being raised iu the North Central States. During the winter months capon is regularly quoted in the markets of the larger eastern cities. Massachusetts and New Jersey are the great centers for the growing of capons, while Boston, New York and Philadelphia are the important markets.

"Capons are usually kept till they are about 10 months old. At this time the market is at its best and the birds have made their most profitable gains. The feeds used and the methods of feeding vary greatly, so much so, indeed, that it is futile to try to give specific directions. For several months after the operation a good growing ration and not a fattening ration is required. It may consist of whole grains, ground grains, or a combination of the two, as each feeder finds most profitable and best suited to his locality. As with other poultry, variety must be given for best results. Late in the fall, when the capons have no pasture, green feed, such as cut clover or vegetables, should be provided. A somewhat more fattening ration than that required for laying hens seems to give good results.

"As capons are not usually marketed before Christmas or the first of January they have to be housed during the late fall and early winter. Because of their quiet disposition they stand crowning quite well and have been successfully housed with only two or three square feet of floor space to a fowl. It is better, however, to allow 4 to 5 feet if possible.

"During the last month or month and a half before marketing the corn in the ration should be gradually increased until the fowls are on a full fattening ration. For the last two or three weeks it is desirable to shut them up and feed them in crates, for every possible ounce at this stage adds to the appearance and profit. Machine cramming is sometimes practiced the last week with excellent results.

Dollar Bottle Free

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Heart of a Friend.

A heart that is glad when your heart is gay,
And true in the time of cares;
That halves the trial of the fretful day,
And doubles the joy that it shares;

A heart that can cheer your heart with its song
And comfort your hour of need.
A heart that is brave and faithful and strong,
Wherever misfortune may lead.

A heart that is yours when the wave seems dark
And yours in sunshine too;
A heart that cares not for rank or mark,
But only the heart of you.

A heart that will shield when others abuse
The name that it knows is fair.
That would rather miss fortune and fame than lose
The love of a friend that is dear.

A heart that will hear no ill of you
But is ever quick to defend;
A heart that is always true, steel true,
Such is the heart of a friend.

Love's Barrier.

(Continued from last issue).

CHAPTER XIII.

THE COURT FARM.

"Dear, dear, what's the matter; why, whatever is the matter?"

Jane came into her own sitting-room, which she shared with the children, and found them both howling dismally. It had been snowing a little, and was so bitterly cold outside thgt she had forbidden them to go out. She had only left them after the early dinner to see to the butter in the dairy, and she re-entered the house had been greeted by their wails.

"I hit Robin and daddy hit me," cried Billy, the elder of the two, rubbinb a pair of fat knuckles into his eyes, and then glaring over them defiantly. "When I'm a big man I'm going to kill daddy, so there!"

"Come, come now, Billy, we won't have this. Wipe your eyes and come and sit by me, and hear about the prince and the five pigs and the lame goose."

She picked up the smaller urchin from the floor and pillowed him on her breast. He was a very little chap with a thin white face and his mother's shrinking spirit. The sob died in his throat, as he nestled close to Aunt Jane's warm breast, and felt her arms closing tightly round him. Her face was very sweet as she leaned her cheek against his fair hair; the mother look was out upon it. She dearly loved the children, else surely she could not have stayed at the Court Farm. These four weeks had revealed to her much that she had not understood in the life of Emily Courtney, and at times she found it difficult to be as courteous as she ought to its master. Billy looked at her with a defiant air, which made his likeness to his father very striking.

"It's a silly old story, anyhow, and I shan't listen," he said rudely, and walking to the window, planted himself on the low seat to watch the falling snow-flakes. But presently his unwilling ear was caught by the low music of Aunt Jane's voice, and in spite of himself he listened. Then after a little he stole across the room, slid down on the floor at her side, and hid his face against her frock. Her free hand went out and touched him tenderly. He was a tiresome child, like the bigger one she had to mother, too, but she loved him; there was something sweet about his wilfulness. She knew what a sad heritage was his: the ungovernable temper of the Courtneys, their stubborn will, and implacable disposition had all found an abiding place in Tom Courtney'a eldest son. Already he had come into conflict with his father, whom he alternately feared and hated.

Jane had been horrified to find such relations existing between Courtney and his baby son. He was only six, and had a face like an angel, but sometimes all the powers of evil seemed to wage within him. It must be her task to try to guide the little one into the more peaceful paths of self-control.

Presently her voice ceased, and she felt herself nodding over the golden head, and then she saw that both the children were asleep. She rose very softly, laid the younger on the old couch, covered him up, and then stooped down over the little figure huddled on the floor. She scarcely dared to lift him lest she should awake him; taking a pillow from the end of the couch she slipped it under his head, covered him with a rug, and stole out of the room. They would be safe and happy there for an hour at least. The room was her own sitting-room, and the children's play place, which she found it advisable to combine. She had no idea that two smal, boys of four and six could be so exacting, or manage to occupy so much of one woman's time. She loved the work and the children, but realised that she could not attend to them and do all the rest that Courtney seemed to require of her.

"Got the brats quietened? It's pandemonium, isn't it?" said Courtney, looking up from his desk when she entered the living-room.

"They want occupying, Mr. Courtney, and I haven't quite as much time as I should like to spend with them. I have been thinking these last few days that if we could get some young girl to come for a few hours each day to teach them some simple lessons, and take them out, it would be good for everybody."

"Do as you like with them. I don't care! I can't manage them. They get on my nerves; then I hit them too hard, don't you know?"

"They don't want hitting at all," said Jane quietly. "It is the very last thing they do want, I assure you. I'll make some inquiries. I don't think there is anybody in Midcar, unless that niece of Ann Coyne's should be coming again. She is a school teacher, and I thought Ann said she was out of health and would stop a term with her to pick up. That would be the very thing. I'll go into Midcar this afternoon, perhaps, if the snow clears off."

"I'll drive you if you like. The mare wants exercising."

"I think I'll walk, thank you; it will do me good. I told Hester Strong we should not want her after next week. Was that right?"

'Anything is right that you do," said Courtney, glibly enough. "I don't want to be bothered about the household arrangements. That was one of Emmy's mistakes; she piled too many trifling details on to me. I've enough without side worries. If this new squire at Mardocks won't meet me in what I want for the Court, I shall leave it. Miss Jane."

"You would surely not do that for a trifle, Mr. Courtney?"

"Depends on what you call a trifle, doesn't it? I want some new barns and a cool hundred taken off the rent."

"I'm afraid they are not very rich, if what my sister-in-law says about them is correct."

"That's got nothing to do with me. He's bought Mardocks, and that took a bit of buying, you bet. Well, well, what about Midcar? Won't you let me drive you?"

"No, thank you, if I go I shall want to stop to tea at the Rectory."

"But I might be capable of calling for you there."

"Oh, yes," said Jane with a smile. "But let us leave it. There's somebody on horseback coming up the drive. I think it is Sir Anthony, Mr. Courtney. I saw him in church last Sunday."

Courtney sprang up and advanced to the window. As he passed her by Jane caught the whiff of the odour she hated and feared.

He had not yet redeemed his promise to her to leave the drink wholly alone, and when she had asked that it might be cleared out of the dining-room for good he had refused. He was better, certainly, but so long as the stuff was there and temptation convenient, she could not be at rest. She had pledged herself to rid the Court Farm of its curse, but with a man of Courtney's temperament she had to walk warily. He was a very fine figure of a man, and well suited his rough-riding garb. There were few to make a better appearance in the hunting field, but he had been absent from it continuously since his wife died. Jane realising that the healthy outdoor life was the salvation of such a man, was trying to persuade him to return to the field. But as yet she had not succeeded.

"Yes, it is Sir Anthony. Don't go," said Courtney quickly. "I particularly wish you to stop here."

"But he will wonder," said Jane with a slight flush. "I am only your housekeeper, and when gentlemen meet to discuss business it is unusual to have a woman present, isn't it?"

"I don't care a damn—you stop," said Courtney. Then she was perfectly certain he had been drinking, and wished it were possible to deny him to the new Squire. There had been a good deal of writing to and fro between the agents and Courtney, who imagined he had been badly treated, and that they were trying to get the better of him. The wholesome nature of the man had gotten a strange twist, and he could not regard any point from the normal view. Jane attributed it all to his abuse of the drink, which she so hated that it would have made her happy to see its sale and consumption prohibited throughout the length and breadth of the land. She could not escape, for at that moment the young house-girl showed Sir Anthony in. He was a well-built man with a military air; but beside Courtney's enormous height, he appeared almost insignificant. He bowed with great affability and offered his hand to Courtney, who stood sullenly by the table.

"Your wife?" said Sir Anthony, looking with approval at Jane's kind pleasant face.

"No," replied Courtney rudely. "My housekeeper."

Sir Anthony smiled genially.

"I had old Luttrell up from Bradfield this morning, Mr. Courtney, and he brought your letter with him. It seemed rather a large order, and I thought the best possible thing would be for me to come over so that we could have a talk about it."

"It's a letter I mean to stick to. These boundaries ought to be seen to, and the barns are a disgrace to any place. And the rent, as things go in these days, is ridiculous."

"But rents don't come down," said Sir Anthony with a shrewd but not unkindly smile. "Luttrell tells me there are half a dozen men after every place as it comes on the market. Doesn't look as if there was nothing but starvation on the land."

Courtney scowled.

"Well, you're welcome to keep it, Sir Anthony. My people have been in Court Farm for three hundred years, but I'm not keen on perpetuating the tenure. I've just about had enough of it, and unless I'm met a little more than half-way, I quit, see, at Lady Day."

The tone was gratuitously offensive, and Jane's colour rose ever so slightly.

"I think the difficulties might be overcome, but hardly in this spirit, Mr. Courtney," said the Squire a trifle more stiffly. "Isn't there any common meeting ground where we can discuss the matter?"

"Luttrell knows my mind on the matter, Sir Anthony. I haven't made a penny of profit on the Court Farm in the last three years."

"Then you would be a fool to keep it. Don't you agree, madam?" said Sir Anthony, with a sudden swift glance of inquiry at Jane.

"I quite agree," she answered unexpectedly, with a nervous glance at Tom Courtney, who stood gnawing his moustache and looking the pic-

MADE WELL AND STRONG

By Lydia E. Pinkham's Vegetable Compound

Toronto.—I gladly give you my testimonial in favor of your wonderful medicines. Last October I wrote to you for advice as I was completely run down, had bearing down sensation in the lower part of bowels, backache, and pain in the side. I also suffered terribly from gas.

After receiving your directions, I followed them closely and am now entirely free from pain in back and bowels, and am stronger in every way.

I also took Lydia E. Pinkham's Vegetable Compound before my baby was born, and I recommend it highly to all pregnant women.—MRS. E. WANDBY, 92 Logan Ave., Toronto, Ont.

Another Woman Cured

Maple Creek, Sask.—I have used Lydia E. Pinkham's Vegetable Compound and Blood Purifier, and I am now in perfect health. I was troubled with pains every month. I know other women who suffer as I did and I will gladly recommend your medicine to them. You may publish this if you think it will help others.—MRS. F. E. COOK, Maple Creek, Sask.

If you belong to that countless army of women who suffer from some form of female ills, don't hesitate to try Lydia E. Pinkham Vegetable Compound, made from roots and herbs.

BRONCHITIS

Was So Choked Up She Could Hardly Breathe.

Bronchitis is an acute inflammation of the mucus membrane lining the air tubes of the lungs, and should never be neglected, for if it is very often the disease becomes chronic, and then it is only a short step to consumption.

On the first sign of bronchitis Dr. Wood's Norway Pine Syrup should be taken, and thus prevent it becoming chronic.

Mr. John D. MacDonald, College Grant, N.S., writes:—"My little girl, seven years old, caught a bad cold which developed into bronchitis. She was so choked up she could hardly breathe. Reading about your wonderful medicine, Dr. Wood's Norway Pine Syrup, I decided to try a bottle, and with such good results that I got another which completely cured her. I cannot say too much in its praise, and would not be without it in the house."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; three pine trees the trade mark; price, 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

ture of gloom and indifference. Jane was intensely chagrined. He had been so sunny-tempered and happy in the morning; somehow and somewhere he had got the drink which in an hour's time had changed him. She longed to tell Sir Anthony Brede that it was not the real man talking to him. She could see that he was frankly puzzled and chilled by his reception. After all, he need not have come. It was a kindly, neighbourly act, rising out of his desire to get on amicable terms with all his tenants and new neighbours.

Well, it looks like a futile discussion, Courtney. Is there any chance of our coming to terms, I wonder? We might arrive at some understanding about the rent or even about the new barns, but it could not be both, Courtney; you must grasp that."

"I don't mind. I can quit, the sooner the better," said Courtney, and flung himself out of the room.

Sir Anthony stared after him, a trifle put out, then turned enquiringly to Jane.

"A regular fire-eater, eh, ma'am? Perhaps if you have lived long enough to find out, you can tell me what is the matter with him?"

Jane nodded rather sadly, and pointed to a black bottle standing on the end of the sideboard.

"It was not the real Tom Courtney who spoke to you to-day, Sir Anthony. Hasn't anyone told you yet? I rather thought the news had travelled as far as Bradfield."

"No. Ah! That puts a better complexion on it, at least from my point of view. No, Luttrell didn't mention it. If it's true he hasn't made a profit in three years the reason is not far to seek."

"It is not true at all," replied Jane quietly. "He is a first-rate farmer, and the place pays well. But when he gets the drink in, he's a different and very much more difficult person to deal with."

"Ah, then you have no sinecure here. Are there any children?"

"Two little boys. Their mother has not been dead above three months. It is all frightfully sad, but it is in the blood, apparently. Old George Courtney drank himself to death, but that was before my time."

"Ah, I think you don't belong to these parts, Miss—Miss——"

"My name is Secretan."

"Secretan! That's twice I've heard the name in one day. I met the Rector on the road as I rode out. Any relative?"

"My brother; and I have only been here since his marriage a few weeks ago."

"And so you are Miss Secretan!" Sir Anthony looked surprised, and yet more deeply interested. He liked the woman, she was so straightforward, and so true, and though she had no looks to speak of, and was past her first youth, there was something winning about her.

"So you were ousted from Midcar Rectory; it's the fate of sisters. But you need not stop here, you know, with a boor like that. There will be nothing easier than to find you something more congenial. I can speak to my sister about it. She has come to Mardocks to spend the winter with me. I dare say you have heard."

"Yes, Sir Anthony, and I saw her last Sunday in church."

"Ah, yes, so you did. Perhaps you can tell me then why your sister-in-law doesn't attend any of the services, nor do much in the parish. It seems there is a good deal of dissatisfaction about, and yet she is one of the most perfectly charming women I have ever met."

Jane's colour rose. It was a point on which she was abnormally sensitive. She loved Helen dearly, but she could not admit that she was doing her duty or that she realised the position in which she placed her husband by her indifference to all dear and sacred. Sir Anthony's pleasant sun-browned face took on the gravity of hers.

"Ah, I see. I've touched a tender spot. Well, we can't do anything, Miss Secretan. It doesn't pay to interfere with other folks' business. So you are Miss Secretan. It is a pleasure to think that you are here, and I hope for your sake as well as for his own, that you will be able to lick that cub into shape."

He held out a friendly hand. Jane liked his kind, frank face, his alert, soldierly air, and thought what a good thing it was for Mardocks and for the parish that he had come.

"I will talk to Mr. Courtney, and if you can see him another day when he has not been imbibing, I feel sure you will find him a very different man."

"I hope so, I'm sure. I shouldn't like to see the old stock out of the Court Farm. Three hundred years! Dear, dear! He has more right than any of us to the soil. I would sell him the farm if he wished. He ought to own the place his people have tenanted so long. I believe myself that that would be a solution of a lot of the land difficulties. Well, good day."

He went out smiling, good-hearted, simple, honest-minded English gentleman, and Jane was surprised to think how much she had enjoyed her totally unexpected interview. The children were still asleep, and leaving them in strict charge of the house girl, Tabitha Rowan, who really adored them, she got ready for her walk to Midcar. It was not more than two miles by the field paths, and as they were frozen hard she found very good footing and arrived just as Jimmy Bates, now installed in all his glory at the Rectory, was taking in his mistress's tea. Jimmy looked supremely happy. He had transplanted himself whole-heartedly from Colchester, and was charmed with his new home. Hannah, whom he had greatly alarmed at first, now regarded him as an ally and a friend. Peace reigned in the kitchen, and harmony in the parlour. Helen possessed the rare faculty of being able, without effort, to get the best out of those who served her. She had wrought great changes in Midcar Rectory. Each time Jane crossed the threshold she was conscious of it, and sighed a little because of what she had missed. Soft tones, quiet harmonies, books, music, and always flowers or leaves or something pretty to brighten the place, had robbed the Rectory of its barren look.

The six o'clock high tea had been

FREE!! $200.00 IN CASH

AND 1,000 VALUABLE PREMIUMS GIVEN AWAY.

1st Prize, $50.00 in Cash 3rd Prize, $35.00 in Cash
2nd Prize, $40.00 in Cash 4th Prize, $25.00 in Cash
5th to 9th Prizes, each $10.00 in Cash.

Herewith will be found the picture of an old man. Around his head and shoulders are concealed the faces of his seven daughters. Can you find these seven faces? If so, mark the faces with an X. Cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found the seven faces and marked them."

Write the above words plainly and neatly, as in case of ties, both writing and neatness will be considered in this contest.

Should you not happen to be a neat writer, show this advertisement to some friend of yours who can write plainly and neatly, and have him or her enter this contest in his or her name for you. First, agree with the person who is to do the writing that you are to receive any prize money or prize that may be awarded.

This may take up a little of your time but as there is TWO HUNDRED DOLLARS in cash and One Thousand premiums given away, it is worth your time to take a little trouble over this matter.

Remember, all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found the seven faces and marked them."

We do not ask You to Spend One Cent of Your Money in order to enter this Contest

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over One Thousand Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of Cash Prizes in our late competitions will not be allowed to enter this Contest.

Below will be found a partial list of the names and addresses of a few persons who have sent in their answers to our contests, together with the amounts they received. All these persons are entirely reliable, as they are well known in their districts. All previous winners of cash prizes are debarred from entering this contest.

abolished, and at seven a dainty small dinner was served which reminded Secretan of the dinner of the Restaurant Amadee. The study, which had a cold north outlook, had been furnished with drawn underblinds of yellow silk, which created a sunny atmosphere. Helen was sitting there when Jane was shown in.

"Oh, you dear! Did you know how badly I wanted you? Claude is at Bradfield, and will not get back till seven. It is something diocesan, but don't ask me what. I am glad to see you."

She kissed her twice and began opening out her coat.

'Did you walk from the farm? And how is the great hulking creature? I can't think how you can stand him. When are you coming back? Each day when I get up, I say to myself, perhaps Jane will come back to-day."

Jane drew a little quick breath. This love was very precious to her, she had had so little of it in her life.

"Dear, if I had only myself to consider, I should come now, and never go again." She touched Helen's clear pale cheek with her caressing finger, and they both smiled. So perfect was the understanding between them that it was a pure joy for them to be together. The wonder of it was seldom absent from Secretan's mind.

"I forgot about Bradfield, though I knew Claude was going. I think I am rather glad he is away to-day. I feel that I want you to myself; we haven't had a talk for ever so long. How sweet it is in here, how pretty, and how beautiful you look in that pink tea-gown. Who made it?"

"I aid. I had what Hannah called the "framed lady" sent up from Bradfield, and I am going to do all sorts of wonders. I have put it on as a surprise for Claude when he comes home, but I'm very glad to have your verdict. Do you really like it?"

"It's simply sweet. I can't think how your fingers are so clever. Mine plod and sew, but don't achieve anything, only keep the holes from showing. I always feel myself a great awkward person beside you."

Helen laughed aloud.

"Take off your hat so that I may feel you are not going to run off in a minute. So you have left your hair the way I put it! I told Claude I was sure you would take it down the moment you got home. It makes you look years younger."

"It takes me a lot longer time to dress it," said Jane smiling a little. "Sometimes I grudge it."

"You shouldn't grudge anything that makes you look nicer. It's one of the secrets of our power. Of course, you are lost on Tom Courtney, and I shall never, never get used to the idea of you being there. Why, the man isn't even a gentleman! Yes, Jimmy, come in."

Bates laid the table with conspicuous pride. His service was a service of love; his cherubic face wore an expression of absolute contentment. Jane smiled as she watched him finish his task, and then with a small bow retire from the room.

"That boy amuses me. He's so perfect."

"Jimmy?" said Helen with a little smile. "Yes, I think he is a perfect specimen of his kind. The boy has really a sweet disposition, and his adaptability is wonderful. Claude likes him; in fact, I think I am a little jealous of Jimmy's devotion to him. The missus takes only a secondary place."

"Claude has always attracted boys. It is his manliness," said Jane, as she leaned back in her chair, glad to rest and enveloped by the restful influences of the place.

"How do you think Claude is looking, Jane?" inquired Helen, looking at her straightly and at the same moment pausing in her act of filling the cups.

Concrete Sidewalks are Safe, Sightly and Everlasting

LUMBER used in damp places and on wet ground—as, for instance, in walks—has a very short life. It requires almost constant repairing and, in a few years, needs replacing.

Concrete, on the other hand, improves with age, and the very dampness which destroys lumber calls out the best qualities of the cement by making it harder and harder—until neither time nor traffic can affect it.

The best of wooden walks keep getting out of repair, and are a continual menace to life and limb. They are also a frequent source of expensive doctor bills and lost time. Then again, they are likely to eat up the original cost in repairs before they are replaced.

Concrete walks are sightly, everlasting and safe. They cost less to build and need no repairing nor painting.

Write for our *free* book, *"What the Farmer Can Do With Concrete."*

It tells in plain, simple language, how you can save money on farm construction by using cement for Barns, Dairies, Foundations, Fence Posts, Troughs, Feeding Floors, Hitching Posts, Stalls, Silos, Stairs, and so forth. The Book is well illustrated with photographs, plans and diagrams. Fill out the coupon or send a postal *to-day*.

Simply address it to

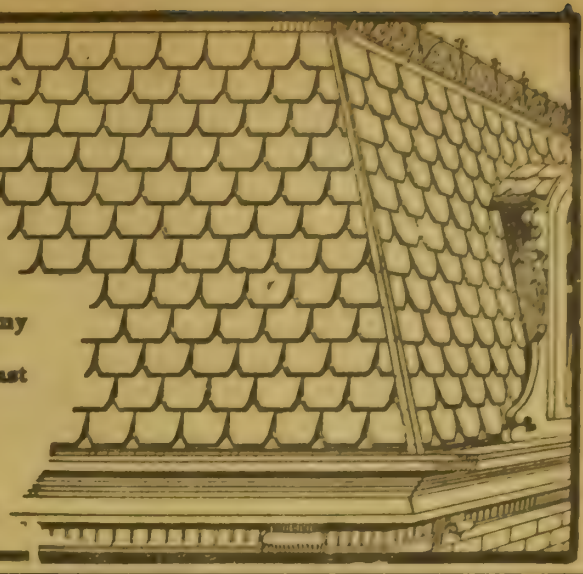
Apple Jelly.

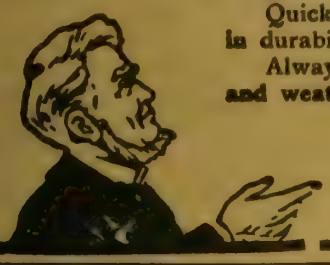
Apple parings, cores, and pieces of imperfect apples make jelly of bright color and fine flavor. Cover with boiling water and cook until tender, drain over night in a jelly bag. Or, if there is more than a bagful, tie a loosely woven cloth over a large jar, so that the cloth will bag enough to hold the fruit but not touch the juice as it drains. Useequal parts of juice and sugar, and cook until a drop will jell when placed on a cold dish. Remove all the skum as it rises. When ready ready to take from the fire, have a hot basin and cloth, the center of the cloth having been dipped into hot water. Drain each batch through this cloth and turn from the basin into hot tumblers. This makes a jelly clear as crystal. Mixed apple and rhubarb juice make good jelly.

A cross husband is about the meanest cross a woman has to bear.

That "EASTLAKE" Steel Shingle of ours



Known as "best for barns" for the past twenty-five years. Now known also as the best roofing for any building, any where.



Quickest to lay—economy in labor; longest to stay—economy in durability.

Always proof in all climates against fire, lightning, rust and weather.

Give us the measurement of any roof you wish to cover. We will send complete estimate of cost.

The METALLIC ROOFING CO., Limited

TORONTO and WINNIPEG

Farm Life the Natural Life.

A desire to "do something better than farming" has led many boys to town to a clerkship and to disillusionment. Things outside of our horizon often seem more desirable than any thing at hand. Our opinions are shaped more than we realize by the feelings—expressed or acted—of those about us. Many boys look upon their farm home as a place to stay till something better turns up. Parents might influence their children by creating an atmosphere of permanence to the boy's home life.

Talk over your plans and hopes with him so he will see where he fits into the scheme of things. Perhaps that will help him to come easily and naturally to your plans. Don't forbid him to go to town to work—that alone would drive some boys away—the opposition merely strengthening their resolves. Perhaps he doesn't understand the real conditions among city workers. With his lack of training he could only hope for a clerkship, factory work or labor of some sort, while it would be a long time before experience and promotions would increase his income to what it could have been on the farm. This, of course, applies to the average country boy without training who tries to make his way unaided among city workers. The average city worker, successful in his line of clerkship or trade, feels that he has done well if he keeps his family housed, clothed and fed and saves a little toward a rainy day.

Almost any farm that is worked with any degree of success does vastly more than that, while the farm worker is no slave to a time clock, or to the nervous strain of "holding his job." With the city worker, every stroke of the hammer is for an employer; on the farm, every stroke of the ax is for himself. If your country worker owns his farm or works on one that will eventually be his, his savings, over and above living expenses and paying for the farm, go towards raising the value of his land by improvement, equipment, careful and conservative cultivation. The average workman in the trades or in clerical positions feels that he has done well if he makes a living for a family and pays for a home worth from $2,000 to $5,000. The farmer works independently and confidently, with no greater labor because it is healthful labor, he accomplishes all the city worker does and pays for property worth four or five times as much; when paid for the property is not only a home but a means of livelihood. Many city workers break down from overwork or nervous strain and the earning capacity which alone feeds and clothes them is gone. Few farmers break down from overwork and if they are sick, the land is still there to provide living expenses. Farm work is often hard for women

VALUE $325.00

MAGNIFICENT PIANO

—AND—

$100.00 in Cash

GIVEN AWAY ABSOLUTELY FREE

FOR CORRECT ANSWERS IN THIS PUZZLE CONTEST.

1st PRIZE.— MAGNIFICENT UPRIGHT PIANO AND STOOL TO MATCH. VALUE $325.00.

Finest action and tone, beautiful hand polished Spanish mahogany case. Fit for the home of a King and the greatest prize ever offered in a contest of this kind. (It is on view any business day from 9 to 5 at our factory.)

2nd Prize	$25.00 cash
3rd Prize	$15.00 cash
4th Prize	$10.00 cash
5th to 9th, 5 Prizes of $5.00 each	$25.00 in cash
and 25 prizes of $1.00 each	$25.00 in cash
TOTAL CASH PRIZES	$100.00

THE PUZZLE.

GEPNINIW ORTONOT
NOTRAELM XFAILAH

The jumbled letters given above represent the names of 4 well-known Canadian Cities. To help you solve them we have underlined the first letter in each name.

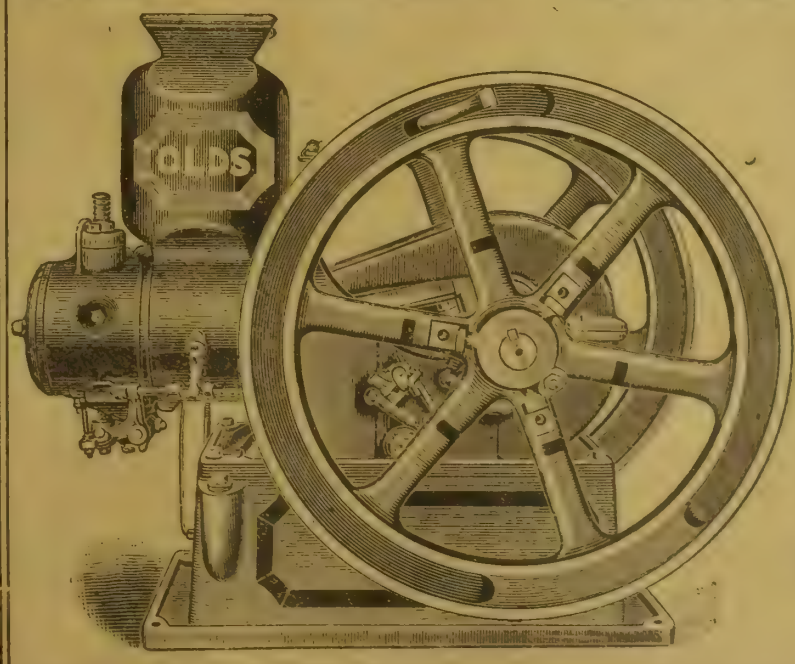
The first is Winnipeg, now guess the rest and send us in your solution of all four names in your very neatest and best handwriting.

CONDITIONS:

1. This contest is absolutely free. No one is asked to spend a cent to enter.
2. Children under 12 years of age will not be permitted to enter.
3. No employee of ours or relation of employee will be allowed to compete.
4. The prizes in the contest are awarded according to handwriting and general neatness. Be neat and you may win a good prize.
5. Judging will be done by three gentlemen having absolutely no connection with this firm. Their decision is to be accepted as final.
6. There is a simple condition to be fulfilled which we ask of all contestants. As soon as your answer is received we will write advising you if it is correct and telling you of this condition.

Address INTERNATIONAL MANUFACTURING COMPANY, Dept. 90 TORONTO, ONT.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

unless daughters are plenty and willing, but it is only hard as manual work, the nervous force, the motive power of one's life is conserved by the healthful peaceful life. Prison authorities have been experimenting recently with outdoor life as a cure for crime. The healthful work, the good food and the pleasant surroundings have been found an excellent thing. The criminals have given place to honest normal men. If it can cure a criminal surely it can keep a normal man strong and well and happy. It is the reasonable, sensible, comfortable way to live. It is nature's way of providing for the human race. Any normal man can earn his living; a man that knows how can earn ease and comfort and a competence.

Soups and Soup Making.

The richness or quality of soup depends more on a proper choice of ingredients and careful cooking of them than on the quantity of solid matter employed; more on the skill of the cook than on the amount spent.

Soup can be made of anything—fish, flesh, fowl or vegetables. In a household where soup is, as it ought to be, an article of daily food, the ordinary waste is reduced to vanishing point.

Scraps of meat of all kinds, bones, and other odds and ends, can be turned to account in soup-making. Many substances of which we cannot get the benefit by ordinary cooking are in this way made to yield their supply of nourishment, as in the case of gelatin which is contained in bones, and which can only be extracted by slow heat, such as is required to make soup.

Stock, as it is called, is the basis of all soup; but no better foundation can be had than the bones from roast beef or mutton.

Sometimes we put the bones on a gridiron over a clear fire for a few minutes before putting them on to boil, adding any scraps of the cold meat which we may have on hand, and a tablespoonful of rice, or two medium-sized potatoes cut in thin slices.

For the bones from a loin of beef or rib roast allow from 3 pints to 2 quarts of water (cold) and cover closely, boiling three or four hours. Half an hour before dinner remove all the bones and meat, adding boiling water to make the required quantity if it has boiled down. Salt to taste, add a small bunch of celery cut fine, cook 15 to 20 minutes, strain into a warm tureen, and serve as quickly as possible.

The flavor may be varied—a chopped carrot, an onion, or a little browned flour, or a quart of nice ripe tomatoes may be used instead of the celery.

A real vegetable soup may be made by adding two potatoes, an onion, 2 carrots, one quarter of a small cabbage, or a small head of cauliflower, all cut in small pieces, and put in the soup at least three-quarters of an hour before dinner, removing nothing but the bones and scraps of meat.

Three pounds of lean beef or mutton—part of each is better, and the cheapest pieces are good—will answer in place of the roast meat bones.

The bones and pieces from roast meat, especially if there is considerable fat, as in a loin of mutton, may be boiled in sufficient water for the soup, the day before it is to be served, strained and placed where it will cool slowly.

In the morning remove all the fat, and put the broth in a kettle or saucepan with rice or potatoes as in the former recipe; when it boils add salt to taste and any vegetables desired, chopped or cut fine; cook slowly for an hour and a half and serve.

This is a nice foundation for a tomato soup also, using a pint of canned tomatoes, instead of the celery or other vegetables, adding them an hour before the soup is done; strain the same as for celery soup, always using the rice and potatoes to thicken the soup, it being nicer than flour, a little of which, browned, is sometimes added to give flavor.

There are also a few general hints that it is well to keep in mind if you wish to make good soup. Put into the pot a quart of water for every pound of meat. Put the meat into cold water and let it cook very slowly. Skim the soup frequently.

If it is necessary to add water let it be boiling; the addition of cold water will spoil the soup. Keep the lid on as much as possible, for the strength of the soup evaporates with the steam. If there is any soup left, do not throw it away. Pour it into a dish and heat it up next day. Be careful, however, to remove the fat from the top before heating.

VEGETABLE SOUP.

Half a carrot, half a turnip, a small onion, green peas, a cauliflower, and a quart of good mutton broth. Cut the carrot, turnip and onion into dice, and allow them to simmer in mutton broth till tender. Cook a small cauliflower separately, drain it, and divide the flower into pieces; add to the broth, and then stir in a gill of green peas. Sprinkle in a teaspoonful of chopped parsley just before serving, and season well. Small chops of the neck may be cooked and served in the soup if liked.

Stewed Beef Kidney.

With this I sometimes serve rolls of bacon, or grilled tomatoes, or fried potato, as well as the toast. Either goes well with the kidney. Required:

One pound of beef kidney.

Two Spanish onions. One pint of stock.

One ounce of flour.

One ounce of dripping.

One tablespoonful of mushroom ketchup.

Seasoning. Toast.

Cut the kidney into pieces about the size of a small walnut, and be sure to remove any white portions, as these cannot be eaten.

Wash and dry the kidney, roll it in the flour, peel and chop the onion, fry it a light brown in the dripping. Add the kidney, stock, and a little seasoning.

Stir until just on boiling point, then simmer very gently for two hours or till tender.

Add a careful seasoning of salt and pepper, and the ketchup. Serve on a hot dish with sippets of toast round.

Care of the Hands.

A bottle of oxalic acid, kept on a high shelf, out of the way of the little folks, will be found most useful to remove stains gained by preparing vegetables or fruit, and its action may be accelerated by the use of a bit of pumice. After handling onions or fish, wash the hands, then rub them with a mixture of dry mustard and salt before drying them. Burns will leave no scar if they be dusted at once with baking soda—baking powder will do at a pinch—or with powdered charcoal. For scalds, powder with a mixture of bicarbonate of soda and subnitrate of bismuth in equal quantity. Should blisters rise, draw off the water by piercing them at the side, near the outer edge—never on top—with a coarse needle which has first been sterilized by being held in the flame of the gas or the red coals for an instant. The blistered skin will then drop back into place and if protected will act as a shield to the raw surface until a new skin is formed. If moist application be made to a scald or burns, a scar will result.

For slight cuts, apply a mixture of two parts of carbolic acid to one of glycerine, and if the wound be deep

INTERNATIONAL POULTRY FOOD
is a marvellous egg-producer. It often doubles the number of eggs—makes hens lay all winter—and gives you plenty of eggs when they are selling in the cities for 50c. to 60c. a dozen.
HENS LAY RIGHT IF FED RIGHT
The big men in the poultry business—those who are making big money—will tell you that INTERNATIONAL POULTRY FOOD cures Chicken Cholera—saves the little chicks—keeps the fowls strong and vigorous—and is matchless to fatten fowls for the market.

have a physician draw the edges together with a stitch or two. Do not suffer permanent disfigurement if you can help it, for it is an easy matter to keep a little store of these simple remedies in a medicine cabinet in kitchen or bathroom but it is not so easy to conceal an unsightly scar when one wants pretty white hands to conform with holiday attire.

Cosmetic gloves are excellent for keeping the hands in good condition, or for restoring their appearance if they have been neglected. They may be made from an old pair of well-washed chamois gloves or a well-cleaned pair of kid ones, the tips of the fingers being cut off and holes snipped in the palms and backs. They may be coated on the inside with some good cold cream or clarified mutton tallow, or the hands may be anointed with the grease and the gloves drawn on. A good bleaching medium to be used in connection with the gloves is made of two drams of sweet almond oil, one dram each of glycerine and rice flour, the yolk of one fresh egg, one ounce of rose water and thirty-six drops of simple tincture of benzoin. The egg is well beaten then the other ingredients are beaten into it, the rice flour being added last of all. Almost, if not quite, as efficacious is the clarified mutton tallow, which forms the basis of nearly all first-class cold creams. To prepare it, cover raw tallow with cold water and bring to a boil, then simmer until the fat is melted. Let stand until perfectly cold, when the clean, pure cake may be lifted from the top, melted again in a china bowl set over boiling water, and any preferred essential oil beaten into it, after which it is strained through cheesecloth. The grease not only keeps the nails from cracking and whitens and softens the hands, but does away with hangnails.

Always push back the cuticle from the finger nails, never cut it.

Plenty of Water.

You are desirous of having a clear complexion? It is not enough that you simply treat yourself externally. The complexion is the thermometer that tells by its sallowness that the liver is out of order; by the red spots upon it that the stomach needs attention; and by its dull, heavy look that the kidneys demand treatment. Water externally and internally makes woman good to look upon. Taken internally, it flushes several important organs and acts upon them as a rinser, carrying away all the poisonous matter that has so rapidly accumulated. Where your digestion is out of order a simple medicine recommended by a Southern mammy and found efficacious is a glass of hot water—not tepid, for that may cause sickness—in which pinch of fine table salt. It is possible that, just at first, when taken before breakfast, you may not care for this medicinal drink, and can only take one half of it; but you will get so that a gobletful of it is looked forward to with pleasure, while its effect is shown by the smoothness of the skin and the brightness of the eyes. If you find yourself growing very tired take a tepid bath into which plenty of rock salt has been thrown, and rub yourself dry with a coarse towel.

Reasons for Pruning.

To give proper form to the tree.

To remove all dead branches and limbs that cross each other.

To thin out the top, so that the tree can be readily sprayed, and the fruit easily picked.

Prune when the tree is dormant to increase wood growth and thus renovate the tree by inducing it to bud and new wood growth.

Great Clearance Sale
of used
Pianos, Organs and Gramophones

It's our Semi-Annual Clearance Sale of used Musical Instruments. Every Instrument has been thoroughly gone over in our own work shop, and has been put in first-class condition, cleaned and polished. These sales afford music lovers an unusual chance of securing a good Instrument at an extremely low price.

Here are some of the Bargains :

1 Columbia Gramophone,	Former Price	-	-	$ 35	now	$ 15

Curing Meat.

"For probably ten years we have been using a very satisfactory method of curing hams and shoulders, which can be used for sides as well," writes R. E. Rogers. "Until we discovered this method we went through the time-honored method of packing in a barrel of brine good, substantial stuff, which was strong enough for self-support. Now the brine barrel is dethroned at this house.

"We all have our regular ways of butchering, killing hogs, cleaning, handling, etc., which are really not so important, since the results of poor methods here last only till the butchering is done, while improper curing is evident as long as the meat lasts.

"As soon as the hams, shoulders and side pieces are cut up and cool we go at the sugar cure. This usually is two or three days after killing, owing to getting sausage and lard taken care of, and necessary other work and cleaning up after butchering is out of the way.

"The Sugar Cure.—Mix together 1 gallon clean salt, about 1 pint of brown sugar, and not over 1-2 cup of pepper. We use no saltpeter. Thoroughly mix these ingredients together, and apply by rubbing in by hand. Rub one-half of this mixture into every part of the meat possible, and rind side as well as the other parts where there is no rind. Better have the sugar, salt, and pepper in a dish or pan large enough to hold one shoulder or a ham at one time, and so put the meat into the sugar cure rather than the sugar cure on to the meat.

"After you have rubbed it in thoroughly place the meat in a clean, cool place, and leave for a week or more before applying the second or the last amount. It is better not to allow the hams and shoulders to freeze before applying this mixture. Some of our neighbors tried this way of curing except that they added saltpeter, and they did not like it. The reason, I believe, was due to the saltpeter, for since they have used the mixture as given above they like it, and find it a great advantage over the brine method. It takes some of us a long time to learn; for 20 years the brine barrel was as much a part of our housekeeping equipment as was a coal oil barrel.

"After letting the meat lie thus seasoning for several weeks, depending on whether frozen much or not, it is transferred to the smoke house, where its final curing is given."

Hygiene of the Mouth.

A great many of the bacteria that cause disease enter the body through the mouth. Germs are always to be found upon the gums. Those peculiar to the contagious diseases have been repeatedly discovered within the mouths and throats of healthy persons. Some of them persist for months in individuals who are not susceptible to infection; but if, from exposure, physical exhaustion, or other cause susceptibility is developed, the germs promptly produce illness.

There is also a group of diseases which affect only the mouth. The most dangerous of these are known as "ulcerative stomatitis" and "noma." The former generally begins at the junction of the lower gum and the teeth, and may destroy the tissues down to the bone. It is highly contagious. Noma begins on the inner surface of the cheek,and causes extensive destruction. Its progress is so rapid that it sometimes terminates fatally within a few days unless checked by vigorous treatment. It attacks delicate children or those who are recovering from an acute disease, particularly measles or diphtheria.

Fortunately it is comparatively rare, but the possibility of its occurrence indicates the importance of frequent cleansing of the mouth during illness.

The less serious class of mouth diseases includes several which, although not dangerous to life, are painful and may prove injurious, especially to children, by interfering with mastication and impairing nutrition. The simplest of them is characterised only by redness, with perhaps a few small ulcers on the tongue or lips. It often results from neglect of the teeth or the habit of introducing into the mouth such improper substances as pieces of wood or rubber, and in older persons from the use of tobacco. Although it is generally of short duration, it is sometimes followed by other more serious affections. The contagious mouth diseases are often communicated from child to child by the fingers or through the exchange of toys and pencils, or by the eating of fruit and confections in common.

Decay of the teeth is due to the action of bacteria which thrive upon the remnants of food that adhere to the gums and teeth after every meal unless removed with the brush.

The infectious diseases cannot be prevented with any degree of certainty solely by attention to the mouth, but those of a local nature rarely attack a mucous membrane that has received proper care.

The Man of Twenty-one.

To-day you are twenty-one. If life means anything to you, no doubt you feel you must shoulder greater responsibilities than ever before. You go forth now to make your way in the world, to rub elbows with your fellow men and to stand or fall in the business world.

You must choose your own place in life. By nature you are no doubt fitted for some special line of work, and you constantly find your inner nature calling you to enter upon its duties. Select the position in life for which you are best fitted and in the pursuit of which you will take pride and pleasure.

When your life's work is chosen and you have entered it, make it a rule to be perfectly square in all your dealings with mankind. "Honesty is the best policy" may be an old adage but it is nevertheless a true one.

Make up your mind to live a perfectly sober life. Intoxicants have unfitted thousands of men for the business life and finally become their utter ruin. It may sometimes be difficult to refuse when a very dear friend urges you to indulge, but it will pay you in dollars and cents as well as in manhood to resist.

As you no doubt come in touch with many young people, you must choose your associates. Let them be pure and high-minded. From these young people you will no doubt choose the girl who is to share life's joys and sorrows with you. Whatever you do, never trifle with a girl's affections. When you pay marked attention to a young lady, she has a right to think you want to be more than a mere friend. Do not turn from her to another "just for fun," or "to make her jealous." You will regret it when you are settled in life, whether marry her or the other girl, however happy your life may be.

Health by Alphabet.

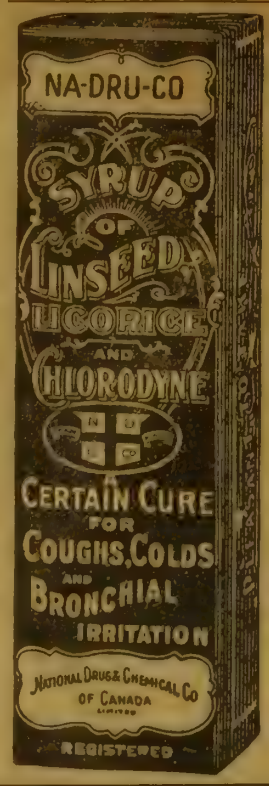
Some calm and collected person reminds us every little while, in the midst of a world of doctors' patients and devotees of health fads, that many of us have, like Liza, "only ourselves to blame" for our troubles. "How do you do it?" we ask hopefully of some ruddy individual known "never to have had a day's sickness" or such amazing record; upon which come dejecting references to ice-cold tubs, or some comfortless kind of meals. Here is something the ordinary woman may have more temptation to adopt, as there seem no such inhuman practices suggested—a "daily health alphabet," compiled bt The New Idea:

Abstain from intoxicating liquors.
Breathe good air.
Consume no more food than the body requires.
Drink pure water.
Exercise daily.
Find a congenial occupation.
Give the body frequent baths.
Have regular habits.
Insure good digestion by proper mastication.
Justify right living by living right.
Keep your head cool and your feet warm.
Learn to control your passions.
Make definite hours of sleep.
Never bolt your food.
Over-exercise is as bad as under-exercise.
Preserve an even temperament.
Question the benefit of too much medicine.
Remember, "an ounce of prevention is worth a pound of cure."
Sacrifice money, not health.
Temperance in all things.
Under no conditions allow the teeth to decay.
Vanish superstition.
Worry not at all.
X-tend the teachings of this alphabet to others.
Yield not to discouragement.
Zealously labor in the cause of health and gain everlasting reward.—Lorgnette.

What is a Lady?

A little while ago, an English paper offered a prize for the best definition of a lady. This is the answer that took the prize:

"To be a lady means, rightly, to be a gentlewoman who shows by her every word and action a sweet and gentle dignity, with a gracious charm of manner; a woman whose heart is pure and true, who is tender toward all suffering, who sympathizes with those in trouble and is ever ready to give that which costs her some effort and self-denial. A lady thinks no work derogatory, and no one is deemed too low to receive courtesy and kindness. She is pure and good in every detail of life, a true friend, and a 'ministering angel' in sorrow and in sickness."



NA-DRU-CO
SYRUP OF LINSEED LICORICE AND CHLORODYNE
CERTAIN CURE FOR COUGHS, COLDS AND BRONCHIAL IRRITATION
NATIONAL DRUG & CHEMICAL CO OF CANADA
REGISTERED

THE SAFE COUGH SYRUP.

Because coughs and colds are common property, and cough medicines are numerous and cheap, many people dose themselves with stuff which the family physician would justly and unsparingly condemn.

NA-DRU-CO Syrup of Linseed, Licorice and Chlorodyne

on the other hand, is a remedy which is compounded by expert chemists and approved by physicians. We will gladly send to your physician or druggist, on request, a list of its ingredients.

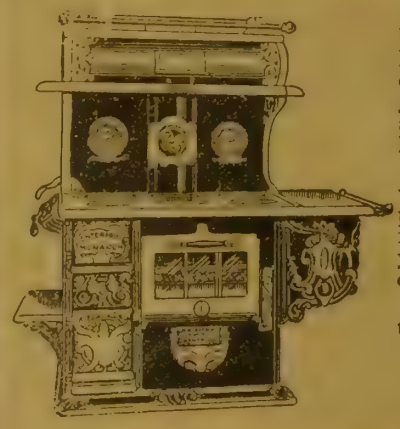
Na-Dru-Co Syrup of Linseed, Licorice and Chlorodyne gives immediate relief in cases of coughs, colds, bronchitis, loss of voice, pains in the chest, or any similar throat or lung troubles. Get a 25c. or 50c. bottle as a safeguard for this winter.

National Drug and Chemical Co. of Canada. Limited. 112

To Make the Farm Kitchen Comfortable

for the winter as far as heat is concerned, and comfortable also in the sense that there will be no friction on account of badly cooked meals, you should purchase an

Enterprise Monarch Steel Range



With it's heavy castings, large fire box for wood burning, improved labor saving devices and small fuel consumption for the work done, it is just the range every farmer as well as city man should install in his home.

Note the extra large reservoir which heats water to the boiling point in double quick time, so that for lots of hot water and a sure oven you can bank on the MONARCH every time.

Write us for circular giving illustrations and full particulars of

"The Range for Those Who Want the Best."

The Enterprise Foundry Co., Manufacturers. Sackville, N. B.

Compare the "BISSELL" with other disks

Thousands of Canadian Farmers have tested the "Bissell" Disk Harrow in the same field with other makes and found that the "Bissell" HAS THE GREATEST CAPACITY.

The plates on the "Bissell" Harrow are the correct shape. They cut, turn and pulverize the soil where others only scrape the ground and set it on edge. The "Bissell" does clean work where others make a poor job of it.

The "Bissell" Scrapers meet the plates chisel fashion and keep the plates clean. Movable Clod Irons—an exclusive feature — keep the space between the plates clear.

The "Bissell" stays RIGHT DOWN TO ITS WORK. It won't bind, buckle or hump in the centre no matter how stiff or hard the soil may be. It is built to stand hard usage. The simple method of balancing the driver's weight removes neck weight. It is the Harrow you should know more about.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

FLORICULTURE.

N. W. A., St. Stephen, N. B., wishes to know: What ferns would be the most suitable for the centre of a dining room table? There is no gas in the house and hot water is used for heating. What size plants should be purchased and how many for a pan eight inches across?

Ans.—Use Pteria Tumula or P. Magnifica for fine ferns, Whitmani or Boston for coarse foliage. The number required depends on size of stock purchased. I like to use two and one-half inch pot plants putting four plants to a pot. This arrangement makes a nice looking pan from the start and leaves room for steady growth. A ball of roots of this size will go into any ordinary jardiniere without tearing the roots apart as one often has to do with a four or five inch pot plant. After planting the ferns they should be thoroughly soaked before placing on the table. Never allow the soil to become dry and spray the foliage, at least, twice a week. Do not allow the steam from hot dishes to come in contact with the foliage.

A Flower Lover, St. John, writes: Would you please tell me how to grow a pot of Spirea for Easter? I have a lot of the common sort growing in the garden. It blooms every Spring. Would their roots answer for pot planting? Is it too late to pot a few roots now being they are frozen?

Ans.—The garden Spirea makes a very pretty plant and should be potted at once. Dig up the amount of roots you want and thaw them out so they will go in seven inch pots. Then place the pots in a cool room that is well lighted but without direct sunshine. When the sprouts are about two inches high, water thoroughly and place the pots in a warm well lighted position. Such plants, if carefully watered, should bloom at Easter. Spray the foliage occasionally to keep off the red spider. See that the drainage is good and never allow the roots to dry out.

Speaking of bulbs for winter flowering, what can be obtained to give so much fragrant bloom during the winter months with so little trouble as the planting of Roman Hyacinths, Paper White Narcissus, Freesias, Dutch Hyacinths and Golden Spur Narcissus in the order named? These plants will give a succession of bloom from December until March, with very little trouble or expense.

Now is the time to cover hardy perennials like Phlox, Paeonies and Iris. These plants should be transplanted early enough, so they can get new roots before the ground closed. Your tubers and bulbs should be put in boxes or barrels and set away in a cool dry cellar where they will not freeze or dry out. Keep them as dry as possible so they will not rot.

I Present to You a "Health Belt Man"

He is 55 Years "Young"

Yes, 55 years young; not 55 old for My Health Belt poured vitality into his blood, nerves and tissues until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerve and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition

and a new view of life, with full self confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it does not do the work.

These Wonder Books are FREE

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont. will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child. the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Storage of Damp Grain.

In sections of the country where grain is in the shock, and has become wet from rains and threshing is done from the field, no doubt much of the grain will go into the bins very damp. The farmer as well as the thresher is anxious to conclude his job as soon as possible, hence the work is often pushed regardless of damp grain.

In many localities where the threshing crew is composed very largely of men from a distance, they become restless and it is a somewhat difficult matter to keep them when they cannot work more than two or three days out of each week because of wet weather. In many instances during the threshing season the machines have been deserted by their crews and the men returned to their homes because of continued rains which kept them idle for days and weeks.

It is a serious mistake to thresh grain when wet or even damp, because the proposition of making it marketable is always expensive and is frequently the cause of serious loss. The farmer who is compelled from any cause to thresh his grain when wet should lose no time in taking immediate care of the same, otherwise it may damage or spoil before he is aware of it.

A few dry bricks thrown into the grain as it is put into the bins will absorb large quantities of moisture. Sticks of very dry stove wood will answer the same purpose. A dry cedar post or sticks of cordwood from poplar or pine trees will absorb their weight in moisture from a bin of damp grain. This has been thoroughly demonstrated on several occasions when damp or wet grain was being stored. Burlap or jute sacks filled with dry chaff when buried in a bin of damp grain will absorb moisture readily and also provide space for air in the same.

The simple and inexpensive methods of protecting wet grains, such as I have mentioned above, are practical and are much more desirable than shoveling it over and over day after day as many farmers have done in order to keep it from heating.

Grain that has been allowed to get warm or hot in the stack or bin is worthless for feed. Musty wheat is no good for flour and should not be sold or used for that purpose.—W. H. Underwood.

Free Interchange of Standard-Breds.

The interchange of breeding stock between Canadian and American breeders of trotters is facilitated by a government order providing for the free importation of Standard-breds from Canada for breeding purposes. The United States Department of Agriculture has adopted a rule recognizing the Canadian National Records for Standard-bred horses, subject to the same provisions as prescribed for books of record across the seas. It is stipulated that no horse registered in the Canadian records for Standard-bred horses shall be certified by our Secretary of Agriculture as pure-bred, except those wnicn trace in all crosses to registered horses in the United States, where the breed originated.—Breeders' Gazette.

Agricultural Society Work in Newfoundland.

Editor Maritime Farmer:—

The St. Johns' Agricultural Society is "up and doing," importing and supplying to farmers Cattle Feeds, Fertilizers, Seeds, and Machinery, of the best guaranteed quality obtainable in Canada, at greatly reduced prices; and new lambs, calves, swine, and other animals of pedigree stock for registration in the countryf

Its efforts are also being directed towards the advancement of the

Learn why PURITY FLOUR is unlike any other brand

PURITY FLOUR is unlike any other brand of flour. No two milling companies follow exactly the same process of milling. In fact, no two different brands of flour in the world are exactly alike in quality.

And here is another fact worth knowing: Every wheat berry contains both high-grade and low-grade portions.

The process of milling PURITY flour costs more than to mill ordinary flour. The low-grade portions are separated and excluded. PURITY is an ALL HIGH-GRADE, hard wheat flour. It has greater strength, greater absorption and greater expansion. It is a thirstier, more elastic flour. It drinks more water and expands into more loaves.

Use PURITY FLOUR for your next batch of bread. Count the loaves. You'll find you have made "MORE BREAD AND BETTER BREAD" from PURITY than when you've used an equal weight of weaker and cheaper flour.

WESTERN CANADA FLOUR MILLS COMPANY Purity MANITOBA HARD WHEAT

PURITY FLOUR

"More bread and better bread"

IMAGINE, if you can, how much whiter, and more toothsome, and more nutritious, the bread made from such a HIGH-GRADE flour must be.

And can you imagine yourself enjoying the flaky pie-crust and the light, delicate cake? —your reward for using PURITY flour

When making pastry, please remember to add more shortening than required with ordinary flour—for on account of its extra strength, PURITY FLOUR requires more shortening for best pastry-results

Yes, PURITY FLOUR costs slightly more than ordinary flour. But use it once and you'll say it's worth more—much more—than the difference.

Add PURITY FLOUR to your grocery list right now.

PARSONS' PILLS *tone the system.*

Lumber used by Agricultural Implement and Vehicle Manufacturers in Canada, 1910.

Statistics of the lumber used have been received from 162 companies, consisting of the Agricultural Implement and Vehicle Manufacturers of Canada in six provinces, by the Forestry Branch of the Department of the Interior. 76,474,000 feet of lumber were used worth $2,513,265, or an average cost of $32.86 per thousand. Ontario used nearly 90 per cent. of the total for the Dominion; Quebec purchased 6 per cent.; Manitoba 4 per cent. and Nova Scotia, New Brunswick and Prince Edward Island used very small amounts. Woods used in these industries require strength and durability which is shown by the large amount of Maple, Elm, Oak, Birch and Hickory that were used. Of the native woods, cherry was the most expensive at $104.00 per thousand, and Ironwood the cheapest at $15.00 per thousand. Mahogany at $120.00 per thousand, was the most expensive of imported woods.

The species of woods having the technical qualities required by these industries at present grow only in small quantities in the agricultural and farming districts of Canada. For this reason the supply is rapidly becoming diminished so that unless steps are taken to reforest or conserve the production, we must depend more and more for our supply, on the United States. The fact that the woods necessary for the proper building of agricultural implements cannot be secured in any quantity in Canada tends to increase the cost of manufacturing in Canada.

One Line Pulling.

(Continued from page 154).

your whip upon the other side," "Take off the blinds," Even up the bridle—one cheek piece is too high," "Your over check hurts the top of his head," "Examine his eye—there is some defect in vision," "Get after the windows in the barn and don't let him suffer from light in his eye when standing," "Don't hitch one side to the house when you tie up—change him round occasionally." These are a few of the many good hints that I got from the doctors, and I am free to say that I learned much from the advice so kindly given.

Old "fox hunter" had two very sharp molars. The edges kept his cheek very sore. I was ashamed of myself when I looked through the speculum at that poor bruised cheek. To be sure, I had let a so-called "floater" float them some time before, but I had neglected the duty of being present and looking after them myself.—Dr. R. H. Wood.

Canada's Lumber Production—Softwoods.

Interesting statistical comparisons may be made from the 1910 lumber report prepared by the Dominion Forestry Department. Of the twenty-six native species of wood which together were cut in 1910 to the extent of four billion, nine hundred million board feet worth over seventy-seven million dollars, the first nine were coniferous or softwoods. Spruce was the most important, alone forming over one-quarter of the total cut. Spruce and white pine together formed barely one half of the 1910 cut, while in the year previous, these two species made up nearly three fifths of the total. This decrease in proportion is due not to a smaller cut of the two species, but to a very great increase in the amount of Douglas fir, hemlock, cedar and yellow pine produced in British Columbia. One-quarter of the 1909 cut was formed of these four species, while in 1910 the total cut of the four was increased by seventy percent.

White pine lumber is undergoing a gradual evolution in its importance to the lumber industry. Up to three years ago, white pine stood at the top of the list when it was supplanted by spruce, although the actual cut of the former had not decreased. The prediction of last year that white pine had nearly reached its maximum cut has proven true this year, the 1909 cut being decreased by four percent., or forty-two million feet. Yellow pine, increased in its cut nearly six hundred percent. in British Columbia during one year. This increase of over one hundred and fifty million feet was sufficient to raise it from fourteenth place in the species table to sixth place in importance, thus surpassing in one year, red pine, larch, balsam, and the four most important hardwoods.

Building Big Fertilizer Plant at St. Stephen.

To meet the increasing demand from the farmers and fruit growers of New Brunswick, Nova Scotia, and Quebec for high-grade commercial fertilizers, a 10,000-ton plant is being completed by U. S. interests at St. Stephen, N. B.

In planning the factory provision has been made for increasing its capacity to 20,000 tons annually. The plant is 90 by 252 feet, equipped with up-to-date machinery for the manufacture of fertilizers according to the most advanced ideas. A cooperage will also be operated by the company

Located at tide-water, the St Stephen plant will have the advantage of receiving raw materials by direct shipment—potash from Germany nitrates from Chili, and acid phosphate from southern States ports. Little or none of the ingredients of fertilizers except fish-scrap are produced in Canada.

As a distributing center St. Stephen has the advantage of location on the lines of the Canadian Pacific, and of water transportation to many points. Fertilizers from the States pay a duty on the average of $3.30 per ton, and must be ordered far in advance with great uncertainty as to deliveries and the condition in which the goods will be received. A thoroughly modern plant of large capacity, favorably located, will give the fertilizer consumers of this district far better service than was possible heretofore.

Preserving Fruit for Exhibition.

It is often desirable to preserve fruit in the natural state so that it may be kept for several months, retaining color and shape. The use of formaldehyde is one of the best methods of preserving fruits for exhibition at state and country fairs which usually come several weeks after fruit is ripe. In the first place the fruit should be ripe and well colored when gathered, but should not be soft or have defective spots. For apples, peaches and pears, take 95 parts pure cistern water and add to this five parts of formaldehyde; stir this a little and do not leave it exposed since formaldehyde evaporates quickly when exposed to the air. Place the fruit in a jar and pour the preparation over it and seal tight. For grapes use 98 parts water and two parts formaldehyde. These formulas will usually give satisfaction, but when the fruit is exceedingly acid a teaspoonful of soda to a quart jar will aid in holding the color.

Formaldehyde is known commercially as 40 per cent. solution of formalin and may be so ordered from any druggist or supply house through the local dealer. Exhibition jars are not so readily obtainable, but the common Mason fruit jar will answer the purpose very well.—H. F. Grinstead.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Don't take risks with new or untried brands of paint. There's a 40-year record of satisfaction behind Sherwin-Williams Paint, Prepared, which makes it a safe investment for the most careful buyer. For 40 years every effort has been made to make SWP the best paint money can buy. Ask the local Sherwin-Williams Agent.

THE SHERWIN-WILLIAMS CO. of Canada, Limited, Montreal, Toronto, Winnipeg, Vancouver

Do You Shave Yourself?

If so, you no doubt have shaving troubles, as there isn't one man in fifty who knows how to strop his razor correctly, the almost invariable result is a rounded edge instead of a keen, sharp edge so necessary to a clean satisfactory shave.

MAIL ORDERS FILLED

BRANDT'S AUTOMATIC RAZOR STROPPER

"Makes every man an Expert." Does what no human hand can do.

It automatically sharpens the ordinary old style razor any size or make, and all kinds of safety razor blades including the Gillette, Ever-Ready, Durham-Duplex, Keen-Kutter, Enders, etc. It sharpens them better than the most expert barber can do it. In using the Brandt Automatic Stropper, you do not hold the razor while stropping. You cannot round your edge or cut your strop. The Brandt Automatic Stropper strops the razor for you. It requires no skill or experience. We invite any man who shaves himself to call at our store, and examine this celebrated stropper, and see how it does away with all stropping troubles.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharge, Ulceration Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.

I want to send you a complete 10 days treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost, my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. How to Handle Damp Sheaves.

Taking up the subject of "Seed Germination," and treating more particularly, the handling of grain in in the stook, Mr. J. Ball, of Rexboro Alberta, in the issue of The Homestead for March 1st, last, gives some very timely suggestions that are well worthy of reproduction and will apply to the handling of damp sheaves. Mr. Ball says in part:

No matter if the stooks do not contain more than ten or twelve sheaves if they are simply reared up and left unhooded, they are placed in a position in which they will take considerable harm from a fall of rain. Of course, it is better not to throw a large number of sheaves together into one stook; and then again, stooks should never be built in a circular form, as the sheaves in the centre, when once thoroughly damped, are in such a position that they dry out very slowly indeed.

Let us for a few moments consider what will take place where grain is simply left reared up, with the heads unprotected, should a heavy fall of rain take place. The heads being tightly packed together in the sheaf, the glumes or chaffs act as a cup, holding the water to the grain, which is thus literally soaked, and largely owing to the length of time it remains damp, it becomes very much discolored. In looking through samples of grain, harvested here, these discolored kernels can readily be distinguished from the rest.

Having for a good many years been accustomed to harvesting grain in a wet climate, I have found that the only way to secure a bright sample, free from discoloration, is to proceed as follows. Rear up eight sheaves in a double row—four at a side—giving the sheaves sufficient spar or slope that they will prop or support each other. This double row of sheaves should be so placed that the ends point to the north-west and south-east, as we generally get our strongest winds from the north-west. The stooks being thus placed end to the wind, not only offer the least resistance to the on-rush of the blast, but the wind rushes through the aperature formed by the straddling of the sheaves, and thus dries out the grain both on the inside and outside of the stook.

Having got the eight standing sheaves placed in position, the workman should then place a sheaf across his right thigh in such a position that the heads are before him and the butt or stubble end under his right arm. He then opens out the sheaf, right up to the band, in such a way as to cause the heads to describe a half-circle; and lifting this on to the southeast end of the standing sheaves, he fixes it firmly on, butt-end up, and with the heads hanging down all around so as to thatch four of the eight standing sheaves. He then opens out another sheaf in like manner, placing it so as to thatch the other four standing sheaves, and the operation is finished by giving the two butt-ends of the hooding sheaves, which are sticking up, a smart whack with both arms, so as to drive them close together. The hooding-sheaf at the southeast end should always be placed in position first, as, should a strong north-west wind blow, the north-westerly hooding sheaf, being placed in position last, will help it to maintain its position.

Stooks built in this manner will defy the heaviest fall of rain, as the hooding sheaves, acting like thatch will shoot off the water. Indeed the only grain that comes in contact with the rain, at all, is the grain in the two hooding sheaves; and, as these are inverted, the glumes or chaffs protect the grain, shooting off the water instead of holding it like a cup, as they would have done with the heads unprotected.

AFTER DRUGS FAIL---
I'LL CURE YOU!

Go try them all; drugs, dope, patent nostrums and doctor's concoctions, and after you have found by experience that none of them will help you, then come to me and I'll cure you. Nature's way.

I've quit asking people to come to me first; to do so would save them many a dollar and lots of useless suffering, but experience is the best teacher, and the only thing that will really convince a skeptical mind.

I used to prescribe drugs for my patients, just as much as any other doctor. I knew I was deceiving them when I told them I could cure them with drugs. That's why I quit. The time is near when doctors who use drugs will have to abandon that system of treatment for the natural treatment, electricity.

Why, there's Prof. Osler, a world-famed scientist, who said recently that most drugs are worthless.

Dr. Albert Leffingwell, of the American Humane Association, says that the average length of human life would not be diminished by an hour if all the drugs of Christendom were dumped into the sea—barring, perhaps, half a dozen.

How does electricity cure, you ask. By helping Nature. Nature will cure you if she has the power. Electricity is that power. Understand that your machinery is run by electricity. The stomach, heart, liver, kidneys and digestive apparatus are run by electric energy, which is created by the digestion of food in the stomach. Most sickness and chronic disorders can be traced to the failure or breaking down of one of these organs. The reason any part fails to do its work is because its supply of electricity is insufficient. Restore that force and pain and sickness will disappear.

Electricity is nerve-food—nerve-life. It makes vigorous men out of weaklings.

I have the only successful method of applying electricity. It has taken me twenty years to perfect my appliance, and I know what I can do.

My Electric Belt is worn while you sleep. Just put it on and turn on the current. There is no shock or burn; the only sensation is a soothing glow.

I have testimonials from people all over the Dominion, who have found health in my treatment. You won't believe these letters, but they are bona fide.

M. F. McLaughlin:—

Dear Sir,—I have worn your Electric Belt for about three months now, and must say that it has done wonders for me. I have had doctor after doctor, and they have failed to do me any good whatever. Therefore, I must say, that I cannot recommend your Belt too highly, and I intend, that wherever I may go, or whoever I may come in contact with, to recommend it as a sure cure.—Herman O. Cook, Yarmouth, N.S.

Mr. Thos. C. Morton, 75 Cameron St., Windsor, Ont., says:—"Before I used your Belt, three or four years ago, I was unable to walk, but it improved me so much that I had no difficulty to walk after using it for some time, and my advice to all sufferers is to use one of your Electric Belts. No Doctors; no drugs, just one solid comfort. I hope your good work will be kept up."

The confidence I have in the wonderful curative powers of my Belt allows me to offer any man or woman who can give me reasonable security the use of the Belt at my risk ,and they can

PAY WHEN CURED

Electricity is a lot cheaper than a course of drugging, besides it cures where drugs don't.

Call or send for my free book, read it over, and then use your own judgment.

I GIVE IT FREE

Get my 84-page book, describing my treatment, and with illustrations of fully developed men and women, showing how it is applied.

This book tells in plain language many things you want to know, and gives a lot of good, wholesome advice for men.

Name .....

Address .....

As far as stacking is concerned, I would begin by rearing a double row of sheaves in a straight line, the length I wanted to build my stack, and then keep on building sheaves round these, heads up and butts to the ground, until I had got the stack as long and as wide as I wanted; and, right from the ground upwards would keep it so that the centre or crown of the stack was considerably the highest, so that there would be no danger of water finding its way to the grain.

If, however, the grain has been stacked in soft condition, it matters not however, scientifically the stack may have been built, the result will be disappointing; as the moisture in the sheaves will induce fermentation, which will quickly destroy the germ of the grain.

Special care should be taken to see that barley is well hooded in the stook, as the awns, where unprotected, hold a large amount of moisture and even the smallest amount of discoloration, whether the result of weathering in the stook or of fermentation in the stack will unfit a sample for malting purposes.

In opening out sheaves for hooding, it will be found that sheaves tied by the self-binder are tied too near the heads to make good hooding sheaves. To obviate this difficulty, my practice was to go eight rounds with the binder, tying the sheaves, as usual, pretty close to the heads; and then slide the binding platform so as to cause the machine to tie nearer to the butt-end , going two rounds with the binding table in this position. This arrangement gave eight sheaves tied as usual, for standing sheaves, and two tied nearer the butt for hooding-sheaves.—J. Ball.

Durability of Posts.

The Ohio Agricultural Experiment station has published a bulletin on the relative durability of post timbers. The need for investigation in this direction is clear. There is a great variety of opinion as to the best kinds of timbers for posts, whether they should be set green or well seasoned, and whether the top or the big end of a post should be placed in the ground. Men of practical experience are not agreed in any one particular. The bulletin referred to gives the results of examination of 292 fences, containing 30,160 posts. The fences were located in five States, and covered a great variety of local conditions.

The facts brought out by the investigation may be summarized as follows:

1. That a large post usually lasts longer than a small one of the same wood.

2. That there is no difference which end is put in the ground, except that the sounder or larger end should have the preference.

3. In a stiff clay soil, the posts rot principally just beneath the top of the ground, and in a porous, sandy or gravelly soil they usually rot from the top of the soil all the way down; the effect is the same in both cases.

4. In soil that is full of water all the time, posts will last longer. It is the alternating between wet and dry that causes decay.

5. From data collected so far, seasoning does not seem to have any marked effect on durability. The best catalpa fence examined was set green. In the best oak fence examined, the posts were cut and put in the ground the same day. Likewise some of the best fences are those in which the posts were well seasoned.

It has been very difficult to get accurate data on the matter of seasoning, especially in fences where the posts have been only partially season posts have been only partially seasoned when set. But there has been a sufficient number found in which the posts when set were well seasoned or entirely green to justify the above conclusion.

6. Timber that grows rapidly and in the open is not as good as the same variety that grows in the woods. This has been observed, especially in the red cedar, the catalpa, and the locust.

7. There is some evidence that it is not a good time to cut posts just as the tree begins to grow in early spring. This was noticed especially in catalpa fences, and to some extent in a number of others.

8. The wood at the centre of the tree is not as good as that just inside the sap wood. This characteristic is very common with nearly all the varieties of timber examined, especially so with the locust, the white cedar, the hardy catalpa and the oaks.

condition of the wood fiber of a post is a very important item in its ability to endure in the soil. In an average lot of so-called first class posts on the market, usually a number can be selected that are defective, though they may appear sound and firm. The quality of posts is usually somewhat darker than the usual color, esoecially near the centre of the tree.

Editor's Note:—

We would like to get the experience of some of our readers on this question.

Home Made Vinegar.

In response to numerous inquiries regarding the various processes involved in the home manufacture of vinegar and the precautions which should be taken in order to secure good results, Prof. C. I. Lewis, of the horticulture department of the Oregon Agricultural college at Coravallis has issued the following statement for the assistance of all those desiring to make vinegar on their own farms:

There are three distinct steps involved: (1) apple juice sugar, (2) alcohol, and (3) acetic acid: The amount of apple juice and quality depend on the grade of apples, their ripeness, variety and freedom from dirt. To make good cider vinegar ripe apples which are free from filth should be used, and the juice should be put into good, clean barrels.

In grinding and pressing the apples, care should be taken to observe the ordinary precautions for cleanliness. In some cases water should be added to the apple pumace after pressing, and then, after it has been allowed to stand a while, pressed again. In this way an additional amount of juice is obtained. This, however, does not contain enough sugar to make good vinegar. If high-grade vinegar is desired, the pumace should not be washed.

Where it is possible to do so, the juice should be put into one large vat or covered receptacle and allowed to stand a few days before putting it into barrels. In this way the solid matter will settle gradually before it is placed in the casks. The casks ld be thoroughly cleaned, treated with live steam or boiling water, to be certain that there is no foreign matter in them. Barrels should not be filled over two-thirds full of juice, and the bungs should be left out. A loose plug or cotton may be placed over the hole, however, to decrease the evaporation and prevent dirt getting in. The bungs should never be gut in until after the vinegar is made.

After the juice is placed in the cellar, the temperature should not be allowed to fall below 44 or 50 degrees Fahrenheit. The alcoholic fermentation will be complete in three to six months time. By raising the temperature the fermentation may be made more rapid, but it should not be pushed over 75 degrees. By adding yeast, fermentation can be completed in three months' time or even in less. It takes one yeast cake to about every five gallons of apple juice. The yeast cake should be dissolved in warm water before putting it into the juice. Vinegar or "mother" should never be added to fresh apple juice, or until after the cider has become hard.

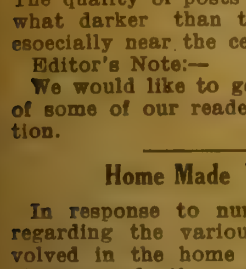
After thorough alcoholic fermentation has taken place, and the cider has become hard, the clear liquid can then be drawn off and after the cask has been thoroughly rinsed, the liquid can be returned to it. After filling the barrel about half full of the clear liquid, one-fourth of the old vinegar may be added, and on the surface of it some "mother" may be added if desired.

It requires from three to eighteen months or more to make good vinegar, according to the conditions under which the fermentation is carried on. When the apple juice is stored in a cellar and allowed to become vinegar to legal standard, it takes from twenty-one to twenty-four months. If the alcoholic fermentation is hastened by the use of yeast, and the acetic fermentation favored by a warmer temperatuee, and a vinegar "starter" added, it is possible to make good vinegar in six to twelve months.

When the acetic fermentation will produce about 4.5 or 5 per cent. of acetic acid, then the barrels can be filled to th?ir capacity and tightly corked.

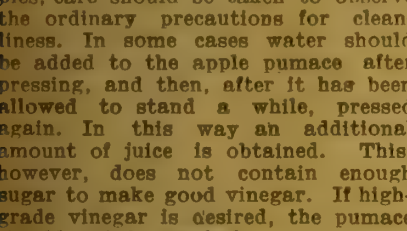
In manufacturing plants they use the "mother," or thick, tough, yellowish skin which forms in the vinegar barrel, and after adding it to the apple juice, let it drip over beech shavings, coming in contact with warm air in the process, which profilled to their capacity and tightly

Even when a man grows all the feed for his stock and its cost to him is nil it is not good business to feed it to cows that are not working at a profit.



ALL teas may look alike to you—but the difference in Red Rose Tea is in the taste and the smell. Another marked difference is the agreeable strength that puts real quality in the cup with less tea in the pot. Will you try it.

99



Business of Herdsman.

The work of a herdsman in charge of the costly herds in such aggregations of stock as that of the International Live Stock Exposition in Chicago has been put on such high plane that it has become one of the best paid jobs in out of the city work.

Only the men who own such herds know how important it is to have an accomplished herdsman in charge of his stock. This care not only covers the farm, but the road to and from the shows, and in the arena where judging is under way.

A large per cent. of the herdsmen in charge of American herds are foreigners. They hail largely from Ireland, Scotland, England and the Netherlands. Some of these men in their native country were early taught to make the best possible use of every ounce of feed assigned to the upkeep of the animals. Most of them had no such liberal approriations of feed stuff as that provided by the American dairy and beef stock farmers, so that most of them engaged in the work in this country with some exceedingly economical ideas in taking care of a herd of high bred cattle.

9. The quality of the wood or the

How Much Does it Cost By the Year?

The first price of a cream separator is no basis for figuring its cost. Suppose you paid $2 for a pair of shoes which, with $1.00 worth of repairs, lasted 12 months, making an average monthly cost of 25 cents. At another time, you paid $3 at the start, only 50 cents for repairs, and the shoes lasted 24 months—an average cost of less than 15 cents per month. Which was the better buy?

The same principle holds good in cream separator buying. You may pay a low price at the start—but such a separator will need frequent repairing—and won't last. The cost per year will be double that of a good separator.

I H C Cream Harvesters
Dairymaid and Bluebell

are famous for their durability. They skim close and run easy for years. They are built for long, hard, steady service. Here are some of their advantages:

Milk and dust-proof gears which are easily accessible—a feature found on no other separators; a patented dirt-arrester which removes the finest particles of dirt before the milk is separated; frame entirely protected from wear by phosphor bronze bushings; large shafts, bushings, and bearings.

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes. Let the I H C local agent tell you all the facts, or, if you prefer, write nearest branch house for catalogues and any special information you desire.

I H C Service Bureau

The Bureau is a clearing house for agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

TENDER CARE OF FINE ANIMALS

Then the herdsman must keep track not only of the herd, but of the individual cow, especially when the latter is engaged in making a record. On such occasion the herdsman is as particular about the feed of a cow as a doctor is in directing the diet of a patient. Of course the owner of the herd directs his man what to feed, but there is a deal in faithfully carrying out the orders.

When an animal or part of the herd is in the ring the herdsman constantly is on the watch to see that an animal stands in the most effective position. Almost constantly he is touching a hoof with his own toe in an effort to secure a better showing of an animal on all fours.

When a herd is on exhibition the head herdsman leaves the animals scarcely long enough to get his meals. He sleeps on a cot close by, and if an animal shows some sign of indisposition, the attention of the herdsman is as close as that of the trained nurse to a human patient. The most scrupulous care is taken in the matter of blanketing and in guarding against the herd sleeping in drafts.

The wages of a herdsman ranges all the way from $45 to $75 a month and even more, according to the size and character of the herd. The board and lodging of a herdsman is furnished in addition to his wages.

In late years a great deal of progress is made in rendering show animals tractable. They are handled with consummate skill in many places and under conditions capable of producing a stampede. There have been instances in which a good herdsman has accomplished the entire subjugation of an animal predisposed toward viciousness.

As to Fall Grazing.

The least growth of grass in the pasture will tempt many farmers to turn their cows onto it, and in many regions the regreened meadows will be fall-grazed. This policy is a wrong one, because, first, the new growth of one or two weeks can not make nutritious grazing, and, second, the cows will injure the sod and put the rootage into shape to do only poorly next year, even with an average of very good rainfall. Furthermore, the pasturage, at best, can be available for but a short time, and to turn the milk cows from dry rations to the green, small, thin and watery grass will result in disturbing their digestion and their milk flow for several weeks.

The experiment stations are warning the dairymen against overdoing the fall-grazing of the weakened pastures. Only where grass is well developed is it advisable to turn the stock onto it. Last fall many farmers disregarded the advice to fall-graze lightly or not at all, and they damaged their pastures badly. Those who fall-grazed their meadows ever so lightly now understand that they put their grass rootage into shape to make it suffer more seriously from this year's drouth. The dollar seemingly gained by grazing the revived grass down to the roots this fall will be lost probably with two or three other dollars next spring and summer.

A Des Moines man had an attack of muscular rheumatism in his shoulder. A friend advised him to go to Hot Springs. That meant an expense of $150.00 or more. He sought for a quicker and cheaper way to cure it and found it in Chamberlain's Liniment. Three days after the first application of this Liniment he was well. For sale by all dealers.

Field Crops of Canada.

A bulletin on the field crops ofCanada issued from Ottawa on September 14th, gives their average condition by provinces at the end of August, together with estimates of the production of spring wheat, oats and barley at that time. The per cent. condition of wheat is given as 86.80, of oats 84.44 and of barley 84.73, which is about five to seven per cent. higher than last year and nearly the same as two years ago. The other crops range in condition from 80 to 86 per cent. and are generally somewhat lower than in 1909 and 1910. The rains of August hindered the ripening of grain and some injury was caused by hail storms, low temperature and rust. Towards the end of the month frosts prevailed in many sections of the Northwest provinces, the full extent of which could not be determined at the date of the reports, but in the case of wheat, oats and barley production was lowered by probably 12 per cent., which has been followed in the table. In the older provinces the grains ripened earlier and little damage was sustained excepting from drouth in some localities, and the reported condition was 75 or over.

The average yield of spring wheat is estimated at 19.14 bushels per acre for the Dominion, which is seven bushels more than last year, and the total yield at 186,928,000 bushels. The fall wheat was reported last month at 17,706,000 bushels, being grown almost wholly in Ontario and Alberta. The total wheat yield of the country is therefore estimated to be 204,634,000 bushels or 81,849,000 bushels more than last year at the same date. The average per acre is 19.50 bushels, or 6.30 bushels per acre more than last year.

For the Dominion the yield of oats is given as 368,153,000 bushels, which is 83,906,000 bushels more than last year's estimate at the same date, and the average at 35.81 bushels per acre, being more than last year by 7.10 bushels. The average for barley is also higher than last year by 7.31 bushels, and the total yield is estimated at 51,559,000 bushels as against 39,388,000 bushels for last year.

The estimated yield of spring wheat for Manitoba, Saskatchewan and Alberta this year is 181,535,000 bushels, of fall wheat 3,193,000 bushels, of oats 204,758,000 bushels and of barley 30,205,000 bushels, as compared with 98,808,000 bushels spring wheat, 1,082,000 bushels fall wheat, 92,201,000 bushels oats and 14,723,000 bushels barley in the previous year.

In Prince Edward Island, Nova Scotia and New Brunswick the estimated yield of spring wheat is 1,453,000 bushels, of oats 16,699,000 bushels and of barley 437,000 bushels; in Quebec 1,777,000 bushels spring wheat, 44,619,000 bushels oats and 2,389,000 bushels barley; and in Ontario 2,163,000 bushels spring wheat, 14,513,000 bushels fall wheat, 102,077,000 bushels oats and 18,528,000 bushels barley.

The final estimates of last year printed in the December Monthly gave the production for the whole country as 16,610,000 bushels fall wheat, 133,379,600 bushels spring wheat, 323,449,000 bushels oats and 45,147,600 bushels barley.

The October number of the Census Monthly will give the statistics of the areas of field crops of the Dominion this year as taken by the Census of the first of June.

THE SARNIA FENCE CO.
SARNIA, ONT.

ROYAL FARM FENCING

MODERN METHODS IN MANUFACTURING, MODERN METHODS IN MARKETING, mean dollars saved for us and for our customers. The difference between the price of **ROYAL BRAND FENCE** is not through any inferior quality, as some agents wou'd have you believe. Every pound of wire that goes into **ROYAL BRAND FENCE,** is of the best that can be purchased, and the quality of galvanizing is maintained to the highest standard. Our manufacturing is done in the largest and most modern plant in Canada. High speed looms and up-to-date methods of handling enable us to manufacture fence at half the cost of any other plant. We sell direct to the farmer for cash. We require no travelling salesmen, we pay no commissions to anyone, and have no bad debts to ask the farmer help wipe out. All these advantages enable us to sell the best fence made in Canada, for the least money. The following is our unconditional guarantee: If you should receive a shipment of **ROYAL BRAND FENCE,** and you do not find it to be the best wire, the best galvanizing, and the most perfectly woven fence you ever purchased at any price, you are at liberty to return it, and we will pay charges both ways, and refund every cent of your money. Don't be mislead by unscrupulous agents who attack the quality of **ROYAL BRAND FENCE** in order to induce you to purchase from them a fence on which they can make a commission. Send your order to the factory, and save from one-third to one-half on your fence purchases. Our fence is all kept under cover, in enormous warehouses, situated on the railroad. You get nice bright bales, delivered, freight paid, at the prices below, any quantity from one bale to a carload, in 20, 30, and 40 rod bales only, and we make shipment the same day order is received

5-40-0 Has 5 line wires, 40 in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 10, 10, 10, 10. Price per rod . **18½c**

6-40-0 Has 6 line wires, 40 in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 7, 7, 8, 9, 9. Price per rod . **20½c**

7-40-0 Has 7 line wires, 40 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spacing 5, 6, 6, 7, 7 1-2, 8 1-2. Price per rod **23c**

8-40 Has 8 line wires, 40 in high, 2 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 6, 7, 7, 8. Price per rod . . **27½c**

7-48-0 Has 7 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spaceing 5, 6, 7, 9, 10, 11. Price per rod . **24c**

8-48 Has 8 line wires, 48 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 4, 5, 6, 7, 8, 9, 9. Price per rod . . . **28½c**

9-48-0 Has 9 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 5, 6, 8, 8, 9. Price per rod **28½c**

9-48 Same as 9-48-0, with 12 stays to the rod. Price per rod **30½c**

10-50 10 line wires, 50 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 3¼, 3½, 4 3-4, 5½, 6, 8, 8, 8. Price per rod **33c**

8-34 Has 8 line wires, 34 in. high, 24 stays to the rod. Top and bottom No. 9, filling No 12 hard steel wire. Spacing 3, 3¼, 3½, 4¾, 5½, 6, 8. Price per rod **21c**

15-50P. Stock and Poultry Fence. Has 15 line wires, 50 in. high, 24 stays to the rod; top and bottom No. 9, filling No. 12. Spacing very close for poultry. Price per rod **35c**

Stretcher. An all iron Stretcher, top and bottom draw, very heavy chain. Extra, single wire stretcher and splicer, freight paid with fence orders only . . . **$7.50**

The above prices include freight prepaid to any railroad station in Old Ontario, south of North Bay (steam boat and electric lines not included). To points in New Ontario, Quebec, Maritime Provinces and the north west, deduct two cents per rod from our printed prices, customer to pay his own freight from Sarnia. These prices will be in effect, up to July 1st, 1912. We urge upon you to order your fence at the earliest date possible, and assist us to keep to our standard, of shipment the same day we receive your order.

Remit cash with your order by registered letter, post office or express order.

THE SARNIA FENCE COMPANY, SARNIA, ONTARIO.

Tight Cooperage Manufactured 1910.

Tight cooperage barrels are used in the shipping of wines, whisky, beer, ale, oils and other liquids, and the stock used is required to be clear and of a species which will not impart its resinous or other taint to the contents. For these reasons oak, preferably white, is the principal wood used by the trade, and as this species cannot be obtained in Canada, the large shippers import it either as staves or in the log, from the United States. In the latter country, however, gum and basswood are rapidly taking the place of oak in sawed tight cooperage, so that in a short time a change may be looked for in the woods used in Canada. Statistics compiled by the Dominion Forestry Branch at Ottawa show that the tight cooperage industry in Canada during 1910 amounted in value to three hundred and forty-five thousand dollars. Nearly four-fifths of the total value was composed of staves, while heading to the value of$72,000 made up the balance. The staves production was as follows:—7,173,000 sawed staves worth $195,788; 923,000 ale and beer worth $44,814; and 319,000 bucked and split worth $72,240. Oak formed nearly three-quarters of the sawed staves, all the ale and beer staves, and all the bucked and split. Gum, a species of wood not hitherto reported, which should prove itself very satisfactory on account of its durability and freedom from flavor, stands third in the sawed stave table. In one year, with a production of 437,000 staves it surpassed all the native species except spruce. To fill the demand for tight cooperage in Canada, imports as reported by the Department of Trade and Commerce were as follows for 1910:—7,220,000 oak staves valued at $200,672; stave bolts to the value of $81,888 and 93,811 empty barrels worth $112,126.

FOR SALE!

We are offering at a very low figure the Holstein Bull (Victor of Fairmead) rising four years old, weight over 1800, Sire Jacob Van Voran, (twice Grand Champion, Charlottetown, over all Dairy Breeds), Dam Beauty of Fairmead, a Show Cow. "Official" record made five days after calving, 455 lbs. 14 oz. milk and 171.2 lbs. of butter in seven days—gave 12000 lbs. of milk this year on ordinary feed.

This bull won 2nd in class of five at Charlottetown this fall, and is an exceptionally fine animal in every way. Write for particulars to

Sec. 1—Cock—1st and 2nd, A. C. Reid, Tignish, P. E. I.; 3rd, Kingsdale Poultry & Supply Co.

Shall We Print One of These Five Roses Cookbooks For YOU Free?

To a good cook with good flour and a good recipe, ***nothing*** is impossible.
If you use FIVE ROSES, you already have the good cook and the good flour—
We will now give you the good recipes.
If it were possible for you to meet the very finest cooks in Canada face to face, and obtain from them first hand their favorite recipes and culinary wrinkles—
That would be splendid, wouldn't it?
To obtain this ***priceless*** information, wouldn't you readily give a little time and trouble?

Tried and Tested Recipes.

We will even do better than that for you.

Our office will be the exchange for the best cooks in the country.

Here we will collect their **tried and tested** recipes—we will arrange them in **logical** order (no small task)—we will print them in nice **readable** type on sturdy paper.

This will be the FIVE ROSES Cook-book—convenient in size—prettily illustrated in colors—the finest cook-book ever issued in Canada—in every way worthy of a LAKE OF THE WOODS product and of the housewives that use FIVE ROSES

Only Bread and Pastry.

And in order to make this book more valuable in its chosen sphere and cover a wider range, we will limit it to **one** special branch of home-making: THE ART OF BREAD AND PASTRY MAKING **only**:

But that's not all.

Besides the **thousands** of FIVE ROSES recipes, it will contain a vast amount of practical information and everyday hints invaluable to the housewife: Wrinkles laboriously accumulated in our **quarter century's** experience with housewives and bakers.

Limited Edition.

The cost of publishing this work must inevitably be considerable, and therefore, the edition **must be limited.**

So there is only **one** way to secure a copy—it is this:

Would you trade **five minutes** of your time for such a useful article?

So valuable that we could not charge enough for it, and so give it to you **free**—if you use FIVE ROSES.

We merely ask your co-operation: Madam your contribution.

Will YOU be one of the contributors—will YOU take place among the best cooks in Canada—will YOUR name appear in the FIVE ROSES Cook-book?

Then write out a favorite recipe—one or more—bread and pastry—send it in NOW.

Its the only way to secure YOUR copy.

Get Your Copy.

See list to your right.

It offers many suggestions.

We want just plain, ordinary, everyday recipes—economical recipes.

Your reward will be a copy of this book just as soon as it is off the press, a souvenir of the **combined** efforts of the very best Canadian housewives.

The lists will close on **January 15th, 1912**, and all recipes should be in our hands on or before that date.

The name of each contributor will appear after each recipe submitted in the cookbook.

Please write on only **one** side of the paper. Do not fail to sign your name. Give **full** address: No. and name of street, city and province.

Don't delay—remember the edition is **limited** and we expect a big demand—get YOUR name in early.

Write out your contribution NOW—mail **to-day.**

Sec. 1—1911 Male—1st, Robt. Black, Amherst, N. S.; 2nd and 4th, Thos. J. Etter; 3rd, Hartland Poultry Yards.

AT THE SHEEP MEN'S MEETING.

Mr. Rich outlined the objects of the Association and Messrs. S. A. Logan J. B. Daggett, J. A. Telfer, Geo. Retson, W. W. Hubbard and S. L. Peters spoke of some of the questions that could be effectively handled by the Association all of which would tend towards the upliftinb of the sheep industry in the Maritime Provinces.

Persons wishing to help the Sheep Industry along should join the Association. Mr. Telfer will be pleased to enlist every sheep man in Nova Scotia, New Brunswick and Prince Edward Island. He has such faith in the sheep business that we believe he would sit up nights filling in membership certificates. Keep him busy for a while.

How to Completely Cure

nearly 100 diseases of farm stock is told in FLEMING'S VEST POCKET VETERINARY ADVISER. Write for this indexed, illustrated 96 page book—it's free.

Tells how to cure the dreaded

LUMP JAW

in a safe, quick, easy way. The first successful cure — the one that cures the highest percentage of cases, and the worst one's, is

Fleming's Lump Jaw Cure

If it or any other of Fleming's Remedies fails to cure, we will refund your money.

Gold Medal for Intercolonial Railway.

The Intercolonial Railway has received notice of the award of a gold medal by the Directors of the Canadian National Exhibition, Toronto, Ont., for the fine display made by the Railway last September, when the "Ocean Limited" Express was ingeniously featured in a large illuminated motion picture which attracted a great deal of attention from the throngs of visitors. The whole display made by the I. C. R. of pictures mounted specimens of fish and game, etc., was very attractive, and the highest award of the Exhibition Management was not amiss. The total attendance at Toronto Exhibition this year was nearly up to the million mark.

Special Fares for the Holiday Season.

On the Intercolonial Railway special fares will prevail for Christmas and New Years. Between all stations on the line a one way first class fare will prevail from December 21st to January 1st, good for return until January 3rd. To Detroit, Port Huron, Sault Ste. Marie, Buffalo, Niagara Falls and points east in Canada beyond Montreal the fare will be first class one way to Montreal added to first class one way fare and one third class beyond; good going from December 21st to January 1st and good for return until January 3rd. This is a pretty generous limit for these reduced fare tickets and it gives ample opportunity for those who wish to spend the Christmas season at home or with relations or friends elsewhere.

THE BOOK DESCRIBES EVERY STEP IN DETAIL

IN the organization and construction of rural telephone lines, this book, "How to Build Rural Telephone Lines," is a practical guide. It is a carefully classified volume, covering everything you need to know, from the inception of the idea to the moment the telephone is hanging on your own wall, ready for you to use. No question on the building of rural telephone lines can possibly arise without your being able to find the answer to it in this volume. It offers explanation on every point—the solution for every problem. If you are even the least bit interested in the subject, all you have to do is to clip, sign and mail the coupon and

We Will Send You FREE This Book on "How to Build Rural Telephone Lines"

Bear in mind that **you have to ask** for this volume to get it. This book represents 100 profusely illustrated pages of vital facts, bound in stiff, cloth-covered binding. Apart entirely from the cost of printing and binding, this book represents the brain work of experienced telephone men—has cost us so much money that we really ought to make a charge for it. So long as the edition lasts, however, we are willing to send it FREE to every farmer who, by using the coupon, signifies that he is interested in the subject. This book is very frank, it tells you exactly what you can do, what you must do and what you cannot do; you will be interested in the straightforward way in which it comes out with vital information. Systems of rural telephone lines are spreading a network throughout the Dominion in the form of community-owned companies. Sooner or later someone will organize such a system in your locality. Why shouldn't **you** be the man to do it? In any event you owe it to yourself to know all there is to know about this subject. Better send the coupon NOW, while you are thinking about it.

Short Courses at the Agricultural College

TRURO, NOVA SCOTIA

January 2nd to 12th, 1912

The next Short Course for farmers and farmers' sons will embrace all the features in connection with Soil Cultivation, Live Stock, Horticulture, Dairying, Poultry and Veterinary Science that have made the previous Courses so valuable and popular. In addition, instruction in the running of Gasoline Engines will be added, for which purpose the various manufacturers will have their machines on exhibition. Particular attention will be given to Power Sprayers.

The Short Course for Ladies, held on the same dates, promises to be the most largely attended yet. The subjects taught will be Dairying, Horticulture, Poultry, Domestic Science, and students may attend selective classes from the above Courses.

Tution to students from all the Maritime Provinces FREE.

Board will cost from $3.50 to $4.00 per week.

All Railways grant SINGLE FARE privilege.

Agricultural Progress in Newfoundland

St. John's Agricultural Society is Up and Doing.

By P. G. Bulter.

THE St. John's Agricultural Society is "up and doing" importing and supplying to farmers Seeds and Machinery of the best guaranteed quality obtainable in Canada, at greatly reduced prices; also lambs, calves, cows, swine and other animals of pedigree stock, free of duty, for registration in the country.

Many copies of the Maritime Farmer, the official organ of the Society, are distributed free at each Executive and Special Commitee Meeting, fortnightly and on Saturdays in the British Hall, when people also subscribe to this helpful Journal and value it highly. Bulletins on Sheep Raising, etc. received from various Agricultural Boards are also distributed and exchanged frequently and regularly among Agricultural live stock keepers at these meetings, and do much good—a practical library worth having.

Its efforts are also being directed towards the advancement of the great Sheep Raising industry in the districts of St. John's East and West; no less than three shipments of sheep have been already imported from Canada and shared out by the Board, fourteen of the last shipment in St. John's districts alone.

At a well attended meeting of the Society held recently in the British Hall, the following resolution was proposed, seconded and passed unanimously: "That a vote be taken in the Electoral Districts of St. John's East and West as soon as possible, for the destroying of dogs in these districts, to enable its people to go into the valuable industry of Sheep Raising as desired by this Society and deserving of protection and encouragement."

Therefore, this matter has been taken up and will be carried into effect first in St. John's West with as little delay as possible, as the farmers say the few sheep they have are being destroyed by dogs, and those sent out by the Society for breeding purposes are in danger of destruction. Even calves have been killed by dogs recently, so that the farmers run very great risks and this matter needs immediate attention.

The Society considers that the present law for the muzzling, chaining or clogging of dogs and the allowing of setters, etc. to run at large is of no practical value; and although frequent requests have been made as to its being carried out it is openly violated with impunity as everyone knows, therefore, the extermation of dogs that kill sheep in these districts is the only effective remedy.

A few persons may argue that sheep breaking into fields would do still more harm by destroying crops, but the answer is that this is not the case where the sheep industry is being carried on. Sheep Raising is bound to come and the best plan is to get ready for it by putting up wire fences now.

The Society is ready to send out the petition next week prohibiting the keeping of dogs in St. John's West after this winter. Everything possible is being done to advance the interests of the people in this Sheep Raising industry.

President Cowan and Vice-President Snow have been appointed to visit the different settlements during this month, to find out the number of people who koep sheep, the number they keep, the prospects for Sheep Raising in each place and to select the best keepers in preference to anybody who might come along or apply, for during the last few weeks I have received no less than fifty applications for Agricultural Sheep, and this will show you the necessity for using good discretion and the interest that has been awakened in the movement. What is needed is immediate Action, more stock, more instructions, more supervision, and the only means of protection, the killing of dogs, to advancet his work.

The killing of dogs without giving the owners a few ponies between them as well as sheep is to be regretted, but of course, the branch railways and the peat industry here will compensate to a certain extent in facilitating transport operations, especially in getting out fire wood or fuel in car loads, in many cases where dogs were employed previously. In the case of Petty Harbour, where 400 dogs are used for hauling wood in winter, the railway now comes within two miles of the settlement.

I have replied to several advertisements I have seen in Canadian and English papers, in which ponies are offered at only a few dollars each, and it is possible that the people referred to might be persuaded to invest in these in preference to dogs in the future, because it is absolutely necessary that the dogs which are killing the sheep be destroyed and prohibited before very much can be done in Sheep Raising in St. John's West, at least. Therefore, it is hoped that a majority of the people in St. John's West will sign the petition, a copy of which is appended hereto and that the law will be carried out after the 1st day of May next; then and not till then, will there be nothing to prevent people from getting into this great and profitable industry on a large scale as the shortage and high prices of mutton and wool here, and the starting of the new wool factory in St. John's recently, unmistakably prove that there is a great market for mutton and wool at our very doors.

COPY OF PETITION.

To His Excellency the Governor in Council:

The petition of the undersigned humbly showeth:—

That your petitioners are duly qualified electors residing in an area or section of the electoral district of St. John's West comprised and bounded as follows: All outside the municipality of St. John's.

That the said area or section contains the following settlements: Kilbride, Goulds, Petty Harbour, Mount Pearl Road, Topaal Road, Freshwater, Mundy Pond Road, Black Marsh Road, Black Head, Broad Cove, Maddock's Cove, etc.

That your petitioners are desirous and humbly pray your Excellency in Council that a proclamation or notice be issued under the provisions of Chapter 141 of the Consolidated Statutes, prohibiting the keeping of dogs within the above described area or section of the said district after the first day of May, 1912, and your petitioners will ever pay, etc.

LIVE STOCK KEEPER'S BOND.

The following copy of the agreement or bond that our live stock keepers are required to sign, will show that the animals so far sent out cannot be "killed for Christmas" and that the Agricultural Society is not "incapable" as intimated in one of the local papers; also the keepers are choosen on merit, without any respect to party inclinations as is proved by the fact that people on both sides of politics have received Agricultural Society live stock, seeds, machinery, etc., without any discrimination whatever in this respect. Therefore, the assertion that the Society favours either of the two political parties is groundless.

FORM OF AGREEMENT FOR EACH KEEPER

It is hereby mutually agreed between the President of the Agricultural Society of St. John's, Newfoundland, of the first part, and the keeper of the Societie's live stock in the District of St. John's East and West of the second part, that the party of the first part agrees to provide and the said party of the second part agrees to take and keep at his own risk and expense for service at his farm, a bull, sheep. calf, cow or other animal for a period of three years from the date of this agreement. The said party of the second part also agrees to keep the said animal in good order and condition and to permit the said party of the first part or any person or persons authorized by him to inspect the said animal at any time or times to ascertain its condition and should the said party of the first part or such person or persons appointed by him, as aforesaid, be not satisfied with the condition, management or treatment of the said animal to deliver him up to the said party of the first part on receipt of his written order to do so. And further he agrees not to kill the said animal unless in the event of its becoming vicious and then only after notifying the said party of the first part and receiving written authority to that effect. The said party of the second part also further agrees at any time, on receiving an order in writing from the said party of the first part to return the said animal and take in exchange any other animal which may be forwarded by the party of first part.

Registration of Stock—and the said party of the second part also agrees to keep a record of progeny of each animal and to furnish the said party of the first part or such person or persons as he may authorize to receive the same, on or before the first day of July in each year during the continuance of this agreement with a copy of the said record for the year last past, namely, from the first day of July to the last day of June. And the said party of the first part, in consideration of this agreement, agrees that the said animal shall become the property of the said party of the second part at the expiration of the term of three years hereinbefore mentioned.

DATED at this day of A.D. 19 .

Signed in the presence of

Information Wanted.

Editor Maritime Farmer:

To advance the interest of Sheep Raising in this country the St. John's Agricultural Society is encouraging people to keep ponies instead of dogs. In fact all dogs in St. John's districts, no difference how beautiful, will have "to pass in their cheques" after the first day of May next—even the favorite "Newfoundland Dog" must go. Therefore, I wish to know if you or any of your readers would kindly tell me where reliable ponies can be secured cheap in Canada, and the price given per dozen, F.O.B. or C.I.F. St. John's; also where dog skins can be sold, and the price given for each.

The Society will also be importing more sheep, calves, swine and cows in the spring, and will be glad of particulars and prices from any of your advertisers who deal in live stock.

Thanking you for a reply, and for your kindness in inserting this in the Maritime Farmer.—P. G. Butler.

Editor's note:—Can any of our readers give the desired information? Our stock breeders would do well by corresponding with Mr. Butler, telling him what stock they have for sale and at what prices F.O.B.

Care of Potato Seed.

The Minnesota experiment station advises farmers that potatoes for seed should be carefully stored where the temperature will be as low as possible without freezing the potatoes. Narrow bins, slightly raised from the floor, and with slatted sides, are much better for storing seed potatoes than are tight bins. Cellars can often be kept reasonably cool, early in the fall and in the spring, by leaving the windows open at night and closing them in the day time.

THE MEN WHO ADVERTISE in the Maritime Farmer are experts in their business. It will pay you to consult them about your needs in their line. Tell them you are writing them because you saw their advertisement in the Maritime Farmer where all ads are guaranteed.

Maritime Agricultural Societies

Promoting Agriculture at Little She-mogue, N. B.

Editor Maritime Farmer:

Under separate cover, I am sending you a copy of the prize list of our exhibition. If you will refer to its pages you will find mention of some of the lines of work which are proving interesting and valuable in promoting interest in our Agricultural Society and its work.

"Standing cropcompetitions," "exhibits of grain in sheaf," "essays on agricultural subjects," "school competions both in map drawing and writing," held on exhibition day. "collections of weeds and weed seeds," "a cup for the best kept farm" and "a plowing match" are some of the things that are helping to promote agriculture in this district. If any of this work will be of benefit to any reader or other society, we will appreciate it all the more.—J. R. Taylor.

Editor's note: The prize essays referred to in the above article appeared in a recent issue of the Maritime Farmer.

Notes From Grand Falls, N. B.

Editor Maritime Farmer:—

Our Agricultural Society ceased to exist four years ago. Our farmers have adopted a rotation of crops and seed down considerable quantities of clover.

The favorite breeds of live stock in this locality are: Clydesdale and Percheron horses, Holstein and Jersey cattle and a few Ayrshire crosses, Chester White and Yorkshire Swine, and in sheep, mostly all Cotswold and Leicester crosses.

We had a very dry April and May so that there was no broken time during the seeding season. The new grass did not get a good start so newly seeded fields and old meadows were rather light in hay yield. There will, however, be an ample supply of hay for the local demand.

Grains gave a good yield. We do not sow much wheat here as the early frosts have been causing a lot of damage for several years.

Potatoes, which are being exte sively grown in this section, gave good yield.

Garden crops were all good a came in early for this section. Nea every family plant a small kitch garden and grow their own vege bles.

The apple crop, where trees w well cared for, did well. When army worm did not gain a footho gooseberries and currents were good crop.

We do not grow many cultiva strawberries, as we have an abu ance of the wild variety, which d not require cultivating.—Jam Watson.

Andover a Progressive Society.

Editor Maritime Farmer;—

We are advancing in our farm operations rather slowly but, I thi surely. We are gradually doing a with hand labour and using m horse power and machinery. G help is so scarce and wages are high that we are forced to machinery. A few years ago, could be had for from $16 to $20 month, now we pay from $25 to This scarcity of help has affected dairy business more than any ot branch. There are less cows in country to day than ten years but they better fed better c for. The crease in potato bu ess has affected dairy, as as the g There is little b raised in section n and we a home ma for about of it. T are quit number hogs ra but they about all on the ma during two months of October and Nov ber and this sends the price d Good draft horses can hardly found for sale at any price.

The dry weather in the spring an excellent chance for seeding, it was too dry for the grass, and hay crop was short of an aver especially on high land. Grain l ed well and gave promise of a crop, but the very hot and later weather, ripened it too fast befo had time to fill well.

Potatoes were good, although bugs have been plentiful. T was very little blight but dry weather affected the y Turnips also suffered for lack of Potatoes and hay are about the farm products that are shipped this section now. A large am of last years hay was held, awa

New Brunswick School Children are Interested in Fruit Growing. Display of Jams, Jellies and Preserved Fruits Made by the Pupils of the Consolidated School, Kingston, N. B., at the Recent New Brunswick Fruit Show.

a better price.

Our society is trying to help the farmers in procuring good seeds. Last spring we bought nearly $1,700 of grass seeds also 100 tons fertilizer, this was all sold at cost. For two years we have conducted a standing grain competition, this tends to more care with seed and better cultivation. We usually bring in a few pure bred cattle, sheep and pigs every year. Our membership is increasing. We give the Maritime Farmer to each member. The first Women's Institute of the province was organized at Andover this summer. We expect it to do considerable for the welfare and prosperity of the community.—S. B. Wright.

Tidings from Bear River.

Editor Maritime Farmer:—

This vicinity has witnessed much argciultural progress during the past few years. More land is being tilled, the orchards are being better cared for and interest in agriculture is on the increase.

The condition of crops last season, we are sorry to say, was below the average on account of the exceedingly dry season. Hay gave only about two-thirds of an average crop on account of the exceedingly dry season. The potato crop was also below the average. Grain did well in some of our districts but on the highlands the straw was short and poorly headed so that taken as a whole we only had a medium yield. Turnips, mangels and beets did well with some of our farmers while with others they were almost a complete failure. Fruit did well and was particularly free from spot.

The influence of the Agricultural Society for more modern methods leading to "know how" farming has been and is good.

The society had under its control, this year, one Guernsey bull and two Shorthorn bulls, one of which is from a good milking strain. More interest is being taken in the raising of pure bred stock by the members.

The Digby County exhibition was held last October under the auspices of our society.—Geo. I. Brooks.

Slow But Steady Progress.

Editor Maritime Farmer:—

This part of Cape Breton, is making slow but steady progress in the various branches of agriculture. Crops during the past season were very good, although hay was somewhat light on the uplands. We have areas of lowlands and intervals which give an abundant yield so that the crop as a whole will be about average. Our grain crop turned out well.

We believe agricultural societies are doing much good in interesting young men in farm work, and thus induce them to remain at home and go along in the march of improvement. Our society was only organized last year, and of course, we have not as yet been able to do a great deal of work.

Our aim is largely to improve the dairy cattle in this district, and to this end we have purchased a fine 3-year old Holstein bull.

After we see how his stock turns out, and as our society gains strength we will try to improve the other classes of farm live stock.

We are satisfied that the man who farms intelligently in a willing way will make a better living and have a dollar to spare for adverse days than can a labourer in any other class of work.—Gordon J. McLeod, Cleveland, N. S.

A Good Farmer's Cow.

Champion Grade dairy cow at the recent Maritime Winter Fair, Amherst, N. S. This cow was sired by a pure bred Holstein bull and consequently she won the Holstein Friesian Association's Silver Cup. 138.4 pounds milk yielding 4.76 pounds butter fat in 48 hours. Owned and exhibited by Fowler Bros., Amherst Point, N. S.

Fanny K.

The Champion Grade dairy cow also sired by a Holstein bull, at the 1910 Amherst Winter Fair. She had the largest flow of milk, 162.7 pounds at the 1911 Fair but her butter fat production was only 4.14 pounds in 48 hours. Owned by T. W. Keillor, Amherst Point, N. S.

Hemford Agricultural Society.

Editor Maritime Farmer:—

As I am the past secretary of our agricultural society I feel it my duty to respond to a letter handed to me for reply by our present secretary.

I have been a regular subscriber to the Marieime Farmer for the past few years, although I am not a farmer, nevertheless I take a deep interest in farming, for I was raised on a small farm. I take a particular interest in Agricultural Society work. I am pleased to state that I was one of those who helped to organize and keep running our Society. You and probably many of the officers of Agricultural Societies who may read this will know that the organization of an agricultural society is only a small part of the energy necessary to keep matters running smoothly. It requires a lot of active work by the various officers.

We meet with quite a lot of opposition to our society in the form of scrub bulls being allowed to run at large and a lot of cheap talk. Some people say the Agricultural Society is no good and that the pure bred stock we have do not suit them as well as the scrubs. In the face of matters of this kind our society has had its ups and downs, as I suppose all other societies have experienced in the past. I am pleased to state that the financial standing of our society is at present, on a solidbas is. We own a good Durham bull, 16 months old, that is well patronized.

Our society is growing in strength, as cattle for the past year have been very high in price and our people are realizing that it pays to keep good stock. We had a fair crop of hay on our uplands, but not so much as last year, while our meadows were fully as good if not better than last year. Grain and roots did not turn out as well as we would wish, owing to the dryness of the season.

Brooks that we not dry for years were dry for a while last season.

Should this letter be printed, I suppose a lot of people will wonder where Hemford is, so I will tell them. Hempford is a little village in Lunenburg Co., N. S., on the Caledonia Branch of the Halifax and Southwestern Railway, 6 miles from New Germany. We have a railway station here around which clusters a very nice business centre. Farming in summer and lumbering in winter are the principal occupations that tend to keep this thriving little centre agoing.

Farming interests are on the increase, due to high prices for live stock, and to the work of improvement that is being done by the agricultural society. Mr. Fuller, superintendent of Agricultural Societies, has visited us, and was quite well pleased with our progress. He has promised us a share of the Institute speakers in the future, which will benefit our society a great deal.

My Maritime Farmer is always claimed by some one as soon as I am through reading it, so it is needless to say that our people find matters of interest in its columns.—E. W. Mailman.

Rogers Hill in the Line of Improvement.

Editor Maritime Farmer:—

Our Agricultural Society consists of 25 members, all farmers, and all are doing their best to make their business a success. Some years ago, when our society was organized, we made the mistake that lots of other societies are making, viz: — wanting too many breeds of cattle. But as we are all patrons of the creamery at Scotsburn, we are now all of one mind, and are breeding for dairy purposes. We have been breeding Guernesys for a number of years. We own two first-class pure bred bulls, and by keeping heifers from our best cows we are steadily improving our breeds.

Methods of farming are also changing in this section. Before the creamery was started we depended on mixed farming, as we were near Westville and Stellarton, both good local markets, and prices for potatoes, hay, vegetables of all kinds, and fruit were good. Most of our members manufactured their own butter, and by raising the above mentioned produce managed to make a fairly good business, but with a good deal of hard work.

Since the advent of the creamery we are beginning to devote most of our time to dairying, members are keeping more cattle and are feeding them better, and instead of raising vegetables for market, are raising more feed for their dairy cows.

Owing to the very dry summer

THE TWILIGHT OF 1911.

Christmas is already here and the twilight of 1911 is rapidly stealing upon us. Soon Father Time will have pulled up the anchor of the year and 1911 will be allowed to drift off into history. Like an influence it can never die. It will have a silent place in the foundation of future history. Like a word let slip, it will never be recalled. The use we have made of it can never be changed. 1911 has given us fairly good seasons and there are evidences of prosperity on every hand. Many difficulties have been encountered and met. Filled with hopes for favorable seasons next year you do not feel sorry as you watch the twilight gather. You look forward to awakening activities, after a brief rest from field work. If you have spent your time and energies well during 1911, you will feel at peace with the world and welcome the dawn of the young, untiring 1912.

RESOLUTIONS FOR THE NEW YEAR.

It is quite customary for persons in all walks of life to make new resolutions, or "turn over a new leaf" at the commencement of a new year. Not a few go forward with their new resolutions ever in view and looking forward to higher ideals. To these success comes sooner or later. Others forget their resolutions almost as soon as they are made and instead of going forward they are found repeating the disastrous mistakes of other years. Instead of attaining success the latter class are found, year after year, plodding along in the same old groove. Let us no longer belong to the latter class, but rather choose the plans exemplified by the former class, and with stubborn persistency aim to make the year I912 a profitable one for ourself and the world at large.

Following are a few resolutions that are worthy of consideration :

Resolved to attend the short courses at the Truro Agricultural College.

Resolved to be more up-to-date in my farming operations.

Resolsed to help supply the demands of the home market.

Resolved to attend as many Institute and farmers meetings as possible.

Resolved to feed and care for my live stock better than ever.

Resolved to test my cows and to get rid, by the shortest possible route, of each and every animal that does not pay.

Resolved to feed, weed and breed my herd of cows so that I may bring them up to an average of at least 8000 pounds of milk a year, and by systematic selection, aim for even higher individual production.

Resolved not to sell anything from the farm except as a finished product.

Resolved to be more careful in the handling of dairy products.

Resolved to be more careful in the housing of my farm machinery.

Resolved to keep a strict account of all my transactions so that I may know my financial standing at any time.

Resolved to store enough ice to last for all household and dairy purposes for one year.

Resolved that when I appear in public I shall strive to do so in such a way, as to bring the mast credit to avocation.

Resolved to read all I can about my chosen calling and take a deep interest in matters that require the attentian of all good citizens.

Resolved to so treat my boys and girls that they will like to remain on the farm instead of moving city events.

Resolved to secure, at least, one new subscriber to the Maritime Farmer, knowing the more rgricultural literature that is read by my neighbors, the more rapid will be the progress of advanced agriculture.

A Merry Christmas and a Happy and Prosperous New Year to all our readers is the hearty wish of the Management and Editors of the Maritime Farmer.

LAST CALL TO THE COLLEGE SHORT COURSES.

Before the first January issue of the Maritime Farmer reaches our readers the 1912 short courses at the Nova Scotia Agricultural College will be in full swing.

Preparations are now being made for the accommodation of what promises to be the largest short course class in the history of the college. These short courses are held during the first two weeks of January each year, for the benefit of farmers and farmers' sons, who cannot spare the time from home to take a long course.

Over 300 farmers and farmers' sons, hailing from all parts of the Maritime Provinces, attended this course last year. They varied in age from 16 to 70, the large proportion being over 30 years. In this course, the very gist of the college work is given. Many have profited by and been pleased so much with the course that they have taken it two or three times. The expenses are light. No tuition is charged. Board has to be paid for ten days at from $3.50 to $4.00 per week, and the railways grant a single fare return from all parts of the Maritime Provinces.

At the same time, as the Short Course for men, a similar Course for ladies is conducted. The principal subjects taught are Dairying, Horticulture, Poultry and Domestic Science. Besides, the ladies are at liberty to take any of the classes in connection with the men's Short Course. The conditions of entrance, expenses, etc., are the same as for the men's Short Course. There were 26 in this class last year, but a much larger number is anticipated for the ensuing year.

Even if never turned to practical account, ladies will find this short course of great benefit. It makes life in the country and even the city more interesting if you know the reason of things and can intelligently discuss problems related to the farm. Besides, the knowledge acquired of butter making, the making of soft cheeses in the home, poultry raising, flower and vegetable growing, cooking and house management, etc., should prove of the greatest value.

Untold benefit has already been derived from these short courses. Can you afford, in this progressive century, to miss the opportunity offered by this most important event of the year 1912? Remember the dates January 2nd to 12th, 1912.

ECONOMICAL FEEDING.

The question of feeding economically is as great as farming economically. The man who contended his cow could live on fresh air didn't quite succeed, because she died about the time he cut her down to one straw a day. No doubt he was feeding economically; yet it didn't pay. There are various tables showing analyses of feed stuffs and it is a good plan to work out a ration that you think best, using your best judgment in studying the capacity of the cow, and weighing and testing her product and then feeding accordingly. You may make mistakes, many of them you never know, no doubt, yet in the main you will be constantly increasing your herd, your land will be getting richer, you will be building better buildings and getting more and better equipment. You may not have a bank account beyond your everyday needs, you may not have money loaned out, you may not possess bank stock nor railroad bonds yet it may give as much satisfaction to see your nice heifers, colts,

pigs, sheep and poultry and to know that you are trying to carry on a progressive and up-to-date line of work, even if you cannot count your profits in dollars. To farm economically is much like any other business. One must spend money to make money. A good building, a fine bull, a valuable mare, will often pay more than six per cent on the investment.

What an Ex-Student Says of the N. S. A. C. Short Courses.

Editor Maritime Farmer:—

I wish to call the attention of the readers of your valuable paper, to the opening of the short courses in agriculture at the Nova Scotia Agricultural College, at Truro, N. S. As doubtless most of your readers are aware, the attendance at these short courses have grown in a most remarkable manner from year to year, as the following figures will show: First year, 60. Last year 300.

The regular college staff are assisted by the best experts, in the various subjects, obtainable in Canada.

The lectures given to the students are of the most practical nature, and perfectly easy for any person to understand. I find in travelling about the country, that some are under the impression that you would need to be a college professor to get at the meaning of the lectures. This is not so. To the average stockman, the demonstrations given in up-to-date judging of all kinds of live stock is easily worth all the expense and time taken by the course, The actual showing to the students of the good and bad types of live stock, and showing the difference between various animals of the same breed, impress them in such a manner as no amount of reading could possibly do. It is a well known fact among all feeders that the buying of the right or wrong type of either beef or dairy cattle, decides whether they will make a profit or loss on the transaction. And as live stock must continue to be the main stay of maritime agriculture, I cannot emphasize this point too strongly on your readers. What is true of this branch of the course is true of all the other branches.

If a man is interested in Horticulture for instance, there are always expert apple growers there from the Valley and elsewhere, who will make him feel as though he should go home and plant an apple tree before going to bed. In these days of fungus and insect pests, so damaging to our various crops, any knowledge as to their suppression or control is of vital importance to us all. And the proper methods to follow to arrive at these results are handled in a most efficient manner by the college staff. Time and space will not permit me to mention in detail each subject taught, nor is it necessary so do. If one is important, the others are perhaps more so, and therefore, as one who has attended the "short courses," and went back and did it the second time, I would say "by all means plan on taking a little holiday and go to Truro the first of January next and you will never regret it, even if you did nothing else than pass experience with your brother farmers."

As to the benefits of the special course for ladies, well! ask the girls what they think of it themselves when you go to Truro.—W. L. MacFarlane, Cumberland Co., N. S.

Editors Note:—We want many more young men like Mr. McFarlane. As stated above he took a short course at the college and finding the results so beneficial he went back and did the same thing over again. Nor was he content with this, he went back again and took the full two years course and graduated last spring. Since then he has been busy on his farm at Fox Harbor, Cumberland Co. He was in St. John this week to superintend the shipping of a carload of 16 head of pure bred Clydesdale fillies that arrived on thd 19th inst. from Scotland, on the Donaldson Liner S.S. Salacia, for B. H. Bull & Sons, Brampton, Ontario.

Display Made by the St. John River Valley Farm and Fruit Lands Co., Burton, Sunbury Co., N. B. at the Recent N. B. Fruit Show.

The Value of Agricultural Education.

Editor Maritime Farmer:—

It is important that the farmers of to day should be educated along their lines of business?

Is there anything to be learned from science as relating to farm work?

To the ones who would say No! to the questions above, I hope they are few, I think we are justified in calling them back numbers. To the ones that will say Yes! is the one to whom this article appeals.

"The twillght of 1911 will soon be stealing in upon us. Soon Father Time will have pulled up the anchor of the year 1911, and it will drift off into the ocean of history. The use we make of it can never be changed, like a misspoken word it can never be recalled."

It is now up to us to use the year 1912, for a larger field of usefulness, than we have used the year that now is swiftly passing into history; remembering the fact thst our years are fast reeling off, and that if we wish to make good, we must, as the poet says: "Be up and doing."

The knowing of how to do the "doing," is I believe, of vast importance.

On the 2nd of next month there will open in the Agriculture College at Truro, N. S., the two week's Short Courses, which has been held there for the past number of years.

They occupy the same length of time as the short courses at the Ontario Agricultural College. I might say that in every Agricultural College in the United States and Canada, and there are many of them, short courses are held during the winter for the advantage of those who cannot take in the long courses.

Considerable has already been said and written about the short courses at Truro. "Truth, however, will always stand repeating." Repeatenly bring to the notice of farmers and their sons what a mine of agricultural knowledge lies at their very doors, cannot be amiss. The way that the short courses are yearly drawing larger numbers to the class rooms at the Agricultural College at Truro, is certainly proof positive that there is something to be gained by attending them.

It cannot be denied that the farmers of these times should have an education to fit them for their work. Some one has said: "The basis of all civilization is agriculture." Can we measure the importance of what agriculture is to the world to day? In fact, agriculture has always been a gage to indicate the progress of a nation or a people. Every nation that has comprehended the significance of its own existence has done what it could to promote the intelligence of the farming class. Look at the nations of the world to day, that are almost useless, where ignorance prevails and civilization does not flourish, and no doubt it will never flourish nor advance until its farmers and the common people feel the uplifting influence of agricultural education. What is it that will make this Canada of ours a greater Canada? What is it that will make these provinces down by the sea, the great east of Canada? Is it anything more than a better knowledge of the art of agriculture and the things that pertain to it.

"Perfect Agriculture is the true foundation of trade and industry," —it is the foundation of the riches of allcivilized domains. We will be nearing the perfect. when we can grow two blades of grass where one grew before, when seting out trees and flowers to improve the looks of the farm home will be the rule rathsr than the exception; when we take better care of our orchard; when we improve our stock and take better care of it. Ontario is nearing the perfect. What is doing it? Who will say that it is not the reading of agriculture literature and the influence of the Ontario Agricultural College in creating an awakening among the farming class? In a nut shell, it is a better understanding of the things pertaining to farm life.

It is at Truro we Maritime farmers can get a better understanding of farm work and learn to elevate our calling to show that there is plenty of room in it for the exercise of all the brain power a man may possess and to point out how farming operations may be improved and conducted to the best advantage to the tiller of the soil. Perhaps there are some who will say that there were farmers, and there are farmers to day who have made a grand success of farming.

(Continued on page 201.)

HORTICULTURE.

Harvesting Onions.

If you have white onions, pull them as soon as a majority of the tops fall. Lay them in rows with the tops at right angles to the rows. Consult the weather man, and don't pull at the beginning of a wet spell. Put on your whole force when they are fit to pick, and do it quickly. In a day or two the roots will be killed, then top, and if dry, store immediately in a well ventilated room, dark, if you can make it so. Light turns them green, and if they get wet and dirty they will never get clean again. This rule applies to red and yellow, although not in so marked a degree, for the outside layer will dry and peel off from these varieties, but they will get weather beaten and faded if left long in the field.

My rule in selling is to let the buyers have them when they want them badly. I have sometimes taken less than my neighbors who were holding for more money, and I have known them to haul theirs to the dump. If prices are good when they can be hauled from the field, it will be a long time, probably before they are better, and the shrinkage in onions is large and increases toward spring. However, prices are usually better in February than November, all things considered, and it generally pays to keep them if they are well stored.

As a rule, white onions are best sold in the fall, for they are very liable to a black mold that gradually spreads over the outer skin and even through the under layers and effectually cuts the price, or may render them wholly unsalable.

It is well before selling to pass the white and yellow over an inch and the red over 1¼ inch screen, leaving out the small ones, which are useless, excepting the small white, which may be used for pickling. If they are not uniform in size, again separate the large white and yellow from the small, for the latter are the best sellers to the best trade.

Finally, don't try to beat the buyer by smuggling in dirt and poor onions. That hurts the market and therefore hurts your neighbor. It hurts the confidence of man in man, and at least reverts back to yourself, whom it hurts worst of all.

Why Fertilize Apple Trees?

Is it necessary to fertilize an apple orchard? For 15 years U. P. Hedrick, of the New York Experiment Station at Geneva, has been carrying on experiments to determine whether or not apple trees need fertilizers other than those in the soil. The following are his conclusions as published in a recent bulletin:

"The fertilizers have had no sensible effects upon the yield of fruit in this experiment.

"The size of the apples is possibly increased by the fertilizers since the percentage of culls and seconds is a trifle higher in the check plats.

"The several current generalization as to the effects of fertilizers on apples find no verification in this experiment.

"All the trees in the several plats have born crops very uniform in maturity, keeping-quality, texture and flavor of apples.

The foliage in the plats receiving nitrogen was greener than in other plats during the last season, the first difference to be certainly counted as an effect of a fertilizer.

"There was also a measurable effect of the nitrogen in the weight of the leaves.

"There is slight evidence that the trees in plats to which nitrogen is applied are making a greater annual growth of branches.

POTASH FOR 713 YEARS.

An analysis of the soil before the experiment was begun shows that at that time there was, in the upper foot of soil, enough nitrogen per acre to last mature apple trees 183 years, of phosphoric acid, 295 years, of potash, 713 years. From this well-nigh inexhaustable storehouse, tillage, cover-crops and good care have made available all the plant food these trees needed.

"A fruit-grower may assume that his trees do not need fertilizers if they are vigorous and making a fair amount of new wood. If the trees are not vigorous the drainage, tillage and sanitary conditions of the orchard should be looked to first and the fertilization afterward if then found necessary. Lastly, before using fertilizers the fruit grower should obtain positive evidence by the experimentation as to whether an orchard needs fertilizers, and what ones. A distinction must be drawn between fertilizing apples and fertilizing grass and apples. In Mr. Hedrick's experiments no crop was taken from the land but apples. Intensive cultivation and cover crops were used.

Make a second and a most thoughtful inspection of all fruit and vegetables before placing them in storage-pits or cellar-bins. The least abrasion of the skin of fruits will be rot later on, and a speck of rot at this time will mean an entirely ruined product in midwinter, to say nothing of the other products it may contaminate and spoil by coming in contact with them. Reject all of these undesirable products at once, and thus save handling them in a worse condition after you have gone to the trouble of storing them.

Saving the Sunshine.

Most true conservationists will agree with the Secretary of the Interior in his condemnation of those loud talkers who spend their energies in discussing the wickedness of waste without at the same time being willing to assist in any practicable plan to stop the evils they so greatly deplore. We suspect, however, that few, even of those good citizens who believe in the wisest use of natural

IE POOR DYSPEPTIC

Suffers Untold Agony After Every Meal.

Nearly everything that enters a weak, peptic stomach acts as an irritant; ce the difficulty of effecting a cure. Burdock Blood Bitters will relieve all distressing symptoms of dyspepsia in a short time effect a cure.

Mrs. F. C. Gross, Berlin, Ont., writes: I have been troubled with my stomach the last seven years and tried all kinds medicine for it, but none of them ever ed me, for as soon as I would quit ng any of them, the same old trouble uld come back. Last fall I was ad-d to try Burdock Blood Bitters, which d, and used four bottles, and now feel strong I can do all my house work ly and can eat almost anything with-it affecting me in any way.

Our boy is also using it; he always plained of pain in his stomach and over, like rheumatism, and at the age en had to stay home from school. He n't quite used two bottles yet and is ing good, can attend school regularly eats heartily."

ources and who are sincerely eager safeguard the public good both and here-after, realize how easy s to neglect opportunities for con-vation which lie at your door. coal and forests in Alaska are of t importance, but the discharge of duty with regard to them will occupy much of our time. A rer need is to see that we make best use of natural resources in own back yards. How about king "two blades of grass grow re one grew before"? Why isn't t just as important as keeping the l or saving the streams or doing of the thousand and one things t we individually can only talk ut? Our truest conservationists those gardeners and farmers who ch the sunshine and husband the and strive intelligently to keep e in production with the increase the non-agricultural population.

he need of conservation of food-plying resources is obvious. There more people in America every r and every year the soil if unre-lished is impoverished. The area rich land decreases and the cost of ng rises. Conservation of the ential power of sun and soil is the y reasonable solution of the pro-m of nation-feeding and just here our opportunity. What is for the ion's good is also for our individ-profit. The wise use of the soil ans money in our pockets.

he very greatest product of land derived from "intensive garden-." Through generations of intel-nt selection and breeding thor-hbred seeds have been developed se yield far surpasses in quality l quantity that of the ordinary ains. You can be a true conser-ionist if you have a successful den. Be sure, however, to start ht by planting thoroughbred seeds. se can be bought of seedsmen hav-sufficient capital and experience know what they are about and a utation to maintain.

Protect Trees Against Borers.

Young orchards are injured by bor-, rabbits and mice and should be protected against these pests.

A very simple remedy is to take the dirt carefully away as far down as the white bark of the roots and let the tree trunk dry. Then paint it with a mixture of pure white lead thinned to the consistency of cream with pure raw linseed oil. Let the paint dry before replacing the dirt.

But before you paint the trees be sure and dig out the borers with a wire. They will be found near the ground line. Paint the trees a foot or more above ground line.

For young orchards paint in the spring not later than June 15th and in late fall—twice a year for young trees, once a year for older ones, and once in two years for old orchards. The object is to paint the bark as fast as it grows and cracks open.

Caution. Do not use house paint. Any paint containing drier is fatal to the trees. Pure lead and raw linseed oil is safe.

C. P. R. R. Train Shed, Winnipeg, Man.

Train Sheds Test a Roof

The locomotives drive coal-gas, smoke and ashes up against the inside surface—the weather beats against the outside surface. Only high-grade materials can withstand this double attack.

NEPONSET

Paroid Roofing

Lasts Longer than Shingles and Adds Fire Protection

You haven't any train sheds to roof. But like all farmers you have good barns, stables, ice houses and hog houses that need the best roofing material that you can buy at an economical price.

NEPONSET Paroid costs less than shingles both to buy and to lay

While sold in big quantities to leading railway systems and governments, the farmers are our biggest customers. Buy NEPONSET Paroid for your farm buildings and share the advantages of this permanent-wear roofing material that resists fire.

Send for the actual records covering years of hard and long service in the NEPONSET book.

NEPONSET Proslate is the ideal roof for houses—looks like stained shingles—costs less.

F. W. BIRD & SON, **St. John, N. B.**

Champion Evaporator Makes the Best Syrup

Now is the proper time to give your Maple Syrup business serious consideration. By placing your order at once you can have your Evaporator all set up before the cold weather reaches you. This insures taking care of the first runs of sap, which are the most profitable. All up-to-date syrup makers use the CHAMPION EVAPARATOR. Write for booklet.

The GRIMM MFG. CO., Limited, 58 Wellington St., MONTREAL, Que.

PERFECT

Maple Evaporator

Price low—quality high—product the best possible—the kind you like syrup—it retains its maple taste—all unnecessary expense and middlemen's profits cut out. Sold at a price the poorest man can buy. Every one guaranteed. Write for pamphlets and recommends. Do it now.

Steel Trough & Machine Co., Tweed, Ont.

DAIRYING.

Development of the Dairy Cow.

One of the best instructive addresses at the meeting of the Maine Dairymen's Association at Norway, Maine, recently was the address by Prof. P. A. Campbell of the Maine College of Agriculture, on the subject of the "Development of the Dairy Cow." This was the first part of his address, and it should be extremely interesting and instructive to the man who is raising or buying cows. Prof. Campbell is himself a successful dairyman and speaks with considerable authority in these matters because of the careful study he has made in connection with his educational work. Prof. Campbell said:

There are three things which seem to be pre-requisite for a successful dairy cow. These are stamina or vigor, capacity for food, and well developed organs for milk production. The question is sometimes asked what is stamina, and it is hard to reply without illustrating so that anyone can determine whether a cow has it or not. It does not necessarily mean size, for we have seen large cows which were materially lacking in this respect, just as we have seen large people that are not particularly strong and able to withstand hardships. It is necessary that the cow have a good breathing apparatus if she is able to take a sufficient amount of oxygen. This is indicated by a large nostril, a wide breast, and good width across the floor of the chest. Good width here and also a good girt indicate a good heart. It must be recognized, however, that the actual inside capacity is what we are endeavoring to determine and not the outside measurements. Good muscular development will frequently give a good heart girt when in reality the capacity and room inside the thoracic cavity for the heart and lungs is considerably limited. The eye is also indicative of strength and good physical condition of the animal as well as of temperament; a mild, bright eye of good size usually belongs to an animal that is all right in these respects. A strong nerve system also is demanded in a vigorous animal. We sometimes unfortunately speak of the dairy cow as being of a nervous temperament, when in reality it means that she has strong nerves. If we put our hand along the top line of the cow in the region of the chine, we like to find that it is open. If it is, we speak of her as having a good, strong nervous force; in other words, we have indicated that she has got good protection and a good amount of room for the spinal cord to run in. Knowing this, we anticipate that the spinal cord will be large and will carry the nerves well back to the exterior portion of the body so that she will be able to do the work that is demanded of her, for there is a strong relation between the nervous energy of the cow and the work that she does.

The dairy cow that is a heavy producer must have large organs of digestion in order to utilize the large quantities of food necessary to produce milk; consequently we expect the dairy cow that has these qualifications to be wide in the head, with a face dished between the eyes, and to have a strong under jaw. The head should also be of medium length. In the correlation of parts, it has been determined that a head of this character goes with a large barrel capacity of the cow. She should have wide, open, and well-sprung ribs, giving both length and depth to the abdomen. The loin should be wide and strong, and the depth from the loin down to the flank should be good. A light-waisted cow—although she has all the other qualifications which pertain to the true dairy type—is not equal to doing the work of her sisters which are not light at this point. The hips should be wide apart, level, and accompanied by a long, wide, and level rump, with high and wide pin bones. This permits the cow plenty of room in the pelvic region and insures strength and ease at parturition.

The thighs and legs of the dairy cow are of a more importance than is frequently given them by many in selecting their cow. They should be strong and wide at the stifle joint, while carrying a sufficient amount of flesh to give uniformity and strength they should be well opened up between them in order to give plenty of room for the development of the udder. The cow standing with hocks together never can have the room for the udder that the cow that stands perfectly square will have.

The udder should commence well up and should extend down and along the underline until it gradually blends with the underline, thus insuring the greatest capacity of the milk secreting tissues. The veins should be prominent, indicating that a large amount of blood in its circulation is coursing through the udder. The milk vein which extends from the udder along the underside of the abdominal wall should be large, crooked, and long; opening through the abdominal wall in large milk wells; branching veins and those which enter through several wells are desired. In other words, the veins that seem to carry a large amount of blood are the ones that are desired, for there is a direct relation between the amount of blood which passes through the udder and the milk that is secreted. The physiology of milk secretion is unfortunately not well understood, but it is known that the milk constituents are taken from the blood, consequently it is easily seen that the more blood that is passing through the udder, well loaded with material for milk production, the more opportunity there will be for converting it into milk.

During the first few days that may elapse before the fertilized ovum becomes attached to the uterus, it is fed by the food materials carried by the germ cell. From the time of its attachment, the nourishment comes from the dam's circulation; the only influences that the dam now has comes entirely from the blood, and then not by direct circulation but only in the form of nutrition.

The nervous system of the cow is not as well understood as we wish it might be. Anything that will affect the blood of the dam will affect the growing fetus satisfactorily or adversely. With the heifer that has never milked, the growth must be maintained; with the milch cow, aside from food for maintenance, enough nutrients are required for the milk production. The embryo or fetus at the end of the third month is about 5½ inches long; by the end of the fourth month it is about 10 inches long and weighs between four and five pounds. Up to this time it has not been sufficiently large or its demands sufficiently great to prevent the heifer or milking cow from making a normal growth or doing the work required. During the fifth month the fetus increases materially in length and weight, but at the beginning of the sixth it can be seen that if the calf is to weigh 75 pounds at birth, that there is something like 65 pounds of weight to be gained in the last four months, or at least a gain of half a pound per day. This alone would indicate to you the necessity of feeding the heifer well at this time if neither the heifer or the fetus are to suffer. Our milk records show that even the heaviest milkers usually begin to slack off about this time. The cow that has been milking also has another duty to perform for herself; during the earlier lactation period she gradually but continuously has torn down the body tissue in order that she might use it toward production. If then she so that she can go through the same is going to put herself in condition work after calving out, it will be necessary to feed her so that she will put herself in condition. We must continually remember that there are two bodies to support, and that the food should not be cut down too severely when the cow goes dry, but that she should be given enough so that the fetus may make its natural growth and that the cow may be ready to do a full period ol lactation work.

In going over some of our records, we find that the cow that has gone dry, while perhaps not requiring the same amount of food nutrients that she required when milking heavily, still uses an amount far in excess of

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Minard's Liniment Co., Limited

what would be required simply for her maintenance. The birth of the calf changes its form of existence. Whereas, before it was getting its food in a form all ready for building tissue, now now it has to digest and assimulate it for herself. The cow, however, assists for a time by supplying an easily digested and easily handled food for the calf, and if we take this milk which nature intended for the calf, we must give the calf an equal allowance of food nutrients, either in the form of milk or some other form, to take the place of that which it would naturally get from its mother.

During the fetal life the calf has been gradually accumulating in the alimentary tract the general waste of the body. In order to free this, nature has provided a natural purgative in the form of colostrum. Some. times the calf is unable to have this colostrum depending to a certain degree upon the physical condition of the animal. If for any reason this first milk is not available for the young calf, due to the fact that the cow may have been milked regularly up to the time of calving, or milked previous to calving as the result of an abnormal condition of the udder, then some form of physic should be given the calf. Castor oil is usually employed.

The young dairy calf learns to drink readily, and as soon as it is evident that the colostrum has been effective, it is just as well for the cow and calf to be separated, for the results in working the cow to a full production are better, and the calf gets along just as well. It must be remembered, however, that this method of handling the calf is in part unnatural, and that greater precaution must be observed if no setback is to be experienced. One of the greatest troubles is over-feeding at this time. It is also necessary that the temperature of the milk be at about blood heat, or but a degree or so below, and that the calves be fed from clean pails. Some feeders use but little new milk in starting the calf, while others use it for a long time. In our experience the best results have been obtained where the calf was allowed whole milk at least ten days or two weeks. Calves that are fed whole milk all during the earlier part of their life, or are allowed to suckle the dam, make a rapid growth for a time and seem to be ahead of their less fortunate sisters that have to subsist upon skim-milk and rougher feeds; but it has been demonstrated time and time again that they make no better cows or excel in growth. When the whole milk is stopped, it takes them some time to become accustomed to the change, and before they have become accustomed to the change, the others have caught up with them.

If possible, I believe that it is desirable to give the calves more of a chance to rough it than we usually do. Some of the breeders are now growing their calves where they can run out and in at will after the first few weeks of their life.

It has been quite definitely proven that a calf well fed from birth reaches sexual maturity on the average earlier than those scantily fed; however, even under those conditions it varies considerably. The breed also influences it somewhat. It is safe to say, however, that no heifer should be bred to freshen before two years of age. The last three months of pregnancy the heifer does well to maintain herself and nourish the growing fetus, without making any perceptible gain. Consequently, it must be figured that the heifer must be of about the size that you wish to bring her into milk at least three months before parturition. It is possible with the larger breeds to have

Buy an IHC Cream Harvester Instead of Another Cow

FIGURE up the profit per year and the total profit your average cow pays during her lifetime. Then get the facts about the profits an I H C Cream Harvester makes—in extra butter-fat, in extra hog-profits from skim milk, in work and time saved, and in the many other ways, all shown in our catalogues. It won't take you long to see how you could profitably buy an I H C Cream Harvester instead of another cow. The total profits paid by an I H C Cream Harvester will amount to much more.

Keeping cows without a separator is like harvesting wheat without a binder. But you must be careful what you buy. If you want to be sure of getting the closest skimming, easiest turning, and easiest cleaning separator made—choose one in the I H C line—

Dairymaid and Bluebell

These are the only separators with dust-proof and milk-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. These separators have large shafts, bushings, and bearings; the flexible top-bearing is the strongest and most effective found in any separator. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated. I H C Cream Harvesters are made in two styles—Dairymaid, chain drive; and Bluebell, gear drive—each in four sizes—to meet every condition and the need of every farmer. Whichever I H C you select, it will make more money for you per year, and will last longer than any other separator you could buy. The I H C trade mark should be your guide in buying a cream separator. The I H C local dealer will be glad to point out the above features and many others, or, write nearest branch house for catalogues and other information you desire.

IHC Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.

A Des Moines man had an attack of muscular rheumatism in his shoulder. A friend advised him to go to Hot Springs. That meant an expense of $150.00 or more. He sought for a quicker and cheaper way to cure it and found it in Chamberlain's Liniment. Three days after the first application of this Liniment he was well. For sale by all dealers.

them of sufficient size to calve at least by the time that they are thirty months of age.

The way the heifer or dry cow is handled the last two or three months before parturition has much to do with the production after calving. It is evident that the vast majority of the cows in this state are not working up to the point of production that their natural inheritance would permit. The cause of this may be in several directions. In some cases they are not fed a sufficient amount above maintenance; in other cases they are not fed the right proportion; and in many cases the milking function is not incited sufficiently at parturition time. Or in other words, the heifer or dry cow, not being in the producing list, is too frequently given too little thought and care.

With the heifer the milk glands have not been developed; in the dry cow they are dormant. Approaching parturition brings them into activity and growth. The development of these is going to determine to a large degree the production for the next lactation period. If your cow is not well bagged at the time of calving, you cannot expect the best work from her. Although you can help it a little sometimes, no amount of feeding is going to put it where it ought to have been. Consequently the cow that has not been dry for two months or so, or is not in good condition at calving time, is hindered for a full year's work.

The herdsman's duty does not all end here. Some will say that there is more danger from caked udder, milk fever, and other troubles; and such is true. But feeding the cows succulent and cooling feeds will tend to prevent this, and milk fever is not to be feared with the present method of handling it. After calving, the cow should be brought to her full flow as soon as it can be done without injury to the cow.

Here the daily milk records will assist and guide the feeder. Care should be exercised to feed the cow to that point of economical production, and in so doing the feeder will exhibit the utmost skill. Very few cows will respond sufficiently to the point where they are likely to be over-fed when the products are sold at a normal price. To keep the cow working steadily is the next consideration. A shortened food supply and the lessened needs of the offspring formerly were incentives for the milk flow to slacken and finally stop. With a plenteous food supply and common sense, there would seem to be no physiological reason why the production should noy keep up until the next fetus becomes of sufficient size to turn the food nutrients from the channels of milk production to those of its own development.

It may be easy to say how to develop the dairy cow, how she should be bred, and how she should be fed, but it finally resolves itself into a thorough study of the principles of both breeding and feeding, combined with common sense and actual experience of the man that is handling the herd.

Bad Cream in Winter.

Jack Frost will now take charge of the cooling of milk and cream on the farm, and creamery patrons are feeling relieved that this work is taken off their hands. We creamery men do not view the satisfaction of our patrons with equanimity. Of course it is much easier to cool the cream during cool weather and we receive it cooler, but the idea that milk and cream cannot go wrong in the winter time is very far astray.

Cream does not cool down so quickly when it is merely set out in the cool air as when the can is set in a tub of cold water. The germs that have gotten access to the cream,

CURIOSITY Prompted Many Women To Try PURITY FLOUR

THEY were curious to see exactly what results would be produced by flour *consisting entirely of the high-grade portions* of the best Western hard wheat.

They were curious to know more about a flour that contained none of the low-grade portions, which are found in every wheat berry, but which are separated and excluded from the high-grade in the process of milling PURITY FLOUR.

THEY were curious to know whether an ALL HIGH-GRADE hard wheat flour was really superior to a mixed hard and soft wheat flour.

They were curious to see and taste the kind of bread, buns, biscuits, cakes and pies PURITY FLOUR would make.

Curiosity prompts you to seek the knowledge they discovered. It's urging you to try PURITY FLOUR.

REMINDER: On account of the *extra* strength and *extra* quality of PURITY FLOUR it is necessary, for best pastry-results, to add *more* shortening than you are accustomed to use with an ordinary flour. Add *more* water when making bread.

Add PURITY FLOUR to your grocery list right now

PURITY FLOUR

"More bread and better bread"

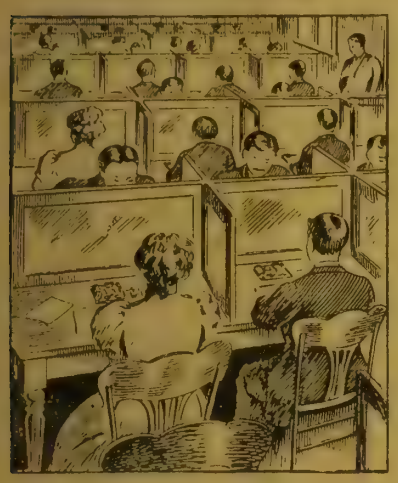
Farmer's Sons Wanted!

To Take a Course at the

G. T. P. School of Telegraphy and Railroading



and prepare for positions as Operators and Agents on the Grand Trunk Pacific in N. B. Big demand. $50 to $75 monthly.

Brother Farmer Got a Good Position.

Mr. George Campbell of Gordensville, Carleton Co., N. B. has been selected and recommended by the "Great Trans-Pacific School of Telegraphy & Railroading," EMPLOYMENT DEPARTMENT, to fill the position as Asst. Agent and Operator at Sherman Sta., on the Bangor & Aroostook Railroad. Word has just been received that he has been transferred to Patten Station, (with an increase of salary).

Station Agents, are provided with Free House, Coal, Oil, etc., in addition to their salary, $55 to $120 monthly. "THINK IT OVER," Can YOU find any better position? Mr. Campbell don't think so.

Another Position.

Mr. Harold G. Meisner, of Springhill, Annapolis Co., N. S., has been selected and recommended by THIS school's "Employment Department," to fill the position as Assistant Agent and Operator at Milo Jct. on the Bangor & Aroostook R. R. What we have done for him we can do for you. Winter term begins TUESDAY, JANUARY 2nd; 1912, residental school. Free catalogue, rates and full particulars, address

W.T. Little, Principal, Fredericton, N. B.

Read the Advertisements in the Maritime Farmer.

therefore, have every chance to develop and produce bad flavors before the cream is cooled. These flavors are bound to show up in the butter. Milk and cream cannot be first class unless the animal heat is expelled quickly.

Another mistake that patrons are making is in delivering their cream at too long intervals. Because cream can be easily kept cool does not mean that it is not deteriorating in value. I believe that cream will rot no matter how cold it is kept.

We creamery men should continue our educational work right on into the winter season. The two points that we need to emphasize at the present time is the necessity for good cooling and also for more frequent delivery at the creamery.—Farm and Dairy.

Bacterial Standards.

For the feeding of an infant with milk nature provides but one way which is perfect. This "perfect" way consists in giving the infant breast milk, the milk of its own mother. As the supply of mother's milk is much too small to meet the demand for infant milk, we are forced to substitute cow's milk for mother's milk. In doing so we encounter difficulties owing to the difference between cow's milk and mother's milk, which are not generally known to the public, but which are well understood by professional sanitarians, bacteriologists, and chemists. Sanitarians who have investigated infant mortality in connection with milk supply are unanimous in declaring that cow's milk is a poor substitute for mother's milk unless it is kept clean and cold, or unless the number of bacteria in it is kept low and the disease breeding varieties of bacteria shut out altogether. One of the several big differences existing between cow's milk and mother's milk, viz. the difference in bacteria, may be readily understood by every layman with the aid of the following simple considerations:

Mother's milk contains hardly any bacteria when it reaches the baby because it is less than one minute old, and because the baby's own mother protects it from dust and from pollution. Cow's milk contains generally thousands or even millions of bacteria in each cubic centimeter before it reaches the babies of the larger cities, because it is frequently 36 hours old, and because it is exposed in milk pails, can's etc. to pollution of various kinds. As bacteria multiply so rapidly that their number is doubled every hour under moderately favorable conditions, it certainly makes all the difference in the world whether infant milk is 36 hours old or only one minute old, whether it is exposed to pollution in pails, cans, etc., or whether it is supplied to the baby directly in the natural act of nursing.

Manifestly, in order to imitate nature and supply the infants that milk which experience has shown to be the best substitute for mother's milk, it is indeed necessary to keep cow's milk intended for infant feeding clean and cold, and the number of bacteria in it as low as possible.

Health Boards are to be praised for fixing a limit to the number of bacteria in market milk, more especially in infant milk, for it is an important forward step in the problem of imitating mother's milk. They are not however to be praised when they suddenly adopt a bacterial standard so severe that a majority of the milk dealers cannot live up to it and so exacting as regards cost of production that it necessarily must raise the price of milk. If, in addition to this, a standard adopted is not enforced or enforced rarely, it operates in the direction opposite to that intended. It spoils the milk supply instead of improving it, since the unscrupulous, the dirty milk dealer is encouraged, while the concientious clean milk dealer dealer is discouraged by the non-enforcement of an existing standard.

Instead of having a law which is too severe to be inforced, it is certainly much better to have a reasonable law and to enforce it effectively. The law should certainly be one which every milk dealer can comply with, and not one which forces him out of business, at the same time creating a milk famine.

A legal bacterial standard should be reasonably low for a year or so when first adopted. We cannot work a great reform suddenly any more than we can stop an express train suddenly by putting a steel bar in its path. We must do it gradually. The city of Chicago adopted a severe bacterial standard three years ago with the result that a fight was precipitated in the City Council and in the public press, in which the milk consuming public who clamored for a cheap milk, backed up the milk dealers to a considerable extent. In the mean time, milk inspection was paralized completely by a suspension of the ordinance fixing the standard.

Other cities can profit by the experience Chicago had. The Chicago limit for bacteria in milk was 50,000 per cubic centimeter in winter and 100,000 in summer. It seems to me that any city which contemplates adopting a bacterial standard should not fix it at less than 100,000 per cubic centimeter the first year. This standard could possibly be made more severe the second year. A more severe standard, say a standard of 50,000, could not be enforced the frst year, or at least not in the summer of the first year.—Hugo Jone.

The "Bissell" All-Steel Rollers

The "Bissell" Roller is all steel except the Pole. It is braced and stayed to stand all kinds of hard work and wear well. The bottom of the frame is all steel too.

The end frame Hangers are formed from bar steel and there is no twisting or warping on "Bissell" Roller frames

The (18) anti-friction Roller Bearings make light draught.

The Draw Bracket and low hitch does away with neck weight.

The Axle revolves with the drums and there is no squeaking or grinding.

The Cages holding the anti-friction rollers are the best yet; they're MADE OF MALLEABLE ALL IN ONE PIECE—no twisting or binding of the bearings on the axle of the "Bissell" Roller. The Seat Spring is reinforced and is DOUBLED AT THE HEEL.

These good features are not all of the advantages of the "Bissell" Roller. Many more good points are built into them, making a Land Roller that is 'built for business," that stands up, against lots of hard work.

FREE

Handsomely Decorated Dinner Set

Ladies. We will give you this beautiful full size dinner set absolutely without cost.

This is the Chance of a Lifetime. An Honest Proposition.

We will give away free 1,000 of these handsome dinner sets, beautifully decorated, each set 58 pieces, latest designs, handsome patterns, full size, for family use. A magnificent and complete set to quickly introduce and advertise Dr. Burdick's famous New Life Vegetable Pills,—the wonderful remedy for indigestion, constipation, unhealthy blood, rheumatism, to stimulate the appetite, regulate the bowels, and clear the complexion, an invigorator, tonic, and life builder. We will make you a present of this handsome set exactly as we claim. Take advantage of this if you want to get a handsome set of dishes for your home, absolutely free.

All We Ask You to Sell is Only 12 Boxes at 25c a Box

of Dr. Burdick's famous New Life Vegetable Pills. Being determined to gain a national reputation as the most progressive firm in Canada, and to gain a wider distribution of our strictly pure, high-grade remedies, we are going to assist you to sell our medicine, and to earn this beautiful set quickly by sending with each box of pills a certificate by which every purchaser can receive from us a Handsome Box of Presents consisting of 1 handsome solid gold shell ring, plain engraved, and chased or set with beautiful sparkling jewels, equalling in appearance the finest diamond rubies and sapphirs, etc., 1 sacred Resurrection Plant of Egypt—The Rose of Jericho as spoken of in the Bible; 1 pair gentlemen's imported Lever Cuff Links, Gold finished, your choice of a handsome Silver finished Sugar Shell, silver finished Butter Knife or Silver finished Pickle Fork; one cabinet photograph of our King in his royal uniform, and our Queen in full court dress. This magnificent box of presents, exactly as described, we will send fully prepaid to every one who purchases a box of our medicine from you, and will return us the certificate with only 50c. to cover cost of packing, mailing, etc., the different articles. Our object in making this wonderful offer is to induce people to try our medicine, and to receive the opinion of every purchaser, and this we will get when the certificate is signed and returned to us. This liberal offer makes it impossible for you to fail. Your friends will be delighted with this wonderful opportunity to secure a handsome box of presents.

Don't miss the opportunity of a lifetime. Write us to-day and agree to sell only 12 boxes, and return the money, only $3.00 to us. We trust you with our medicine till sold. As soon as your remittance and the certificates have been returned to us, we will promptly ship the dinner set to you. We arrange to stand payment of all freight charges to your nearest station. We are bound to introduce Dr. Burdick's famous medicine no matter what it costs us and when we say we will give away these handsome sets of dishes, we will do it. **Our methods are honest. Don't miss this great opportunity.** Write to us at once. Address.

LIVE STOCK.

Sheep Raising in Newfoundland.

Editor Maritime Farmer:—

I have been requested to write an article on Sheep Raising, so I will begin by giving you some quotations from high authority.

"No animal in existence has the power to adapt itself to local conditions like the sheep."

"The world is short of sheep and no other farm animal presents such profitable inducements."

The Islands of Cape Breton and Newfoundland are each famous for the production of a superior flavoured mutton. The cause of this is to be found in the pasturage; there are certain grasses indigenous to these islands which produce this peculiarly high flavoured mutton.

We are only a few miles distant from London and if in the course of time we should produce a surplus of mutton we have the easy outlet of a frozen meat trade.

New Zealand sends annually, over one hundred and eighty degrees of longitude, no less than 5,000,000 carcasses of mutton to the London market.

The sheep gives the best results when domesticated. No animal more readily becomes a "pet." A handful of salt, a piece of turnip, or the rinds of potatoes will bring a sheep home regularly every night to the fold. Sheep so treated, seem to thrive better and produce better fleeces than those which remain throughout the year away from the habitations of men. Wild hay and rations of turnips will bring sheep through the winter in good condition. In spring the ewes will be strong and have abundance of milk. The lambs will be strong and fit for the early market.

Sheep require a comfortable shelter so constructed that they can go in and out as they choose. In cold dry weather they prefer to lie outside at night but in stormy weather they prefer to stay inside the building.

The dog is the deadly enemy of the sheep. It seems as if a dog had a conscience in everything but the sheep. Some of the best sheep farmers in Canada have been compelled to give up their flocks on account of dogs.

If people would only think the matter over for a little they would come to a rational conclusion.

I was a great dog fancier during all the early part of my life but latterly I find that one of my dogs helped to destroy some sheep belonging to my neighbour. I had the dog shot and procured another one, shortly I found this dog guilty of the same mischief. I had this dog shot also and since that have not owned a dog. Now I have changed my mind. I consider a dog a nuisance I find that I do not require him as an assistant, an associate or in any other capacity.

The Woolen mills have been established in St. John's in connection with a policy of prompting Sheep-raising in this colony. The industry will create a ready and profitable market for all wool that may be grown.

A further result will be that all kind s of woolen clothing, blankets, hosiery, etc., will take the place of cheap cotton goods. The people will be able to substitute the best woolen blankets for the thin, useless articles that are imported into the colony. Good health-giving woolen underwear will take the place of cheap fleece-lined shirts which are made from the cotton waste swept up in the big American mills and dumped into this market.

It will be the object of the Company to supply at reasonable prices the very best of woolen goods the most of which will, in due course be made from wools produced on this Island.

The economical value of increasing the industries of the country can hardly be estimated. No country can be truly prosperous which subsists on a single industry.

What has built up the American States? Industries. Wherever you travel there you will find avenues of employment opened up for the people. Push, perseverance, and prudence are characteristic qualities of any progressive country. Newfoundland possesses these qualities. Progress. Progress is the watchword of this country to-day. The establishment of the Woolen Mills here is one of the many proofs of this. These large mills, situated in the most thickly populated district of St. John's West will afford employment for many in factory, office, store and shop. The encouragement given to Sheep-raising will increase the quantity of mutton, lower the price, and thus lower the cost of living, which is certainly a necessity now that beef is so scarce and therefore in great demand, and so high in price that it is beyond the reach of many and is one of the causes of the prevalence of tuberculosus. Sheep Raising will help in many ways, and it needs and deserves to be encouraged at once, especially in St. John's. What is happening now? Each year more fish is being sent direct from the outports to foreign markets, and now American companies are buying it up in the outports so that a lesser quantity will reach St. John's each year, and less cash also, from this source, because more large firms are starting in the outports each year and importing direct, therefore the people of St. John's should favour the starting of more industries here to give employment to the people—their only hope. The Woolen mills is one of these and even this cannot prosper if people refuse to encourage the Sheep Raising industry by keeping destructive dogs in their possession. I would go so far as to say that not only would the majority of the people outside the municipality of St. John's sign the petition, but the majority of those in the city, and why not? If it is fair to kill the poor man's dog in the outport it is equally fair to kill the rich man's in the city. If these dogs which are kept for watch dogs are not kept chained they will have to go too, that is certain—the first offence will be sufficient cause for the starting of a petition in the city as well; but so far there has been no cause.

No one admires a dog more than I do. I could fill this paper writing on their merits, their faithfulness, sagacity, and nobleness; but sentiment must give way to necessity—to "bread and butter" for the people.

Many fishermen will resent the killing of their dogs without compensation. In the case of Petty Harbour they would have just cause. There are no less than 400 dogs there used solely for hauling wood in the winter—a proof of their great need. To kill the dogs in this settlement is just as bad as to kill the ponies in Torbay, and would be just as hard on the people. These people should be helped to provide ponies instead. I feel sure the Government will be prepared to back up the people of Petty Harbour in this matter. They should be given one pony for every four dogs or a sheep for a dog, and they will if I can help it, before one of these dogs is shot, but someone should move in the matter in the interest of Petty Harbour, at once, before further steps are taken. Again the skins of the dogs are worth something for coats, and the carcasses for fertilizer. In the past the economic side of this was entirely ignored and the carcasses were allowed to decompose. Not so in this case. Already a large fur manufacturing house in Canada is ready to buy, not 400, but 4,000 dog skins if they can be procured, and the money realized should go to the people who own the animals in addition to ponies and sheep. A few years ago the people along the South Shore of Conception Bay were contented with dogs; but as soon as these dogs were shot they quickly got ponies, and to-day they are an independent and successful people, owning not only ponies but carriages and live and travel in comfort. They can thank those who signed the petition.

The people of Petty Harbour will be able to do the same. I don't believe they will object when they see how it will benefit them. Again, how much this will save on fish. At present they have many quintals of fish, worth $6.00 a qtl., destroyed by dogs each summer, and they have to keep the dogs as idle expense for the sake of hauling the wood in winter. Ponies would not cost as much to keep because they would feed among the hills; dogs do not except when they can get sheep to eat, and if they get hold of any of the Society's sheep, of course these will taste so good to them, they will eat nothing else—a rather expensive luxury. The conclusion is that St. John's West must either "go to the dogs," or vote for the sheep. Which will it be? The petition will answer the question.

As the law stands a majority of the people in any place, places or district can do away with dogs by merely signing a petition for the purpose. The St. John's Agricultural Society with its 3,000 members could carry this out within a week; but they are not going to do so, they prefer waiting until after the winter to give people their chance and to try and convince people that sheep and ponies would be more profitable for them and all concerned and if possible secure some alternative for them first. This is very reasonable and just.

A sheep for a dog would be a good exchange. Supposing a man has four hauling dogs he receives four sheep for them; these and all he could rear afterwards would bring him in $8 or $9 each and at least $56.00 in one year; this would pay him well, not to mention the benefit of having a good frozen carcass of mutton for Christmas besides from his fold every year. Attend the annual meeting of the St. John's Agricultural Society in January next and vote for sheep; then ask the Government to be preuared to help out this great industry extensively throughout Newfoundland.—P. G. Butler, St. John's, N'f'l'd.

3 FEEDS FOR ONE CENT
This is all it costs you to keep your stock in prime condition with the world's most famous animal tonic—
International Stock Food
Every cent invested in this wonderful health-giver, brings back dollars in strong, healthy horses, cows, sheep and hogs.
Careful tests show that 4 quarts of oats and the regular feed of INTERNATIONAL STOCK FOOD will keep horses in better condition than FIVE quarts of oats without it.
INTERNATIONAL STOCK FOOD will make your cows gain 1 to 4 quarts of milk per day.
Nothing like INTERNATIONAL STOCK FOOD to fatten animals for market. Your hogs need it. Ask your dealer for it.
We have a copy of our $3,000 Stock Book for you. Send us your name and address, and tell us the number of head of stock you own.
TESTIMONIAL
Mayfield Sta., Man., Nov. 15, 1911.
International Stock Food Co. Ltd.
Toronto, Ont.
Dear Sirs.—I want to say that your Stock Food is all right. I have had more good from its use than any other kind I ever used, and do not care to start winter feeding without it. Please ship as soon as you can to Carroll. Yours very truly (signed) JOHN ROGERS
INTERNATIONAL STOCK FOOD CO. Limited

THE SIXTEENTH

ANNUAL CONVENTION

OF THE

NOVA SCOTIA FARMER'S ASSOCIATION

WILL BE HELD AT

YARMOUTH, N. S.

OPENING

Tuesday Evg., January 23

at 8 o'clock, continueing in session Wednesday and Thursday, January 24th and 25, 1912.

A full and interesting programme is being prepared.

Return fares at single rates are arranged for on the Standard Certificate plan.

CHAS. R. B. BRYAN, Durham, N.S.
Secretary-Treas.

Prominent Guernseyman Praises Tuberculin Test.

One of the strongest arguments ever made for the tuberculin test, rightly applied, is to be found in the experience of William Nicholls, a Wisconsin breeder of Guernseys. At one time this well-known stockman shared with many others in the belief that physical condition alone was a sufficient index of the health of an animal. But his indifference or lack of faith in the test cost him several thousand dollars for, in all, he lost twenty-one splendidly bred cows and three equally good bulls. Coming early in his career as a breeder and at a time when he could little afford to meet it the loss was a heavy tax upon his resources.

Mr. Nicholls' difficulties came about in this manner: Believing that the future of the breed, which he had adopted to follow, particularly bright and desirous of enlarging his then small herd he purchased a consignment of cattle from a Minnesota breeder who was retiring from business. Application of the tuberculin test was not required for the herd seemed to be in excellent condition physically. The state had not as yet passed a law prohibiting the introduction of cattle which had not been tested for tuberculosis, for as Mr. Nicholls himself has since said, "Wisconsin was not at that time protecting its buyers who did not protect themselves."

The Minnesota purchases were turned in with the home herd and with it were housed in a well lighted and ventilated barn. "The cows," said Mr. Nicholls a short time ago talking to a group of fellow Guernsey breeders, "did very well and I notic-

ed nothing unusual about them other than that one cow was somewhat lame in a hip joint and that another of the older cows was coughing considerably."

"About eight or nine months after making my purchase I priced six of the cows to a man who had more foresight than I had shown when I was buying for he asked that they be tuberculin tested. This I readily agreed to do not fearing but what they would pass the test for I had sold several of my own breeding a year previous which came through the test in fine shape. To my surprise, however, and, I think, to his as well, five of the six cows reacted. I studied the situation for a time wondering if the test was reasonably accurate and wondering also, if any of the reactors would ever show any physical effects of the disease.

"Postmortem examination confirmed the findings of the test and, then and there, I determined that I would test my entire herd, in order that I might rid it of any possible affection. To my utter astonishment I found that nearly all of my cattle were tuberculous, only four or five cows and a few of the young things passing the test. These were placed in a smaller barn and the two herds kept separate. As most of my cows were valuable I decided to keep them until they dropped calves and in the meantime I would have an opportunity to watch the workings of the disease.

"I had but a short time to wait, for soon some of the cows began to break down, among the first being the cow that had coughed so much. In the next few months the disease began to manifest itself in various forms throughout the herd. Some of the animals became emaciated. One heifer, in splendid condition when I purchased her, dropped away in about a month's time to a mere skeleton, and another had the lymph glands of the neck so swollen that it became necessary to kill her; two or three others were going about with swollen hind legs and another was lame in the hip showing the presence of the disease in that joint. As soon as a cow showed these physical signs I killed and buried her unless she was very close to calving. Funerals were frequent on my farm those days and I was so thoroughly disgusted that I resolved unless I could clean up my herd and keep it clean, I would forever quit the cattle business.

"The calves were taken as soon as dropped and placed in clean quarters and were fed on the milk from these tuberculous cows after heating it above 160 degrees Fahrenheit. Some of the cows were quite emaciated when the calves were dropped but the calves were apparently thrifty, and I wondered if the Bang system, advocated in this country and so much practiced in Denmark, would work out all right in my case. (It was entirely successful for not one of those calves ever reacted to the test while remaining in my herd.)

"As most of my cows had dropped calves, and being tired of burying animals one or two at a time and completely disgusted with having anything to do with a tuberculous animal, I asked the state veterinarian to test my entire herd and condemn every reacting animal so that I could once more be free from this pestilence. As a result two or three in my 'clean' herd and, I think, with but one exception, all in my tuberculous herd reacted. This exception was a cow that I had previously tested, and as she had shown a pronounced reaction I asked the veterinarian to condemn her with the rest that we might hold a postmortem examination. This we did, and found that not only were her lungs affected but her udder was in bad condition as well. It should be remembered that there is much more danger in passing an animal in the later stages of the disease as healthy than there is in condemning a healthy animal. Had I not previously tested this cow she would have been passed as healthy and would have become a source of infection for my new herd.

"After burying the 21 cows and one bull (I had previously lost three bulls, one of them a son of the great cow, Auricula 2d, and another a son of the well-known bull, Benjamin,) I proceeded to disinfect. Everything removable was taken from the barn and both formaldehyde and chloride of lime were used freely. The job was thoroughly done and we later whitewashed, put in cementfloors and installed the healthy herd.

"I have made a practice of testing about once a year since the loss of my original herd and it is now six years since I have had a reacting animal. I have purchased many animals to add to my herd but have always tested them myself, and until a year ago never came across a reacting animal. At that time, in a herd supposed to be free from the disease, although, untested, I found a cow whose temperature went above 105 degrees, and of course I did not want her.

"My experience covering quite an extended period of years gives me almost complete confidence in the test. I recently tested forty-eight head above six months of age and in the past six years the aggregate number of tests in my herd has been upward of 200 without one reacting animal, which gives me confidence that an animal free from tuberculosis seldom shows a reaction. However, should I now have an animal respond to the test and I was sure she had not been exposed to a source of infection I would put her in isolated quarters and hold her for a second test. I believe that such a course would be advisablewith all valuable animals whenever any doubt exists as to the accuracy of the test.

IT MADE A MAN OF ME

Read what Mr. Isaac Soule, Granby, Que., says, who was cured of Catarrh of bladder, at age of 70:

"Dear Sir,—Your Belt has done me more good than all the drugs I have taken. I would not have lived much longer if I had not got it when I did. I just received it in the nick of time. It did me good from the start to the present and has, I believe, cured me of my ailments. It was a Godsend to me."

Mr. V. E. Brazeau, Box 66, Sturgeon Falls, Ont., writes:

"Dear Sir,—Since wearing your Belt, I have been in far better health than I ever was before. It did me more good in three weeks than all the drugs I ever took and the old symptoms have never returned, as I expected they would. It has certainly built me up in every respect. I consider that your belt saved my life I tell every one I can about your Belt."

Mr. Wm. Honan, Cochrane, Ont., expresses his feelings in these words: "Dear Sir,—I cannot say too much for your Belt. I consider it completely cured me of Rheumatism and I never felt so well for the last thirty years. I would recommend it to any Railroad man suffering from weak back or kidney disease. I only wore my Belt for one month."

Letters like that tell the story which means a good deal to a sufferer. They are a beacon light to the one who has become discouraged from useless doctoring. I get such letters every day.

Give me a man broken down with dissipation, hard work or worry from any cause which has sapped his vitality. Let him follow my advice for three months, and I will make him as vigorous in every respect as any man of his age.

My Belt has a wonderful influence upon tired, weak nerves. It braces and invigorates them and stores up a great force of energy in a man.

Are you weak or in pain? Are you nervous or sleepless? Have you Varicocele.. Rheumatism, Weak Back, Kidney Trouble, Weak Stomach, Indigestion or Constipation? Are you lacking in vitality? I can give you the blessing of health and strength. I can fill your body with vigor and make you feel as you did in your youth. My Electric Belt is worn while you sleep. It gives a soothing, genial warmth into the body. This is life—vigor.

After you read the above, write to me, explain your case, and I will at once tell you if I can cure you or not. To prove to you the confidence I have in the curative power of my Belt, I am willing to accept your case, and

AFTER I HAVE CURED YOU, THEN PAY ME

All I ask is reasonable security You may then use the Belt at my risk.

Tell me where you are, and I'll give you the name of a man in your town that I've cured. I've got cures in every town. That's enough. You need the cure. I've got it. You want it. I'll give it to you or you need not pay a cent. Come and get it now. The pleasurable moment of this life, are too few, so don't throw any away. While there's a chance to be husky and strong, to throw out your chest and look at yourself in a glass and say: "I'm a man." do it, and don't waste time thinking about it.

CALL TO-DAY

Come and see me and let me show you what I have, or if you can't, then cut out this coupon and send it in. It will bring you a description of my Belt, and a book that will inspire you to be a man among men; all free.

M. K McLAUGHLIN

214 St. James St., MONTREAL, QUE.

Dear Sir,—Please forward me one of your books as advertised.

Keeping the Flock Healthy.

There is nothing so important in connection with the sheep business, or especially the management of the farm flock, as to keep all its members in good, healthy, thriving condition. If the owners of a few sheep on the farm would give them one-tenth the attention in the matter of observance as to their health that they do their hogs there would be less complaint of the sheep not doing well or that "one of the sheep died; they seemed all right ten days ago, the last time I noticed them, except one looked a little thin and humped up more than the others."

All animals on the farm, it makes no difference to what class they belong, need the trained eye of the farmer every few days to see that they are all right, that there are no ailments of any nature started among them. It is especially true among sheep; lambs just after weaning are often troubled with parasitic ailments that are easily corrected if taken in time.

A stupid lamb, a thin lamb, one showing evidence of being purged or having slight attacks of scours, can readily be relieved by giving a few doses of turpentine and raw linseed oil, or crude castor oil, equal parts. A teaspoonful of this mixture is a dose for a lamb; a little larger dose should be given a grown sheep. This treatment is frequently effective by giving one dose only, but a safer course is to give a dose each day for three days, then give the animal ten days to determine whether it needs the treatment repeated. Ordinarily the three doses will cure all parasite ailments; stomach worms, intestinal parasites or lung worms—a very common ailment among young sheep in many localities all over the sheep-raising districts.

When a sheep indicates that it is not doing right, catch it and make an examination for the trouble, and if you cannot find any special evidence just try the turpentine and oil treatment, and nine times out of ten your patient will show indications of improvement in a very few days! Don't be afraid to use this same treatment, only in larger doses, on your pot-bellied calves and colts that have been neglected and become the subjects of parasite ailments.—G. W. Hervey.

The Calf.

Never let the calf do the first milking, it gets the calf into bad habits, and it can not do a good job anyway. The cow will do better if she is milked by hand.

There is something in the first milk that the calf needs, and should have.

It is easy to teach a calf to drink before it sucks. Remember the sign is always right when the calf is hungry.

Keep your calves in clean separate pens for about four weeks, and then if the weather permits, turn them out with the herd, and they will not suck the cows, or the other calves ears.

Fall calves grow about as much in twelve weeks as the spring calves would in eighteen, is an assertion frequently made.

The calf born in the fall does not have to wage the ceaseless war against flies that the spring calf does, while the cooler temperatures prevailing causes the milk to be in better condition. Scours are a rarity in fall or winter.

During the first few months the calf must be fed on milk, and considering the fact that fall calves make much larger gains, it is better to breed the cows so as to freshen in September or October.

The increased prixce of the feed will more than be offset in the greater value of the animal raised. An additional incentive would be the fact that fall bred cows gibe a longer and more profitable flow of milk. It has been noticed that milk fever very rarely occurs in fall.—W. A. Freehoff, in Successful Farming

THE HORSE.

Soil Character in Horse Breeding.

There is no point which is of more vital importance to success in breeding horses than that the land on which they are reared should be of a suitable character for the purpose. This, in fact, constitutes the chief fundamental requirement in horse breeding as all experienced breeders will agree. The nature of the soil plays a great part in molding the type of horses, their size, the development of their bone, and their general conformation are all very largely influenced by this factor. And not only does it have a bearing on their outward type, but their whole inward quality—their constitution, the quality of texture of bone, toughness or otherwise of sinews, etc.—are also affected by it to a material extent.

The requirements of horses as regards the nature of the soil vary according to their breed. A soil which is suitable for one class of horse may be quite unsuitable for another. When the conditions of soil are not congenial to its particular nature, a breed cannot flourish, and sooner or later loses its type or actually degenerates. For this reason, horse breeds do not bear being indiscrimately transplanted from one kind of soil to another. Yet the mistake is commonly made of attempting to breed a particular class of horses on land totally unsuited to its character.

For instance, heavy and massive Shire horses can be raised only on rich and fertile land of a heavy character where the grazing is of the best, as well as very abundant. Such horses cannot be bred on lightish soils, because the grazing on these lacks the elements which are necessary for the production of this type. Transplanted on to light land, Shire stock quickly deteriorate in size and weight, and the true type, with its massive proportions and powerful build, is gradually lost. Cart horses bred on this kind of soil are always on the small side and of a lightish stamp. Their weight and size in fact bear a direct and close relationship to the richness and fertility of the soil. The richer the latter is, the more does it promote the development of these characteristics. The heaviest and biggest Shire draft horses are bred in the low-lying marshy and rich lands of the Fen country in Lincolnshire and Cambridgeshire, which kind of soil favors the production of extreme weight and a huge framework to a greater extent than any other kind.

"In the case of the light breeds of horses also, richness of soil tends toward massiveness of shape, just as it does in the case of cart horses. But the requirements of this class of horses regards suitability of soil are, of course, of a different nature. The biggest and most powerful light horses can be bred on soil which would not be suitable or good enough in point of richness for producing weighty and first-rate Shire horse stock. Moreover, the marshy, low-lying, rich pasture grounds, such as are found in the Fen districts and elsewhere, which are so admirably adapted for raising heavy draft horses of the light class, while some light breeds cannot be bred successfully on them at all. For instance, they are suitable for raising thoroughbreds, or stout and tough hunters or polo ponies. Light horses bred in this class of soil, it is true, develop much weight and grow to a big size as a rule; but they are more or less coarse in type, and lack the quality and refinement which one looks for in well-bred animals, while invariably they are more or less soft in constitution. Furthermore, the quality of their bone and sinews is of an inferior character, these structures being deficient in toughness; and this last applies also to their feet, which generally incline to be of a flatter shape and more spreading than one likes to see in horses of the light class which are worked at fast paces and whose feet consequently are sublected to a great deal of concussion. Really tough, hard-wearing and stoutly constitutioned, light horses with strong legs, steely tendons and good feet, can be bred only on uplying pasture lands,

"In no other direction does the nature of the soil exert a greater degree of influence on the horse bred on it than it does in regard to the size and quality of the bone, and also the quality of the structure intimately connected with the bone—namely, tendons, sinews and ligaments. The principal ingredients which go to build up the bones are lime and phosphates; hence, where the soil is deficient in these important constituents the feed it produces does not contain a sufficient amount of bone-forming material to assure a full development of the bones in young horses, and under these unfavorable conditions they naturally remain light-boned and weedy. It is impossible to breed big-boned horse stock on such land.

The quality of the bone also varies on different kinds of soil. Some soils tend to produce dense, tough and finely-textured bone, more or less ivory-like in its substance; while on others the tendency is for the bone to be of an inferior character, porous, soft and of a coarse texture, although it may at the same time be abundantly developed. Quantity and quality of bone, in fact, by no means always go hand in hand. The quality of the tendons and ligaments is in all cases most closely associated with that of the bone. When the latter is flinty, flat, and ivory-like, the former structures are of an equally good quality, and possess toughness and strength, so that they are found to wear well. And similarly, when the bone is poor in quality, coarse, and with a tendency to roundness, instead of being nice and flat, the sinews are also inferior, and do not stand wear well, being neither strong nor tough.

Of the various kinds of soils, no other is so favorable to the development of big bone—and that of the very best quality—as a good limestone soil. This is admittedly the most suitable for the breeding of good horses, and especially of light horse stock of a tough and hard-wearing sort. Our stoutest and best horses are bred on land of limestone formation.

Trotting a horse fast down long and steep hills will in time cause him to become knee-sprung, but don't expect that trotting him up the hills will counteract this tendency or straighten the already sprung knees. A change of gait on the road is always easier on the horse, and if he trots on level roads, he surely deserves to walk up and down the hills.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:
SPLINTS
CURBS
SPAVINS
ENLARGEMENTS
COUGHS
COLDS
DISTEMPER
GLANDERS
FOUNDERS

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,

RODERICK McKENZIE.

DEAR SIR:--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

"After Effects" of Fertilizers.

Extract from

"Record of Fertilizer Experiments."

By Walter Shipley.

Sometimes, owing to adverse weather conditions, either extreme drought or excessive rainfall, the application of even a complete fertilizer does not give a profitable increase during the first season. In such cases it must be borne in mind that the Potash and Phosphoric Acid part of the fertilizer, not used by the crop that year, is retained by the soil and invariably has a marked beneficial "after affect" on the succeeding crops for two years at least. A practical example of this is shown in a letter received this fall from one of our experimenters, Mr. Harry A. Acheson, Elmsville, N. B.

The following is an extract: "I might make mention of the "after effects" of the fertilizers. On plots Nos. 2 and 3 I have a fine catch of grass seed but practically none on Plot No. 1 (unfertilized). This is on the plots where I sowed oats this season. Where I raised potatoes two years ago, applying the fertilizer in the drills, no difference could be seen between the plots owing to the dry season, but last year I had a fine crop of oats. This year I cut a splendid crop of clover and to-day the rows are there to show where the fertilizer was applied in the drills two years ago."

POULTRY.

11 Annual Meeting Maritime Poultry Association.

he 1911 Annual Meeting of the ritime Poultry Association was d in the Board Room of the Win- Fair Building, Amherst, N. S. on cember 6th at 2.30 p. m. J. P. ndry, president of the association upied the chair. About thirty en- siastic members were present. e Secretary read the minutes of last Annual Meeting and they e approved.

he President referred in feeling ms to the loss sustained by the ociation in the death of the faith- co-worker, Mr. Wm. Robertson. e increased number of exhibits in Poultry Department had taxed cooping capacity and the time l arrived when a double decking tem of cooping must be arranged, ess some other provision can be de. In future any new coops that ght be needed to accomodate the ltry exhibit must be paid for out the funds of the Poultry Associa- n. The quality of the exhibits in Dressed Poultry Department was ter than in previous years but re was still much room for an in- ase in point of quantity.

he Maritime Stock Breeders' As- iation was bearing all the expens- of the Show and it was only fair t the Poultry Association help m with their work by handing ov- to them at least fifty cents out of h and every membership fee.

he Treasurer's report showed a stantial balance on the right side the ledger after all expenses had n paid.

C. Craig, Director for Nova Sco- said he would like to see more mbers present at the Annual Meet- . There was strength in numbers it should be the duty of every mber to be present.

eth Jones, reported for the Prize t Committee. Nothing had been e towards extending the prize list include Pet Stock as the object of Fair was to increase the interest Utility lines rather than in fancy s. He also explained the placing the Silver Cups and told why the nge had been made.

r. L. H. D. Foster, another mem- of the Prize List Committe, had been present owing to not receiv- notice of meeting in time to make essary arrangements re his busi- s during his absence.

Mr. L. A. Haszard did not think the Prize List Committee was justified in changing the conditions under which the Poultry Association's Cup must be won. Messrs. Foster and Burke sustained Mr. Haszard's views. Several other members spoke to this question and upheld the Committee's action as they had two Cups at their disposal and as the last year winner of the cup had withdrawn from the show ring no intentional injustice had been done to anybody.

The Prize List Committee's report was then voted on and carried.

J. B. Daggett, seconded by I. C. Craig moved the adoption of the following resolution:—Resolved that when a Cup has been awarded for competition for a series of years, no change shall be made until the series of years in conditions have been completed. This resolution was unanimously approved.

The President reported that the prize ribbons had been received from the Rhode Island Red Club.

Mr. Fuller explained that owing to matters over which he had no control, he had to call the Prize List Committee together on short notice.

The old question of properly and expeditiously indicating the owners birds as soon as the judges had completed their work was again brought before the Association and on motion Mr. Seth Jones was appointed a committee to devise a workable scheme.

Mr. J. B. Daggett was appointed a committee to interview the powers that be in regard to getting a grantfor the furtherance of the Poultry Industry in the Maritime Provinces.

Mr. Craig asked that the resolution passed last year asking that the wording of the conditions governing pens of poultry be changed so that cockerels might be penned with hens and cocks with pullets, be again brought to the notice of the Prize List Committee.

Mr. Daggett spoke of the excessive express charges exhibitors from points west of St. John must pay but thought the proposed Valley Railroad would alleviate the difficulty as soon as transportation was established over that route.

Mr. Haszard thought exhibitors should know who the judges were before they left home. He thought Island Poultry Men did not receive a square deal in this matter. In reply the president said it was impossible to give the exhibitors this information and he did not think it was at all necessary.

Referring to the matter of alleged unfairness, Mr. Daggett said the members of the Association ought not to indulge in any sectionalism or provincialism. It was a mistake to do so, particularly when these grievances were more imaginative than real. The members should all work in harmony and talk of the various provinces in the collective spirit.

I. C. Craig moved a resolution that a letter of condolence be forwarded to the wife and family of the late Wm. Robertson and that it be incorporated in the minutes of the meeting—carried.

The election of officers resulted as follows:—

President—L. H. D. Foster, Marshfield, P. E. I.; Vice-Presidents—W. H. Henry, Shubenacadie, N. S.; S. Jones, Sussex, N. B.; L. A. Haszard, Charlottetown, P. E. I.; Directors—I. C. Craig, Amherst, N. S.; P. P. Gunn, Sussex, N. B.; A. Boswall, French Fort, P. E. I.; Geo. Kaulback, Summerside, P. E. I.; Prize List Committee—L. A. Haszard; S. Jones; J. P. Landry; Sec.-Treas.—J. P. Landry.

Keep Fowls Confined.

Reasons are often given why it is most profitable for the farmer and all other poultry keepers, to have their fowls confined to yards instead of running at large. Now we will give one reason why it is better for the consumer of eggs and poultry that they should do so. It is the same which we once heard a man give for wanting his hens let out instead of remaining confined in the yard: "When the hens are let out they pick up lots of feed, and eat just what suits them best."

Now in the matter of choosing her food, the hen has neither wisdom nor good judgment. She will eat anything that is fit to eat and many things that are not. Nothing is too filthy nor too disagreeable in flavor for her. She seems to lack the senses of taste and smell. Not having tried them, we will not say that the ordinary bugs and worms, butterflies anf grubs are not as good flavored and wholesome as beef-steak, but she would as readily eat meat in the last stages of decay and take her water from the drainage of the barnyard or cesspool as from the purest brook.

We always had some sympathy with the young lady from the city, of whom it was said that she declined chicken at the dinner because she had been watching them at work in the barnyard, and she preferred a piece of the tripe insted.

Whatever may be the cause, and we think it is this lack of discrimination in feeding and drinking, we know that the egg of the hen or the flesh of the chicken that has an unlimited range on the farm has a rank flavor usually which makes it far inferior to the product of those which are yarded and fed with a suitable variety of feed all of which is selected as being sweet and wholesome.

Everyone may not notice it, as we have heard some say they could not tell the difference between a fresh-laid egg and one that had been kept three weeks, or, if in cold storage, lor months possibly. Luckily all people are not alike in their tastes.

Increase the Prolificacy of the Flock.

Every poultryman should endeavor to increase the prolificacy of his flock.

How can this best be done? By breeding in line for the best results. If egg production is the desired end trap nests will determine the best layers. A system of marking the chicks and pedigree record will determine the progress of the flock. Egg records and receipts for the marketed product as well as the grain bills will assist the keeper to estimate the profit.

No poultryman in this day of competition and small margins can afford to keep hens without a definite knowledge of what his flock is doing. Nor can he afford hens without following some system of mating and pedigreeing. No one keeping hens for profit can afford to stay in the business without a knowledge of which his best layers are. There is no doubt but what thousands of people keeping hens are in the dark as to their most profitable fowls. Such people cry: "There is no money in hens." There would be no money in any business unless managed with extreme care and intelligence. The thing to do is for one to manage the poultry business with the same skill as he would manage any other business.

By careful and proper mating for a number of years any intelligent person can build up a strain of fowls that will pay a profit nearly double that of an ordinary flock per fowl.

The Christmas Tree.

It blooms one day in all the year
Not when the roses blow
But when the fields are brown and sere
Or robed in gleaming snow.

Upon its branches bending low,
All beautiful to see
Both flower and fruit together grow,
Oh, wondrous Christmas tree!

And children dance in merry glee
And lovers whisper vows;
And trembling age draws near to see
And rest beneath its boughs.

And up above, in starlit space,
Beyond the gates of gold,
Perchance through all the heavenly place,
Rolls round the song of old.

"Peace on the earth—to men good will,"
That sweet and glad refrain—
Should not the angels sing it still
When Christmas comes again?

Green be thy branches, Christmas tree
Thou plant of heavenly birth,
Thou hast the summer's heart in thee
Though winter rules the earth.

(Continued from last issue).

CHAPTER XIV.

THE RENT VEIL.

Jane hesitated a moment, and under the glow of the firelight on her cheek the slow colour rose.

"Well, since you ask me, Helen, I don't actually think he is looking very well."

"He certainly is thin. I noticed it as he went down the path this morning. But why is he thin? Why should he not look well? I look after his creature comforts well, and I think he eats enough."

"It is not a question of food," said Jane, calling a spade a spade with her usual frankness. :'Of course; he is worried, any body can see that."

"About me, I suppose?" said Helen a little hardly.

"About you, of course; what else would there be to worry him?"

"Two lumps of sugar, is it? I have forgotten for the moment; and don't knit your brows at me, Jane; I won't have it at any price. The house of defence should never have a frowning portal."

Jane smiled a little unsteadily as she took her cup. Helen lifted her own, and they drank their tea in a silence that could be felt.

"I am going to tell you, Helen. Claude came to see me yesterday."

"He did? That was where he was for a long afternoon, and why he did not need any tea when he came back. But why couldn't he tell me frankly where he had been?"

"Well, if you wish the truth, and indeed I think it best always to be truthful, I suppose he did not wish you to know he was talking about you."

"To you?"

"Yes."

"But I should not have minded that. He has a perfect right to talk about me to you. You see, I have a perfect confidence in you both. You are my friend, aren't you? If I thought you were not, everything would be impossible. Well, and what have I done?" asked Helen; and the tone of her voice was not very encouraging.

"It is not what you have done—that is perfect, and Claude loves you to distraction. It is rather what you leave undone. He loves something else, the work to which he has consecrated his life, and your attitude towards it is killing him."

"But I promised him nothing. I did not pose as a religious woman. I told him all along, even on the very day of our marriage, that I would fall far short. I think honestly, Jane, that I have kept my part of the bond, the part I undertook. I have made him a home." ...

"A home!" repeated Jane. "What is that? I have never had one. I have lived in several houses, but I don't think I know what it is to have a real home. But so far as I have thought about it, a home does not seem to me to be summed up in material things."

"They are the groundwork, the essentials, you may believe that," said Helen primly. "A man will say he is indifferent to externals; but he isn't, not even the best of them. Claude likes his creature comforts as well as any man I have ever met."

"But surely, Helen, there is something else?"

"Well, I am very amiable; I strive not to lose my temper, though once or twice I have felt frightfully provoked. What else is there?"

"Personal sympathy, warm personal interest, community. I am a single woman, but surely I am right in saying these must be the essential basis of a happy marriage."

"I never expected a happy marriage and I warned him. He was passing good to me in my extremity, and I was tempted. It was a mistake, but it can't be undone. Why can't he accept me with all my limitations, and leave the rest?"

Jane set down her cup and leaned her elbows on her knees. She had not expected that the veil would be so suddenly rent, but, on the whole, felt glad of it.

"Perhaps you will tell me exactly what Claude said yesterday; what is the ground of his complaint? Indeed, you must tell me; it is my right."

Jane did not dissent, but cast about in her mind for the fitting word. She had not Helen's choice of words, her clear, sharp, incisive tongue, her quick woman's wit; but she had her own strong native common sense, and her unswerving devotion to the truth—no bad weapons to match against the other. And because she loved these two creatures—her brother and his wife—above and beyond anything else, because they represented her all, she prayed that she might use her weapons aright.

"I don't express myself very well, dear," she said very quietly. "But it is your continued absence fron church, your standing absolutely outside the work of the church, which is killing him. It is doing him harm, mentally, morally and spiritually, and it is not a good thing for the parish. Don't you see it weakens his influence, for if a man has so little spiritual power over those of bis own household, what must people think?"

Jane spoke with great deliberation, realising that the time had come for plain speech, and not afraid of offending Helen. She believed that the understanding between them would bear even this heavy strain.

"Mentally, morally and spiritually, he is the worse for me," said Helen with a sharp note in her voice. "It is rather a heavy indictment, isn't it?"

"It is true," replied Jane invincibly. "Don't you see he loves you so devotedly that he can't bear that you should shut him out of your life like this, that you should absolutely refuse to share his interests. What is it that keeps you back?"

"Nothing, except what I have said. I have never been a church-goer. I think there is a lot of hyprocrisy and even wickedness done under the name of religion; why, my stepmother, who is one of the worst women in the world—I say it quite deliberately, because she is absolutely without a heart—is both devout and exemplary in her church attendances. She, who would not move a little finger to save another woman pain, would get up on the coldest winter morning to the early celebration. She would not miss it for the world. I have no use for anything that bears that kind of fruit."

"She is only one woman," said Jane stoutly. "Think of all the others you have known who bear a different record."

"I have not known any, only you. You are certainly the best woman in the world, Jane Secretan, but I believe you would have been that had you been brought up among the heathen. It is your natural goodness, which is totally independent of outward aids."

Jane shook her head.

"There you are quite wrong. My faith has made me what I am, though I fall far short of what you say about me. Listen, dear. I am naturally a bad-tempered woman, hot, jealous, and I could be vindictive. In the old days I used to be very angry against my brother, especially in his Oxford days, when it cost so much to keep him, and we were stinted at home, and he took it all as a matter of course, never seeing how our father aged, nor how the lines deepened on our mother's dear face. I was angry for myself, too, for I wanted things. I wanted to be educated, to have his chances, to go abroad even, and I was often cross and horrible to him. It was only God who showed me the hardness of my heart and helped me to overcome it."

"But I don't in the least see that you were called upon to overcome it. It was a perfectly legitimate indignation. I should have felt it myself. Indeed, I feel it now every time I look at you. Claude has been polished at your expense, Jane, and there is no fairness in it."

Jane, a little breathless, even shamed at secret confession, sat back in her chair. "He was worth it. See what a power he is in the pulpit, and how much beloved in the parish. Supposing I had had the chance instead? What should I have made of my life? I could never have used such talents as I possess in that way. No, no, Helen, it is right that men should have the best. It is they who carry on the work of the world."

But Helen only shook a rebellious head.

"The best of them are inferior to us, Jane, and in your heart of hearts you know it."

"To get back to the question of real religion and the false, let us come nearer home, Helen. What was it, do you think, that gave me power over myself so that I was glad instead of angry when you came? I had my sharp hour, my battle with the powers of evil, but God was by my side, and showed me the hardness and selfishness of my heart. And when I saw you that day come so sweet and smiling into the house, my heart was just melted within me. I don't know whether you saw it."

Helen set down her cup and ran to Jane's side, and, kneeling by her, threw her arm about her waist, and for the moment they held one another close.

"Dearest," said Jane, with the sweet mothering note in her voice. "It is the true thing, the great thing, the only thing in life, it consecrates everything. For your own sake and Claude's sake, and—and for the sake of those who may come after, don't harden your heart."

"There will never be anybody to come after," said Helen, with her face hidden. No, no, don't talk about it. It was a frightful mistake I made to marry without love, and without realisation of all marriage meant. I would go back if I could."

"There can't be any going back; but don't you think, Helen, that in time you will feel different? Claude is very lovable. I found him so, and many women have thought so. I am sure."

"It isn't that. He is far too good for me; but I'm done with that sort of thing, Jane. My heart is seared. Claude understands—I have told him. He quite promised that too much should not be expected of me, and though I don't mind you and he talking about me like that, still it hurts a little, don't you see. I don't think it is quite fair."

Jane was silent a moment. "We had not seen one another except on Sundays for quite a long time, and I was very glad to see him. Helen, I think he knew that, and blurted out things in a little rush of—of feeling. He did not come to the Court with the intention of discussing you with me. I am quite certain of that."

Helen did not for a moment reply;

MORE PINKHAM CURES

Added to the Long List due to This Famous Remedy.

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound for years and never found any medicine to compare with it. I had ulcers and falling of the uterus, and doctors did me no good. I suffered dreadfully until I began taking your medicine. It has also helped other women to whom I have recommended it."—Mrs. HENRY CLARK, Glanford Station, Ontario.

Another Cure

Harvey Bank, N. B.—I can highly recommend Lydia E. Pinkham's Vegetable Compound to any suffering woman. I have taken it for female weakness and painful menstruation and it cured me. — MRS. DEVERE BARBOUR.

Because your case is a difficult one, doctors having done you no good, do not continue to suffer without giving Lydia E. Pinkham's Vegetable Compound a trial. It surely has cured many cases of female ills, such as inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, that bearing-down feeling, indigestion, dizziness, and nervous prostration. It costs but a trifle to try it, and the result is worth millions to many suffering women.

If you want special advice write for it to Mrs. Pinkham, Lynn, Mass. It is free and always helpful.

Baby's Own Soap

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.
Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use

Gates' Life of Man Bitters and Invigorating Syrup No. 1.

and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers.

Yours very gratefully,
John W. Margeson.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this ofier. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

FALLING SICKNESS

Fits, Epilepsy, St. Vitus' Dance, Nervous Troubles, Etc., positively cured by LIEBIG'S FIT CURE. We will send trial bottle FREE if you will mention this paper. Write the LIEBIG CO., Spadina Avenue, Toronto.

When you have a bilious attack give Chamberlain's Tablets a trial. They are excellent. For sale by all dealers.

then Jane went on again, speaking with great earnestness.

"Couldn't you at least brace yourself to go to the morning service regularly?"

"I have been there two or three times, Jane; don't speak as if I had never gone at all."

"But, regularly, Helen, make it a part of your day. I think you might do that just in the same spirit as you arrange the house, or order the meals."

"Ah, but that is different; there would be hyprocrisy in that, Jane, and I am surprised to hear you. But why won't Claude and you let me alone? I—I try to do my best, and I think the village people at least don't misunderstand me. Ask Ann Coyne for my character."

Jane smiled.

"I don't need to do that; I love you, dear. Well, don't let us talk any more about it. I'm no believer in too much talk. It is worse than silence. Please God, it will come all right one day. I shall go on praying. I'm full of worries about the Court this afternoon. It's incredible how foolish a man can be."

"You mean Tom Courtney?"

"Yes. The new squire came to see him this afternoon. Have you seen Sir Anthony, Helen?"

"Oh, yes, we dined at Mardocks! The Duchess looks very nice. Her face is so interesting. She looks as if she has had a great deal of experience."

"She has. Her life story would fill a book. She would like to know you, Jane, and I'm going to bring her to call at the Court one of these days, only you must let me know when Tom Courtney is out of the way quite safely.

"Didn't he get on with Sir Anthony, then? He's a dear, a man anybody could love, so clean and honest and wholesome. He has never made any money, and the fortune which enabled him to buy Mardocks was left to him. I feel sure he will squander it unless somebody looks after him."

"He was very nice to Tom, and Tom was rude, yes, quite rude," said Jane vexedly. "But then he had been drinking. Do you think, Helen, I might take it upon myself to remove all the drink out of the house? Sometimes I think I will."

"Try it. I should if I were you. And if he cuts up rough, all you have to do is to pack off and trundle over here. I shall never put anybody in that cherry-coloured room, Jane. It's sacred to you."

Jane smiled a little tenderly as she jumped up.

"You are very good, dear, and though I don't say much, I think about that cherry-coloured room you fitted up for me. It gives me a warm, cosy feeling about my heart just to feel that it is there."

"Why are you in such a hurry? It isn't much after five. I suppose you can't stop to dinner and see Claude?"

"Not to-day; I must go and see Ann Coyne. I'm hunting for a daily governess for the children, and her niece would suit, if she still wanted to come home. Good-bye, dear Helen, I am often thanking God for giving you to me."

"And I, if I prayed, would thank Him, too," said Helen, with a sudden full note in her voice. "My house of defence."

She sat pondering on the talk they had till the fire nearly burned out on the hearth; then she bestirred herself to find out how the evening meal was progressing. Helen gave her whole attention to her household details, and was not above giving Hannah practical instruction in the art. She had taught the raw country girl, trained only in the rudiments of household science, all sorts of dainty dishes and dainty ways, with a surprising result.

Hannah did not lack intelligence, and her ambition was now awakened, never to sleep again. Helen did not know that their joint achievement in the Rectory kitchen was the subject of much boasting at the Girls' Club, which still met once a fortnight, under the supervision of Miss Jane. It was the only parish work she had retained, and that only because Helen refused, and she could not bear the idea of dropping it.

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility, your Wonderful Health Belt cured me. I am a man again. Use my name name as you see fit."

LEON TURPINANT,
Stellarton, N. S.

Perpetual youth. That is percisely what I mean. I say as man to man give my Health Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private eymptons of weaeness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physicians if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at small of the back; it cures backache in one application; you feel better immediately; inside of an hour. Two months will make a new man of you. No drugs; no privations: no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatica, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and wern by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the belt. No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for anyone needing new vigor.

Dr. D. M. Sanden Co., 140 Yonge Street, Toronto, Ont.
Dear Sirs,--Please forward me your book as advertised.

In Colored Post Cards-FREE

We want a chance to cure every stammerer and stutterer. We want their names and addresses and ages as near as you know them. Send us all you know and we will mail you, free of all charge, a series of 25 wonderful colored post cards illustrating a trip around the world. Splendid for your album or to mail to your friends. At the same time you will be doing a good turn to the sufferers whose names you send us. Send them all to-day to 10c

The Arnott Institute, Berlin, Ont. Can

About ten minutes to seven Helen heard her husband's key in the door.

She moved out to the hall to greet him, and saw at once that he looked unusually tired and pale. She, on the contrary, had a high and rich colour, and her eyes were brilliant.

"I'm afraid you've had a horribly tiring day, Claude. Is it necessary to sit out these dreadful diocesan things."

"There was no meeting, dear," he answered mechanically. "I went to see the Bishop on a private matter. He was to be in Bradfield, and said he would spare me an hour."

She stood quite still, with her hands lightly clasped in front of her, looking at him with a mute inquiry in her eyes.

He came near to her, laid his two hands on her shoulders, and turned her sweet face to the light.

"Helen, I don't think you have any idea how precious you are to me, how you fill my whole life, to the exclusion, I had almost said the shameful exclusion, of everything else."

Her colour deepened ever so slightly, and she drew herself away with a touch of genuine embarrassment. She did not permit much love-making, but sometimes she could not keep it back. And nobody knew, least of all Helen herself, that slowly but surely some responsive echo was beginning to awaken in her heart.

"What did you want to see the Bishop about? Remember, Claude, I don't want to leave Midcar. I'm happy here. I should simply hate and loathe a new place, so if that was your business with the Bishop, it is off."

His heart beat a little faster as his hungry eyes cleaved to her face. Never had he heard such an intimate note in her voice, and the admission that she was happy meant much to him. There were moments when he had feared the reverse.

"We'll talk about it after dinner. I'm hungry, Helen, and you have spoiled me with your Parisian feasts. I can't go out into the country inn as I used and revel in the eighteen-penny ordinary."

She laughed spontaneously.

"I'm glad I'm educating you. Dinner will be on the table as soon as you are ready for it. Jane was here this afternoon."

"Jane? Ah, yes, Jane," said Secretan, and a little uneasiness crept into his expression. But, looking at Helen's serene face, he decided that Jane had been quite loyal. She had not even hinted to Helen the subject matter of their yesterday's talk. Yet as he ascended the stairs to his dressing-room to remove the dust of his journey, a scarcely perceptible sigh escaped his lips.

(Continued in next issue).

Mother's Christmas.

Mother was dreaming in the dark by the great hall fire-place. She loved to dream there for the hall was generally dark, and at home they used to have a fire-place. Suddenly, she was disturbed by voices in the sitting-room. It was Madeline, her adopted daughter, who was speaking in her shrill, agitated tones, and before mother could actually realize that she was the subject for discussion, she heard Madeline saying:—

But Charles we simply can't take mother to tea at the Beresford's. They are the most elegant people in town and mother is getting so old-fashioned and childish. She does the most outlandish things and nearly drives me frantic on the streets by picking up old blue platters and other hideous, useless articles in the cheap shops, and the other day at that frigid Miss Chillenger's, she told about how poor Ralph and I were, when she and Uncle Cyrus took us, and, how they worked night and day on the old farm to educate me. Ralph died, you know, a little while after we went there. Of course I am grateful, but I don't think it's necessary to have our affairs aired in public, and it's quite impossible for her to go to the Beresford's; but Mr. Beresford's mother especially invited her, so what are we to do"

"But we must go to the Beresford's," her husband replied "you may arrange the matter any way you please, but we go, for Beresford has the clearest head for business I have seen for many a day, and he and I have much in common, so if his new plan succeeds, we will be so many rungs further up the ladder of prosperity."

He began crashing the keys of the piano to put an end to the conversation, and in the meantime poor little mother had fled to her room having heard just enough to wound her cruelly. With her head in the pillow, she wept until she could not weep any more; then arose hastily, arranged her room and began packing a small satchel. "I never dreamed I was a bother," she moaned pitifully, "Oh, it seems as if my heart could break, for I loved them so. But never mind mother will never trouble you any more," and putting the last touch to her preparations, by writing a note, she lay down to broken slumbers.

Before anyone in the house was stirring next morning, she slipped away to the depot, leaving the note which caused such consternation on the dining-room table. A heavy snow was falling when she entered the car, and before they were fairly into the country, it had increased so that it was impossible to see out. She devoted her time to wondering whether her maiden sister would be willing to board her or not and how

Don't Let The Soil Starve

YEAR after year, your crops take nitrogen, phosphoric acid, and potash out of the soil. These elements are absolutely necessary to the growth of plant life. What are you doing to replace them?
You can keep your soil from starving by spreading fresh manure, evenly, in proper quantities. Manure, spread in this way, puts back into the soil the very elements the crops have taken out. To spread manure evenly, you must use a manure spreader. When buying a spreader get a good one.

IHC Manure Spreaders

have proved their quality. Owners like I H C Spreaders because of their simplicity, strength, durability, and light draft. The superiority of these machines is due to the following constructive features:
The method of transmitting power from the wheels to the beater is simple and direct. There are no unnecessary parts to wear. The beater is large in diameter and the teeth are long, square, and chisel-pointed. By using this style of tooth, the manure is thoroughly pulverized and is thrown out before it wedges against the bars. This reduces the draft.
The apron is supported by steel rollers and the slats are placed close together, so that manure does not sift between. The steel wheels have ample strength to carry many times the weight they will ever be called upon to bear. Rims flanged inwardly, prevent cutting of meadows and accumulation of trash.

CORN KING and CLOVERLEAF

are machines that will merit your heartiest approval. They are made in many sizes, for field, orchard, and vineyard. Get complete catalogues and all information from the I H C local dealer, or, if you prefer, write nearest branch house.

the old home would look. "I suppose Becky will think me 'a queer little piece' like she used to," sighed poor mother "and I guess now I must be, but it gives one comfort to think there is one home waiting for them at the end of life, even, if they are 'queer little pieces."

The storm outside was raging in fury now and the great iron monster struggled and groaned as it tore through the forests, panted for breath as it mounted the hillsides and finally when mother was growing drowsy, it gave a tremendous jerk and ceased the battle.

There was a cry of "snowed up in the valley!" a rush of feet, a murmur of troubled voices and then a big conductor with a lantern 'bent over mother and asked her if she would be able to stand the cold if he were to carry her to a farm-house where she would be made comfortable.

Mother consented in trembling tones and wrapping her in a great coat, he battled with the surging sea of snow underfoot and the blinding force of it overhead until he set her down in a farmhouse kitchen where a cheerful, little farmer's wife brought her hot drinks and she was rubbed, heated and cheered until some warmth was instilled into her feeble body, but the cheeriest ray which warmed her heart was a little cherub of four years old, who crept into her arms and whispered, "I love you, cause your like my grammuzzer."

She clasped the soft head against her cheek and great homesick tears came as she remembered how she used to hold little Madeline in days gone by. Then the other children kissed and petted her, and the cheerful farmer's wife, Mrs. Drew by name tried to comfort her by saying the roads would probably be cleared out by the day before Christmas so she could get home.

This only caused the salt tears to flow faster and impulsive as ever, she told the kind-hearted lady all about it, but true to her children, she pretended she had found out she was in the way, herself.

Mrs. Drew understood and a letter was written to tell of her whereabouts so when Christmas came they could not do without her until it was over.

How mother enjoyed those Christmas preparations; she made candy, baked old-fashioned cookies, told them stories and even went with Mr. Drew to the store where she selected presents which made five little Drews happier than ever and that is saying much, you may be sure.

Then on Christmas Eve when the final task was done, they held a jubilee in the kitchen. Brown heads, yellow heads and black heads bobbed hither and thither. Mr. Drew waltzed Mrs. Drew about until his foot caught in an apple-basket, he, being unaccustomed to this form of exercise, and he came down with a crash sending apples hither and yon. At this critical moment two snow-clad figures appeared in the door-way. The children tried to hide behind their mother, Mr. Drew rose with alacrity, but mother alone knew who they were.

Just for a moment a pang of regret swept over her, then she was gathered into the penitent arms of Madeline; somehow everybody got to talking at once, Mrs. Drew was wiping her eyes and Mr. Drew blew his nose so violently it brought them to a startled standstill, and through her tears mother bade them forget it all and join in the fun.

That Christmas was a memorable one in the Drew household. Madeline and Charlie both refused to go back Christmas morning; and in the forenoon the former, enveloped in a big blue apron, basted the goose for dinner and it gave her husband such an appetite that he threatened to banish the cook when they got back home.

But when dusk was gathering, they wrapped up mother and carried her back to their city home. Happy little mother! She never felt again that she was in the way and when the angels carried a sweet-faced baby to the Wordsworth home, her happiness was complete.—Hilda Lorne.

Make the Home Comfortable.

The material things to make home comfortable are several in number, and vary somewhat according to the home; but some things every home should have, to be truly comfortable in winter. Perhaps the greatest necessity to comfort when coming in shivering from the cold is a good fire. What a comfort is a cheering heat, whether it comes from the blazing logs in an old-fashioned fire-place or the radiator or register in a modern home. Let the house be kept warm, not overheated. An average temperature of 70 degrees is sufficient then there is not the likelihood of taking cold when one steps out. When you see a home where the thermometer soars between 80 degrees and 90 degrees all winter, you will also see a home where colds are prevalent.

Perhaps next to a plentiful supply of fuel a bountiful table is necessary. During cold weather we need a greater amount of heat producing foods. We can readily consume beans, pork, mince pies, etc., in winter which would put us on the sick list if indulged in during the summer. The larder, the cellar; the meathouse and the granary should be well stocked for winter comfort.

Good warm clothing, especially underwear for the whole family, from the father to the wee tot, is a necessity to comfort and health. "To prevent colds and sickness in children," a doctor said, "dress them warm and let them run." If the proper clothing is worn, a regular temperature observed in the house, good fresh air admitted without stint, and some out-door exercise taken every day no matter how low the temperature, colds would soon be a thing of the past for old and young.

The house, especially the bedrooms, should be thoroughly aired every day. At night put on plenty of bed clothing and leave a window open, at least a foot, all winter long. If some are too sensitive to a draft, a muslin screen over the opening will be beneficial.

While caring for the physical man, the mental should not be overlooked. What a comfort on cold winter nights with the wind whistling fiercely around the house and the snow piling high, to sit snug and warm with the loved ones at home, reading from favorite books or periodicals. Good reading should always be at hand. Now with books so cheap and such excellent periodicals to be had at such reasonable prices, no home should be without a plentiful supply of literature. What picture could be more alluring to a traveller than a scene around a cheerful fireside, with all the folks, father, mother, brothers and sisters, and perhaps a friend or two, under the evening lamp, reading and studying; and as a diversion eating light, fluffy popcorn or rich, full nuts brought out by the thoughtful mother?

In the comforts of home we may become too self-centered. A home cannot be truly happy unless it sheds its beams on other homes. The home that brings the most sunshine to others will have the most sunshine within itself, be it a one-roomed log cabin or a palatial residence. If a home seeks but its own comfort and happiness, being selfishly forgetful of others, happiness will flee it as persistently and elusively as the pot of money at the end of the rainbow. But the bread of kindness cast upon the waters in thoughtfulness for others will surely return to you some day, perhaps most unexpectedly.

But after all it is not the external things that make a house a home. It is an intangible something hard to define that makes a cabin or a palace a very Paradise on earth, or the lack of it that leaves it but four walls—merely a place to stay. What is it that brings that atmosphere of home? Love is surely the foundation. But there must be the proper expression of love in patience, kindness, unselfishness and thoughtfulness for each other. We have all seen families where there was absolutely no doubt of their love for each other, but they had such a queer way of showing it. If some great trial should come upon them, they would stand by each other to the death, but in the little, petty annoyances of life they were cross and crabbed. In such a home there is not the truest happiness. To bring the genuine peace of home life we must all bear and forebear with each others' weaknesses, because no two of us see or act or think alike. The old Quaker expressed an universal truth by saying to his wife, "All the world's queer but thee and me, and sometimes I think thee's a little queer." If every member of the family would recognize that difference and apply the Golden Rule to the others' "queer" ways, and make up his or her mind to open a fresh can of smiles every morning and be as pleasant and agreeable to the home folks as one is expected to be in company, we would hear far less of family jars, quarrels and divorces. If anything has gone wrong at the office or the store or the school room we take out our spite on the folks at home by being surly and disagreeable, forgetting that one cross person in the family circle will put a damper on the good spirits of all the rest. Have we any right to thus vent our spleen in the home? Surely we owe it to our dearest ones at home to be there at our very best at all times and under all circumstances, thus adding the first and greatest comfort to a home—happiness.—J. E. H. in Indiana Farmer.

here and scarcity of water, cows have not made as good a showing as for corresponding months last year, but as the number of patrons are steadily increasing, the output of the creamery will be the largest in its history. Crops were fair in this locality, hay about an average crop. The continued drought was hard on grain and roots, and they were considered rather light. Fruit did well but a considerable quantity dropping off the trees, owing to dry hot weather, did not go as large a crop. Stock of all kinds was scarce and brought good prices. Prices in local markets were also good, and although there was not so large a crop as last year, yet we are optimistic, and by trying to improve our methods in farming and also in breeding our stock, our society will, we hope, make greater advancement in the future.—W. S. McKean.

Annual Meeting of the Maritime Bee-Keeper's Association.

The Annual Meeting of the Maritime Bee-Keepers' Association was held in the Board Room of the Winter Fair Building, Amherst, on the evening of the 6th. inst. The following officers were elected for the ensuing year:

President—E. L. Colpitts, Petitcodiac, N. B.; Vice-President—C. W. McLellan, Falmouth, N. S.; Sec'y.-Treas.—B. W. Baker, Amherst, N. S.; Directors—R. L. Todd, Milltown, N. B.; W. B. Wallace, Newport Landing, N. S.; W. N. Tanton, Charlottetown, P. E. I.

The reports of the officers of the past year showed an increasing interest in bee-keeping and the Association in good financial condition. Messrs. B. W. Baker, Amherst, N. S.; I. C. Craig, Amherst, N. W. Bf Wallace, Newport Landing, N. B. were appointed a committee to revise the Apiary Departments of the prize lists of the Maritime Exhibitions.

The Association will continue the work of distributing literature and answering inquiries concerning bee-keeping, and any person requiring information along those lines will always find the officers ready to give any assistance.

E. L. Colpitts.

FLORICULTURE.

H. E. S., St. John, writes:—

Please tell me what to do with a Lace Cactus that has been in the earth since the latter end of August. I thought it had rooted but it does not seem to have any roots although the top is nice and green. I have two Hoya slips that have been in the earth about the same length of time as the Cactus and the rootlets are very tiny but the leaves are about the same as when planted. They may have grown a very little. What had I better do with them? I have scraped the dead parts of the Cactus roots. I have lost several Chinese Primroses—they rot off just above the earth. I put matches in the earth, what else can I do?

Ans.—The Cactus will undoubtedly root in time, if the soil be well drained and only fairly moist. Drainage is most essential, when soil is used. like Nasturtium can be obtained? You did rightly in removing the decayed roots.

The Hoya or Wax Plant also roots slowly, especially during winter. The period of growth usually commences during the month of March, when if alive your cutting will probably "take hold." Keep it moist and see that drainage is good.

I fancy that you have rotted the Primrose by watering over the crown of the plant. Water should never touch the centre of a Primrose but should be applied around the edge of the pot. I am afraid that if your plants have started to rot off they cannot be saved. I do not think matches will help much. I would not use them.

St. John, North End, wants to know if we can tell where a plant that looks something like a Balsam, with leaves that are rose like with bright pink flowers that have tails Also how it is grown, whether from seed or cuttings. She has heard it called Siberian Rose.

Ans.—The plant referred to is evidently the Sultana, the seed of which can be obtained from all seedsmen. Sown in February it will bloom the balance of the year if carefully treated. These plants are very easilt grown and are quite showy. It is a wonder that they are not more appreciated.

Mrs. B. A. B., St. John, writes:—

Please tell me what the best variety of ferns would be for a parlor. There would be no sunlight but the rooms are warm and large windows admit plenty of light? I have tried the Scotch fern with indifferent results. Will the Boston fern thrive under such conditions? I am told they require sunshine in order to suceeed.

Ans.—You should have good results with the Boston ferns under conditions named. Sunlight is not absolutely necessary for this class of ferns. In fact, I have seen some fine specimens, in this city, that have never seen the sun.

If you desire a large fern get the old Boston or any of the so-called Ostrich Plume type. On the other hand if a short, compact, bushy plant is desired the Boston Scott fern is best, but remember that where there is heat, plenty of moisture about the foliage is absolutely necessary in the form of spraying, sprinkling and washing at least once a week. Good drainage is also imperative.

Primrose, Hampton, writes:—

I have a small Primrose plant, the lilac shade. It grows well but I find the underside of the leaves covered with little white flies that are very agile. These pests are also on some little Geraniums in the same window. Will they hurt the plants, and if so, how can I destroy them? One of my neighbors complains of these same flies and thinks that they are injuring a Calla Lily.

Ans.—The white fly is a most persistent pest and one not easily killed. Their damage is, however, not so great as their numbers would imply. Dust the plants thickly with pyrethrim insect powder and kill all that fly about wherever you find them.

They are, usually, more troublesome in the spring when if you put the plants out of doors they will leave the plants for some weed that suits their fancy better. In this manner you can easily get rid of them. We seldom have a complaint of these pests in the fall.

The Sword fern is very apt to lose its foliage if it is not watered freely, and the foliage sprinkled. This is the cause of the dry or light green color of the leaf. Before fires were started watering twice a week would likely be sufficient, but after the air is dried with artificial heat the plant must have more moisture.

Some Factors in Potato Improvement.

The subject of breeding potatoes for seed, improving a variety of potatoes or breeding a new variety, was interestingly discussed by Prof. Raymond Pearl, Maine Experiment Station, under the subject of "Some Factors in Potato Improvement," at the closing session of the convention. Prof. Pearl said:

"The method of improving potatoes most often used is that of tuber selection. The man selects the tuber whica appears to him to be most like what he wants, and then plants where he can know and watch his hills. The tuber, however, is not really seed but a part of the plant, and what he is really doing is planting a part of the plant. Frequently in doing this, one does not get potatoes anything like the one which he planted. It very often happens that if one plants single eyes, the potato from one eye may be entirely different from those produced from the other eyes. This is bud variation, for the eyes represent buds. Bud variation has been very little studied and really little is known on the subject.

"The yield of potatoes has been slightly increased by continued selection. These Luther Burbank stories about marvelous increase by breeding are largely fairy tales. The man who has been doing this work considers that he is doing well if he makes a small improvement.

"I think we can safely say that such selections as picking out two or three hundred tubers and planting a few of the very best will insure some improvement. There are three things to remember and work up to —type, yield, and disease resisting. While I do not want to say that we can breed in this way a disease resisting strain, I do not think it can do any harm to select from a field which has been struck hard by blight the few plants which have not been struck. It is well for a person to keep his eyes open and take a chance, for it is often the unexpected which brings results. The greatest discoveries have often been made by accident.

"Regarding really new varieties, these are raised by propogating from seedlings. This is the only way that really new varieties can be originated. In some cases new varieties have been originated by careful control of pollenization but most of them have originated by chance. Any one who is interested can have a good deal of pleasure and possibly strike something that will be very valuable by planting potato bolls and cultivating the seedling.

"I am not advocating this as a practical proposition in breeding potatoes, for it is perhaps the most impractical thing you can do. But you will certainly learn a good deal about potatoes which you would discover in no other way.

"In regard to the running out of seed, no one has carried on experiments in pedigree selection to know whether the improved seed will offset the tendency to degeneration. There is no explanation and no evidence to show why potato seed runs out. In Colorado it is said that seed which is running out shows an increased tendency to blossom, and they select seed from plants which never blossom. Therefore, the following suggestions for potato improvement are well to keep in mind:

"The best seed potato, the fewest blossoms.

"Eyes shallow and simple, instead of compound.

"In getting new seed, bring it from less fertile to more fertile land.

"In exchanging seed it is desirable to make exchnage between localities not very far apart.

"It is desirable to take seed from fields which uniformly produce seed of uniform size and type."

THE MEN WHO ADVERTISE in the Maritime Farmer are experts in their business. It will pay you to consult them about your needs in their line. Tell them you are writing them because you saw their advertisement in the Maritime Farmer where all ads are guaranteed.

Hog Killing Simplified.

As the scalding is the most important part in dressing off a hog, let us consider the water first. As a rule, the ordinary farmer has the old-fashioned scalding tub, an appliance good enough for anyone. If he has not a set kettle he must depend upon the kitchen stove for heating and for two or three hogs it will take all the water that can be heated in this way or in a set kettle. Keep one thing in mind, the water must be boiling, in order to make the rule a success that I am about to give.

As soon as the water all boils, stick the hogs, all of them if there are only two or three. Then immediately pour the scalding water into the tub, counting accurately the number of pails. For every eight pails scalding water add one of cold and stir well, and put in the heaviest or oldest hog head first. Keep the animal turning and try the bristles very often and strip the feet and legs, also the belly, at the very earliest time. As soon as the bristles start very good haul out the hog and let the other end into the water.

It is needless to say work lively. With a good scraper clean the head and forward part while the hog is still in the tub. Haul him out at the earliest possible time and put in the next hog. In the meantime have a little kettle of extra boiling water to add as the scalding progresses, because the water will cool some, especially if the weather is very cold and windy.

Have all knives as keen as a razor so that all cutting can be clean instead of ragged. I have always liked the idea of washing off and shaving with a sharp knife after the hog is hung up; still this is immaterial and can be done according to the fancy of those doing the work. Wash off very clean with cold water. Split the hog the whole length of the belly sawing the bone at the hind part and the breast bone. Remove the intestines and stomach at one operation; then the liver, heart and lungs, and finally the tongue. Some leave these in for inspection. Wash out immediately with plenty of cold water, and split the back from end to end with saw or cleaver. Many a good carcass is lost from poor and insufficient cooling. Trim out the bloody neck neatly with a sharp knife and the hog is ready to cool off. Tackle blocks will assist much in the work of lifting the animal.

KILLING 15 OR 20 AT ONCE.

Guesswork does not enter the operation of dressing of hogs, and this refers more especially to the proper temperature of the water. The man does not live who can determine the proper temperature by dipping the finger tips in the hot water. The rule as given never has been known to fail, and where a thermometer is impossible is a most convenient rule to follow. If everything works well from 6 to 10 minutes is sufficient to dress off a hog under farm circumstances. Where there are 15 or 20 hogs to dress off the scalding arrangement should be a little more extensive and a common molasses hogshead used in place of the common scalding tub. Two set kettles of water will be necessary to start operations in good shape Then the animal can be completely submerged and should be kept turning continuously and tested very often to know when the bristles and scurf start easily.

It is customary with many to add various substances to the water for the removal of the hair. Long experience has proved that these are all unnecessary in successful hog dressing. The farmer who has a little something in the way of a steam plant can simplify matters very much by running a steam pipe into the scalding tank and when the temperatures reaches 160 degrees shut off the steam and begin to stick the hogs. For hogs eight months old and less a temperature of 148 degrees is the most satisfactory, and for hogs' older than this from 148 to 150 degrees, but never more than this. There is danger of setting the bristles from too great heat. A hot water thermometer must be secured in a metal tube inside the tank and raised occasionally by a string to note the temperature. Keep the steam dry and hot till the last hog is scalded. The best dressing bench is made of 1½-inch ash plank laid loosely across some sawhorses. Never use chestnut under any circumstances, because of the very objectionable stain.

STICKING IS VERY SIMPLE.

Sticking the hog is the simpliest operation of all. It is needless to say that any method that successfully opens a free incision in the jugular vein is a perfect method. For myself I like the plan best of turning the hog on his back, insert the knife 2 inches front of the breast bone and point as accurately as possible for tne tail. I have given this plan to dozens of young men and never have seen a failure yet. So I think it must be easy to comprehend.

The cutting up for the farmer's purposes is very simple and can be made a very neat, tidy job. There are no two packing houses that have the same style for cutting, each having its own peculiar method. For curing pickle that will float a good sized egg is as nearly right as possible. For curing the bacon an excellent mixture is six pounds good clean salt, coarse fine is good, two pounds granulated sugar and four ounces saltpeter, mix and use for 100 pounds meat. Pack the strips in a sugar barrel putting the mixture between each layer. Stand in a cool place. The meat will be ready to smoke in six weeks.

The Value of Agricultural Education.

(Continued from page 185).

who never saw an agricultural college, to say nothing of ever attending one. It is quite true that there are such. At one time the farmers but "tickled the ground with a hoe and the land laughed with a harpest." At present average conditions are vastly different.

The farmers of yesterday did not have so many things to battle with, as the farmers of to-day. Take the insect pests, it is only of late years that the fight against them had to be started. How to fight these pests, is one of the many things learned at Truro. How many hundreds of bushels of grain would have been saved last year through Maritime Canada if all the farmers had known how to treat for smut? How much better the orchards would be, if all who own fruit trees knew how to give them better care? So we go up the line; anything that we want to know along farming lines may be learned at Truro.

By talking with intelligent farmers who congregate at Truro, from the different parts of the Maritime Provinces, we learn how they carry on their work and their way of farming. There is another advantage of attending the short courses, we see out beyond oue own limited atmosphere as it were, and we find out that we are not the only ones who meet with troubles in farm work. In a few weeks hence, when the short courses open for 1912 let there be a grand turn-out from New Brunswick, farmers and farmers' sons, a far larger number than has ever gone to attend the short courses before. Let there be an awakening, the result of which will go on for years to come. The Governments are doing much for the farmers; it is up to us farmers to do our part, the government cannot do it all. The New Brunswick government will, this year pay the railway fare for the students attending the short courses.

I am not a prophet nor the son of a prophet, but I believe that great things are going to be accomplished along agriculturgl lines in Maritime Canada, as the years go by. The N. S. A. C. has already become an important factor in exercising much influence on the progress of agriculture in these Maritime Provinces. It is bound to continue the good work.

Can we see in its true light, what it will mean to these Provinces, when hundreds of its young men are taught and aroused to carry on farm work in a more progressive manner? If there is anything that will arouse a young man, the short courses will do it. As we look ahead into the future, I think we are safe in saying, we can see that most of the Truro farmer students will have made good. We will see more interest taken in stock-raising, in dairying, in fruit raising, in every branch of farm work that is carried on, and in setting out trees and shrubs to make beautiful the farm home. "What will it mean to New Brunswick when many hundreds of its farms are thus improved? Kingsley has said." Nothing is so infectious as example." One farm's improvement will spread to another, so that New Brunswick will be such a glowing province, that the grandeurs of the far West will fade away like the morning star at the approach of day.

Attend the short courses is the advice of one who has been there on three occasions and I venture to say you will never regret that you went.—Irvine H. Dunfield, Portage Vale, Kings Co., N. B.

H. M. C. S. NIOBE.

Smoking Bacon Without Fire.

The fol,owing recipe for the preparation of a liquid to be used instead of smoke in the curing of bacon and ham is given in an American journal: —"Mix 2oz. rectified spirits of tar [illegible] 40z. of ordinary alcohol, and add to 20oz. of crude pyroligenous acid (crude acetic acid). Shake well, and filter through a filter wetted with the acid (not water). Let the meat dry well after salting, then apply the liquid (called 'liquid smoke') with a brush to one side of the meat. Let it dry a few hours, and then apply to the other side. After drying for a few hours hang up for several days. Then repeat the process, and in another week the meat is ready to be eaten. One quart of liquid smoke is enough for 250 to 300 pounds of meat."

Mix the manure from the horse stable with that from the cattle as it is deposited in the yard. It will prevent heating.

Never use anything but pure bred sires of any kind, even down to roosters.

METALLIC CEILINGS

are everything that plaster, wood and wall paper are not.

Metallic Ceilings are fireproof, absolutely.

Metallic Ceilings don't crack or crumble—don't get damp or mouldy—don't need repairs.

Metallic Ceilings are far-and-away the most economical building material you can put in a house.

You don't believe it? We can prove it. Write us for the facts.

Boys under 15 years old—1st, Harold Black; 2nd, Geo. McWilliams; 3rd, Norman Towers; 4th, Kenneth Baker.

MAXWELL'S HIGH SPEED CHAMPION

Is The Most Satisfactory Washer Ever Placed On The Canadian Market

Last year, Maxwell's "Champion" was the recognized leader of all high speed washing machines. This year, we have put the final touch to it, and offer you the ideal machine, that includes every important improvement known to modern washers.

Maxwell's "Champion" has the largest opening of any washing machine. As you can see, the Wringer attachment is at the side, and practically the whole top of the washer opens up. This makes it easy to put in and take out clothes.

No other washer has this feature. No other washer can be worked with crank handle as well as top lever

In design, finish and appearance—in ease and quickness—in service and durability—Maxwell's "Champion" is the peer of them all. If your dealer does not handle it, write us for illustrated catalogue.

Have better butter. Use Maxwell's "Favourite" Churn. Recommended by best butter makers the world over. More of them used in Canada than any other. All sizes from ½ to 30 gallons.

DAVID MAXWELL & SONS, ST MARY'S, ONT.

We wish to call your attention to the fact that most infectious diseases such as whooping cough, diphtheria and scarlet fever are contracted when the child has a cold. Chamberlain's Cough Remedy will quickly cure a cold and greatly lessen the danger of contracting these diseases. This remedy is famous for its cures of colds. It contains no opium or other narcotic and may be given to a child with implicit confidence. Sold by all dealers.

An Advertisement in the Maritime Farmer will sell your surplus stock.

A WEAK ACHING BACK

Caused Her Much Misery.

Mrs. W. R. Hodge, Fielding, Sask., writes:—"A few lines highly recommending Doan's Kidney Pills. For this last year I have been troubled very much with nasty sick headaches, and a weak aching back, which caused me much misery, for I could not work, and had no ambition for anything. My kidneys were very badly out of order, and kept me from sleeping at nights. I tried many kinds of pills and medicines, but it seemed almost in vain. I began to give up in despair of ever being well and strong again, when a kind neighbor advised me to try Doan's Kidney Pills, which I did, and am thankful for the relief I obtained from them, for now I am never troubled with a sore back or sick headaches.

"I will always say Doan's Kidney Pills for mine and can highly recommend them to any sufferer."

Price, 50 cents per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

A Windsor Lady's Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

J. D. FRIER, Sussex, N. B., Eastern Representative.

FARMING

has become a specialized business

It's no longer a "hit-or-miss" occupation, where "any old way" is good enough. Farmers are buying pianos and automobiles as never before. They're ***living*** as well as ***working***.

The farmer has learned that it ***pays*** to employ progressive methods. That's why he is ever ready to receive helpful suggestions for improving his crops, his land and his home. It's also the reason that more than fifty thousand Canadian farmers are enthusiastic about our handsome book:

"What the Farmer Can Do With Concrete."

It isn't a catalogue, nor an argument for you to buy something. It is clearly written, interesting, profusely illustrated. It describes the various uses to which concrete can be put on the farm. Not theories, but facts, based on the ***actual experience*** of farmers all over the continent. It is the most complete book on the subject ever published, fulfilling the purpose behind it, which is to help the farmer take advantage of concrete's possibilities. The list of subjects covers every conceivable use for concrete on the farm. The book's actual value to you will far exceed the list price of fifty cents, but if you will send us your name and address at once, we'll be glad to

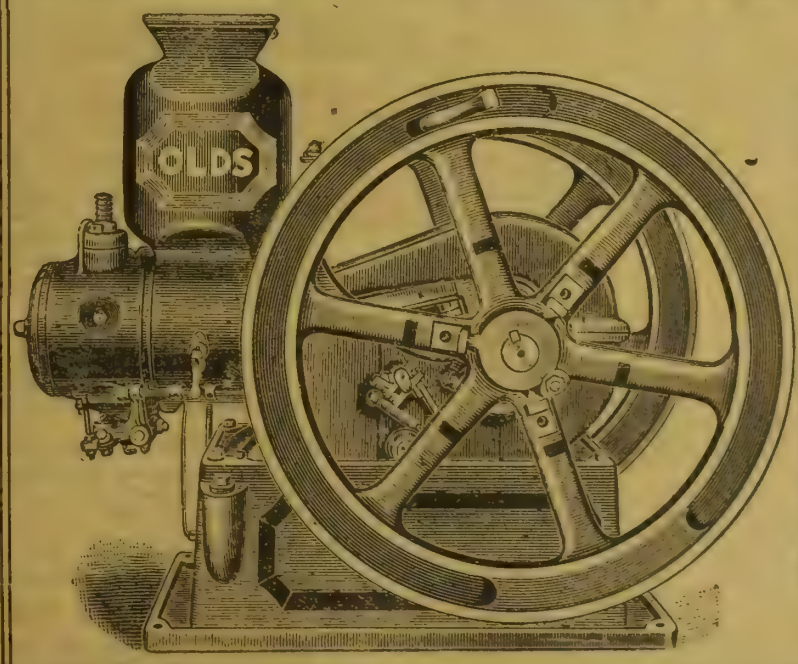
Send It To You Absolutely Free.

Send a post card for it—do it to-day. The book will be sent by return mail.

CANADA CEMENT COMPANY, Limited

National Bank Building, MONTREAL.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

CLASS 136.

Donated by the Kingsdale Poultry Co., Sussex, N. B., for best White Wyandotte cock, hen, cockerel and pullet one set Feed Hoppers—A. C. Reid.

CLASS 137.

Donated by the Maritime Poultry & Pet Stock Association, Silver Cup for the best exhibit of American Breeds of poultry—Hartland Poultry Yards.

CLASS 138.

Silver Cup donated by Percie Johnson, St. John's, N'f'l'd., for the best exhibit of poultry, excluding American breeds and Bantams—Hartland Poultry Yards.

Silver Cup donated by the late W. T. Pipes for best cock, hen, cockerel and pullet—A. C. Reid.

PIGEONS.

Sec. 1—Collection to consist of not less than four pairs of different varieties—1st and 4th, Hartland Poultry Yards; 2nd, R. Carter; 3rd, 5th and 6th, Maritime Poultry Yards.

You will find that druggists everywhere speak well of Chamberlain's Cough Remedy. They know from long experience in the sale of it that in cases of coughs and colds it can always be depended upon, and that it is pleasant and safe to take. For sale by all dealers.

HORSES—Drafters, $125 to $200; Roadsters, $125 to $200; Carriage, $125 to $200.

DAIRY PRODUCTS—Creamery Butter, solids, 28c., Pts., 28 1-2c. to 29c.; Dairy Butter, 21c. to 25c.; Cheese, 15c. to 15 1-2c.

POULTRY AND POULTRY PRODUCTS—Eggs, storage, 27c., Fresh, 30c. to 35c.; Fowl, 8c. to 10c.; Chickens, 10c. to 12c.; Ducks, 13c. to 15c.; Geese, 12c. to 13c.; Turkeys, 20c. to 22c.

FRUIT—Apples, Island grown, $1.50 to $3.00.

MISCELLANEOUS—Hay, $11.50 to $12; Straw, $5.50 to $6.50; Beef Hides, 11c.; Sheep Skins, 70c. to 80c.; Lamb Skins, 70c;. to 80c.

VEGETABLES—Carrots, 40c. to 50c.; Potatoes, 40c.; Turnips, 16c.; Beets, 40c. to 50c.; Parsnips, $1.00 to $1.25 per 100 lbs.

Weather conditions have been very favorable for Xmas trade in all lines for the past two or three weeks. The first break was to-day and the bulk of the Xmas buying was already completed. There has been a good attendance at market each market day this fall and the bulk of the produce ready for market has been moved. Prices have held steady. Oats are higher and potatoes have not been offered very freely as danger of frost has made most buyers careless about them, but there have been a lot shipped and it looks as if Spring prices for what is left will rule high. Pork is slightly easier and only choice hogs of bacon weights command highest prices. Eggs are about all cleaned up and there is no fresh gathered receipt for shipment, what few came in are not more than suffirient to supply the home demand—storage eggs are also about all cleaned up and early—the New Year will likely use up what are left. There is no cheese left except some small lots in the hands of the wholesale grocers. Butter is fairly plentiful and sufficient offering to fill present requirements, although reserve stocks are small. Beef is plentiful and prices easy, quality is only fair. Several carloads of mutton and lamb were shipped this past week to the Canadian West and there is quite a lot held here in storage yet to go forward later. Oats are scarce in this section and the bulk of what has been shipped has come in by rail from the western part of the province. Hay is not plentiful but as shipping is over for this line the requirements now are for local consumption and supply should be quite sufficient to fill the demand.

St. John Prices.

DAIRY PRODUCTS—Creamery Butter, 27c. to 29c.; Dairy Butter, 25c. to 27c.; Cheese, 13c.

POULTRY AND POULTRY PRODUCTS—Eggs, 32c. to 45c.; Fowl, 70c. to $1.40; Chickens, 70c. to $1.10; Ducks, $1.50 to $1.85; Geese, $1.40 to $1.70; Turkeys, 22c. to 25c.

MISCELLANEOUS—Hay, $10 to $12 ton; Wool, 22c.; Beef Hides, 11c.; Calf Skins, 16c.; Sheep Skins, 70c. to 80c.; Lamb Skins, 70c. to 80c.

VEGETABLES—Carrots, $1.25 bbl.; Potatoes, $1.75 to $2.00; Turnips, 90c. to $1.00; Beets, $1.70 to $1.80.

DRESSED MEATS—Beef, (carcass), 10c. to 11c.; Beef, (retail), 10c. to 20c.; Mutton, 6c. to 10c.; Veal, 9c. to 11c.; Pork, 7½c. to 8½c.

THE BOOK DESCRIBES EVERY STEP IN DETAIL

IN the organization and construction of rural telephone lines, this book, "How to Build Rural Telephone Lines," is a practical guide. It is a carefully classified volume, covering everything you need to know, from the inception of the idea to the moment the telephone is hanging on your own wall, ready for you to use. No question on the building of rural telephone lines can possibly arise without your being able to find the answer to it in this volume. It offers explanation on every point—the solution for every problem. If you are even the least bit interested in the subject, all you have to do is to clip, sign and mail the coupon and

We Will Send You FREE This Book on "How to Build Rural Telephone Lines"

Bear in mind that **you have to ask** for this volume to get it. This book represents 100 profusely illustrated pages of vital facts, bound in stiff, cloth-covered binding. Apart entirely from the cost of printing and binding, this book represents the brain work of experienced telephone men—has cost us so much money that we really ought to make a charge for it. So long as the edition lasts, however, we are willing to send it FREE to every farmer who, by using the coupon, signifies that he is interested in the subject. This book is very frank, it tells you exactly what you can do, what you must do and what you cannot do; you will be interested in the straightforward way in which it comes out with vital information. Systems of rural telephone lines are spreading a network throughout the Dominion in the form of community-owned companies. Sooner or later someone will organize such a system in your locality. Why shouldn't **you** be the man to do it? In any event you owe it to yourself to know all there is to know about this subject. Better send the coupon NOW, while you are thinking about it.

The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

DE LAVAL
CREAM SEPARATOR

Now is the Time to Buy and Start the New Year Right.

There is no good reason to defer the purchase of a DE LAVAL cream separator until Spring. On the contrary you may buy one now and save half its cost meanwhile. Moreover, if you can't conveniently pay cash you can buy a DE LAVAL machine on such liberal terms that it will actually pay for itself.

As to YOUR need of a centrifugal separator, if you have the milk of even a single cow to cream you are wasting quantity and quality of product every day you go without one. This waste is usually greatest with cold weather and cows old in lactation, and it counts most, of course, when butter prices are high. Then there is always the sweet skim milk and saving of time and labor in addition.

When it comes to a choice of separators DE LAVAL superiority is now universally recognized. Those who "know" buy the DE LAVAL to begin with. Those who don't replace their other separator with a DE LAVAL later — thousands of users do that every year. If YOU already have some other machine the sooner YOU exchange it for a DE LAVAL the better.

Why not start 1912 right in dairying? TRY a DE LAVAL machine for your own satisfaction if nothing else. See the nearest DE LAVAL agent or write us direct and we'll do the rest.

173 Williams Street, MONTREAL, CAN. **THE DE LAVAL SEPARATOR CO.** 14 Princess Street, WINNIPEG, CAN.

A Convincing Argument.

A Pair of Cattle Gained 550 Pounds in 34 Days.

ON October 7th last, L. C. Prime Company, Limited purchased from Nova Scotia a pair of cattle which were in fairly good condition weighing respectively 1465 and 1585 pounds each. These animals were purchased for making a test of **MOLASSINE MEAL.** They were stabled for thirty-four days and fed on one pint Corn Meal mixed with two pints Molassine Meal three times a day. On November 10th the animals were again weighed and tipped the scales at 1745 and 1855 pounds each, making a total gain of 550 pounds. They were sold to Mr. M. J. Collins, Fairville, New Brunswick. A copy of a letter from this gentleman is published below.

We do not propose to say anything further with reference to the quality of **MOLASSINE MEAL,** as this is conclusive proof that Molassine Meal is the best food on the market for fattening purposes.

The price is low, especially as compared with other feeds at the present time.

FARMERS! Is This Not Interesting to You? Let Us Hear From You.

If you wish to try a bag of this Molassine Meal and your grocer or nearest general store cannot supply you, we will see that it is delivered to you. **MOLASSINE MEAL is made in England.**

We can furnish you with the names of a great many satisfied customers and will be pleased to hear from any farmer with reference to it.

Letter From Mr. M. J. Collins.

Fairville, N. B., Nov. 15th, 1911.

Messrs. L. C. Prime Co., Ltd.,
South Wharf,
St. John, N. B.

Dear Sirs:—

"The pair of Cattle purchased from you were knocked down the first of the week and I am now writing to inform you that we have never handled better Beef. This Beef was equal to anything coming from the West and weighed when dressed 2185 pounds."

"I can honestly say that I know of nothing that is equal to Molassine Meal for bringing Live Stock into good condition quickly."

Yours truly,
(Signed) M. J. Collins.

Systematic Breeding of Farm Animals.

By Prof. Harry Hayward,

Director of Delaware Experiment Station.

PERHAPS no phase of Agriculture is carried on with so little system as the production of live stock. Some of us think we have a well defined method or plan of work, but lines are not closely drawn as they are, for instance, in the feeding of plants or animals. There are many reasons why it takes a little more study, a deeper knowledge of more sciences, a keener appreciation of individuality to outline a definite system of breeding than is required in any other work with which the farmer has to do. The result is that there are but few really great breeders of any kind of live stock, and when some man reaches the top, we fall over ourselves trying to buy at high prices the result of his efforts, instead of attempting to emulate the methods or system that produced the desired results.

Since the discovery of Mendel's law much has been written on the subject of breeding. Not a small part of this literature has been based upon data obtained from experiments with plants, rats, mice, guinea pigs, and rabbits. A large part of these experiments have concerned themselves with the determination of the color of offspring of parents of a given color, or some other attribute that has little, if any, bearing upon the economic value of farm animals. While I am in hearty sympathy with the investigators who are working togard the solution of our problems in breeding I feel that up to the present time, the new school has given us but few new principles that we can apply in our work as breeders. Perhaps it will be found that in order to discover the principles that underlie the breeding of farm stock, it will be necessary to work with these animals under conditions that obtain on the average well-conducted farm.

In making those statements I am not denying that present investigators are constantly adding to our fund of information, facts that help us to explain some of the phenomena that we observe each day in working with our herds or flocks. There are books by famous authors that will help in interpreting natures laws as they appear to us, and I am sure will give us a new understanding of our work, as well as inspire us to greater endeavor.

Those of you who have followed the work of Burbank and other plant breeders have undoubtedly noticed that they are constantly on the watch for new things that are pure ; that is, variations that will reproduce themselves with certainty. From these reproductions, an uncertain number will be pure in the same sense, and, by using them, a new type may be fixed. Judging from our observations in the animal world, we find existing conditions which are approximately at least, analogous. We occasionally find one animal in a large number that will breed true in one or more of its characteristic attributes. An illustration is seen in many Aberdeen Angus bulls, whose get from honored cows are very largely polled. Another case in hand, although not quite so good, is some of our noted trotting sires—particularly Hambletonian 10, Red Wilks and Electioneer.

This principle applied to animals explains why some sires are so much better and so much more potent in improving their family or strain. This is, in turn, explained by another interesting fact in the physiology of reproduction. We are told that the chromosome is the hereditary factor of reproductive cell; that the number of these differ in the reproductive cells of the various classes of animals and plants, and that there are sixteen in farm animals. When the male and female cells meet to form a new cell, one-half the chromosomes in each degenerate and disappear in order that the new cell may have the required number of sixteen. Assuming that some of these sixteen chromosomes are good, some bad and some indifferent, the value of the new animal depends upon whether the good or bad chromosomes go to form the new cell-contents which originate the new cell from which the animal grows. This explains why the offsprings from the same parents may differ so widely, and why it is that individuals of the same litter may also differ so widely.

To my knowledge, the influence of nutrition and environment upon the chromosomes and their selection has never been determined. We have reason to think that some sires and dams transmit chromosomes of better quality to their offsprings than do others. This is an individual attribute, however, and it is unlikely that it can be influenced beyond narrow limits. Occasionally, however, we see a sire that has been almost a total failure under certain conditions become a star under different environment.

There is a number of ways in which we as breeders, may take advantage of this information in our work with dairy cattle. First, whenever we are so fortunate as to find a "pure bred" animal, let us use it to the fullest possible extent in fixing a desirable type. This is the method pursued by plant breeders, and it is the method used by our greatest breeders of cattle both of the dairy and beef types. If Amos Cruickshank had not been made use of the "pure bred" Shorthorn bull Champion of England, the world would not have had the Scotch Short-horns, nor would the Jersey cattle be what they are today without the fullest possible use of the pure bred sire Golden Lad, Where this principle has been applied in practice as a means to an end, most satisfactory results have been obtained. Theoretically, it is the most direct road to improvement.

Second. It is highly probable that the best and most uniform results will be obtained when chromosomes are from cells that are uniform. Or, in other words, we may expect satisfactory results when the animals mated are of the same type and breeding, and the better the type and breeding, the better and more certain the results. A well known breeder said to me once that he had his breeding operations so arranged that when anyone wanted the best they had to go to him for it. Subsequent events, have, in the main, born out this statement.

Third. When an impure animal appears, the breeder should recognize it at an early date, lest sooner or later it pulluted the entire herd. Such an animal may even be a superior individual, but an inferior breeder. While the inferior offspring of such an individual may be and frequently is a good breeder, for the best results in the end it should not be used. In other words, to reach the ideal, only the pure animals should be used for breeding.

It should be the aim of the breeder to sell bulls, not heifers or cows. If he desires to further his own interests as a breeder, he should try to limit the number of females, and in this way keep up the demand for bulls by the dairymen who need them for herd improvement. If this argument is accepted, the breeder should try to breed his bulls so pure that they will, with little doubt, meet the demand made upon them. To do this the breeder must not only carry on his breeding operations with a definite system, but he will be obliged to keep his cows up to a high level of production. Otherwise he cannot keep up with his customers in showing profitable yields. This part of his work is easy compared with the difficulties that must be overcome in breeding the pure breed header.

It requires years of time to make a bull breeders herd, and,

unless one is willing to go into the work when comparatively young, appreciating its possibilities, and having unusual tenacity of purpose, he had better choose some other line of endeavor.

The problem is to obtain the pure sire and dam, and by selection and elimination, reproduce them with a marked degree of certainty. In the solution of this problem, there is no scientific experimental data that will aid us. There are, however, a large number of classic examples of breeders whose success is recognized by nearly everyone who is interested in the subject under discussion. Not only of individuals, but also of groups of men who have worked toward a definite end but with no concerted action.

The most notable of these, and the one with which we are all more or less familiar, is the development of the American trotting horse. This example is of special import to us because the measure of the resnlts obtained is expressed in the absolute terms of minutes and seconds. It is a notable fact that the American trotting horse came largely through one horse, Hambletonian 10. If we study his breeding, we find that he was strongly inbred to Imp. Messenger, who, in turn, was rich in the blood of Darley Arabian Godolphin and Byerly Turk, three horses that formed the arch stones in the improvement of the English Race Horse. If we carry our investigations a little further, we find that Hambletonian nicked best with the daughter of Seeby's American Star, who, in turn, was as strongly inbred to the great thoroughbred Diomed as Hambletonian was to Messenger.

The blood of Hambletonian has bred so well and has been blended so successfully that to-day the successful race horse or sire, with scarcely any exception, shows in his pedigree numerous crosses to this great progenitor of speed.

That these results have been obtained without systematic effort, all will admit, but, on the other hand, it may be said that horse breeders the country over have aimed to breed their mares to the fast stallions with little regard to their relationship so long as it was not very close, as mother to son, or father to daughter. In this way, the blood of the great progenitor has been preserved with the result that we have a breed of horses that are quite uniform in type and gait.

What has been done by the use of the blood of Hambletonian has also been accomplished in another line by the Jersey breeders on the Island through the bull Golden Lad. Many of you are familiar with the history of this great sire, and of his influence upon the breed. This blood is still breeding on and is still producing the best there is in the Jersey cattle.

Another most excellent illustration of this system of breeding is seen in the results obtained by N. H. Gentry in his work with Berkshire pigs. For the past 25 or 30 years, Mr. Gentry states, he has not purchased a breeding boar, and perhaps Gentry Berkshires are more eagerly sought than the pigs of any other breeder. Further in the recent National exhibition, Gentry bred pigs have won most of the highest prizes. Mr. Gentry attributes no small degree of his success to his system of close breeding.

The great corner stone of the breeders work has been, and in all probability always will be, like produces like, and when we have bred out cattle as pure as the birds of the air or the wild animals; or in other words, when we shall have eliminated the inferior animals so completely that they have no influence in determining the quality of the new individual, we shall have reached our objective point as breeders.

Let us then go back to first principles, emulating those who have been successful in their work, and breed the best to the best, regardless of relationships, the system that has given results and the system that will give results, if used with discretion and with due regard to environment and nutrition.

MISSOURI RIOTER

No breeding except sire.

Daughters average 4836 dams 5380 or 1044 less.

Daughters average 216 dams 234 or 18 less.

Income of ten daughters with milk at 6c. was 313 less than their dams. Fat 25c. $45.00 less.

Hugorotus. Cheap bull, not many tested animals. Ten daughters fell 3770 lbs. milk behind dams, but have 100 lbs. in fat. When the herd was culled on milk records 9 out of 11 were sold to the butcher. As long as this bull was used the herd went backward.

The next bull was Lorne Merridale. This bull was well bred and his daughters without exception were superior to their dams. This bull raised the average milk production from 4542 lbs. to 5751 lbs. and the fat from 220 to 280. At butter price the ten daughters of Lorne of Merridale returned each year $150 more than their dams. If 30 daughters of this bull had been milked six years each, their product would have exceeded their dams 2700, while the same number of daughters of Mo. Rioter would have gone $939 behind their dams, or a difference of $4639 in actual income.

The next bull used was Mo. Rioter 3d. a son of the poor bull Mo. Rioter, and this son was the only good animal he left in the herd. These good qualities may have come from his dam who was his sire's half sister, both being sired by Bachelor of St. Lambert.

The best cow ever in the herd was sired by this bull Mo. Rioter 3rd. From dams with average records of 4609 lbs. he sired daughters whose records averaged 7154 lbs. milk. The dams averaged 238 lbs. fat—daughters raised it to 348 lbs.

The daughters of this bull produced 275 worth of fat per year more than their dams. Counting this on the same basis as before, thirty cows for six years, we have $4950 worth of butter fat produced by the daughters in excess of that produced by the dams.

These figures tend to emphasize the importance expressed in dollars and cents of having a good sire at the head of the dairyman's herd. It is the function of the breeder of pure bred stock to produce for the market this sort of a sire. If some of us could forget to be dealers and speculators, we might become breeders.

If by some system prepotent herd improving bulls could be bred, with a reasonable degree of certainty, we should have no difficulty in selling them to dairymen at a profit, a greater profit than is made on the animals that are now sold, and upon which the buyer often takes a long chance.

I would say, in explanation of the term chromosome, that the units of every organism is the cell, as is well known. If this cell is stained by some analine dye and put under the microscope we notice, in the interior of the cell a number of small dots; that forms the nucleus, taken together. Each one of these little dots is called a chromosome, and they are the basis of hereditary in the cell, and they differ in different types of animals and plants. In the farm animals they are all sixteen in number.

If there is anything that the breeders of live stock lack, it seems to me it is that of a clearly fixed ideal or type in their own minds. We do not know just what we want. That is proven by going into almost any herd, flock or stud and you will find in most cases, that there is an absolute lack of uniformity that goes throughout the whole herd or flock or stud.

Amos Cruickshank was a Scotch bachelor who gave his life to the one effort of producing a type of shorthorn cattle that would pay the rent up in the northeastern part of Scotland under very unkind conditions. He and his brother were men of means, and for twenty-five years, Amos Cruickshank searched the best British yards, and wherever he found an animal that pleased his fancy or approached his ideal of a type that animal was purchased and taken to his herd. At the end of twenty-five years Mr. Cruickshank admits that he was very badly disappointed with the results. He did not have any fixed type in his herd. There was a marked lack of uniformity throughout the herd, numbering about three hundred head. About this time he purchased an old bull and turned him out in the pasture in the fall of the year with some old cows that he thought a great deal of, but that were shy breeders. The result of that crossing was a bull that pleased Mr. Cruickshank's fancy, and he called him the "Champion of England." He showed him as a yearling. He did not win first prize. He placed him in the herd, and when the calves began to come he realized that he found what he had been looking for for twenty-five years. He started out to use the blood of "Champion of England," bred him to his own daughters and granddaughters and took his sons and crossed them upon their half-sisters and so forth. In that way he fixed a desired type of English shorthorn, which is to-day the popular and most desirable, the most economical type of short-horn that we have, and from that line, in the Jersey cattle, has come "Golden Lad." You all know what Golden Lad has done towards improving the type of Jersey cattle.

We have outlined at the Experiment Station one breeding problem with hogs, sheep and cattle, and I hope with horses on a small scale. We have been doing work along this line with hogs for four years, and have some animals that are very closely inbred. At the present time we have a young sow that farrowed when eleven months old and she contains sixty-two per cent of the blood of her grandmother. Her dam contains seventy-five per cent. of the blood of her mother.

We bred this sow to her half-brother. These pigs contain 56.25 per cent. of the blood of their great, great, grandmother. They had more of the blood of their great, great grandmother than if she was their own mother. These pigs are as near alike as peas in the pod, and are one of the most fashionable types of Berkshires today. We have other examples where we have had our crosses, and we got no more pigs in the litter and they are not nearly as good individually as these promise to be. So far as results go, we have seen nothing to adversely effect very close breeding with pigs. I have taken pains in every case to mate only the best individuals that we possibly could raise, and cut out entirely, disposed of entirely from the herd the pigs that did not meet our ideal.

Mr. Snavely. Do you believe that the Jersey breed has in any way been affected by inbreeding?

Professor Hayward. No, I do not. I presume that you have in mind the difference between the inbred Golden Lads and the inbred American cattle. You will find among the American cattle instances of very close inbreeding. I can cite you animals that were intensely inbred, and those animals have been prize winners in our largest exhibitions.

(Professor Hayward cites two Jerseys in the St. Lambert cattle, which were closely inbred, and which were noted for their size, ruggedness and ability as producers.)

Mr. Williams. Is there any lack or virility in breeding in that way? You are familiar with the law in Pennsylvania, for instance, which prohibits the marriage of first cousins.

Professor Hayward. Yes, and I think a great many of us get confounded because we always cite the human race. In the human race we have no possibility of selection. With the animal kingdom we have. With the human race we cannot control environments; with the animal kingdom we do have control. Close breeding does not affect the fecundity of animals. While Dr. Pearl was in Holland, two years ago this summer, he met a very wealthy merchant who had a hobby of breeding poultry. He started raising poultry and divided them into two lots. He bred them both very closely in and in. In one lot he selected only the best individuals for mating, and in the other they were taken haphazardly. He studied the results of quite a number of years' work. He had one strain which was rugged and strong and profitable, while the other strain all went to pieces. In a number of instances in America we have had men who have practiced in and in breeding. For example, Mr. Huntington, of Arab horse fame, bred in and in as the end of the work, to be accomplished, not as a means. He mated animals together without careful selection of the individuals, and he got lots and lots of weeds. People point to such experiments and they say that in and in breeding does no good. They forget the Cruickshanks, the Bates, the Gentrys and the Prices, and those men who have written their names high on the wall of fame, and who have done it by the system of breeding in and in intensely, but mating the good animals, the best of the best, regardless of relationships. Those men had a type, an ideal for which they worked. When they found two animals of that ideal they mated them together, regardless of their relationship.

Mr. Brady. I understood you that the purpose of the breeder was to produce bulls. I think I must be the champion breeder. I have a perfect score of one hundred per cent. of bulls. I presume that might be explained on the Guernsey theory of the potency of the Guernsey sire. I want to know how to get the heifers. I have heard and read a good many theories. I would like to ask whether there are any facts other than theory which go to establish a law.

Professor Hayward. There are many theories which have been advanced along this line. The man who has done some work along the determination of sex was Dr. Schenck, of Germany, and he worked with the human family and produced one very notable result. That was with the Czar's family. He has since died without doing anything further in that line of work. The best biologists today tell us that there is absolutely no way of determining sex; that it is simply a matter of combination of these chromosomes or something of that kind that takes place in the formation of cells and which cannot be controlled. It is a matter of chance largely. Take a number of sires, work it out mathematically, and you will find there are a great many possible combinations, and some bulls apparently produce a maximum or majority of one sex and some a majority of the other. I understand that in herds or in flocks where close records have been made for a number of years, at the end of a given period of time the results balanced up and there may be one or two per cent. difference in the number of animals of the different sexes, but they are practically the same.

Mr. Vaux. The Wister Institute in Philadelphia is conducting at the present time possibly the most complicated and elaborate series of experiments on the question of sex determination that have been conducted

anywhere in the world. They are being done with two classes of animals, frogs and white rats. We have in Wister Institute I forget how many thousands of white rats, but we have a number of white rats there for biological purposes that are equal to any that you will find anywhere in the world, civilized or uncivilized. These experiments have been going on for a number of years. They cover a great variety of conditions, and they go into what the ordinary mortal, in his ignorance calls vivesection in connection with them. Up to the present time absolutely no definite results have been indicated.

Professor Hayward. I might cite one illustration of what is being done along this line to determine where the seat of hereditary is and how it was worked out. Dr. Castle, whom some of you have heard talk, is working under the Carnegie foundation on Hereditary in connection with Harvard University, and has produced most interesting results, theoretical results that apparently have no good in them, at least most of them have no apparent economic value. They found when they mated two Albino guinea pigs, the result was always an Albino. They took an Albino female before she was matured, and removed her ovaries, and then took the ovaries from a black guinea pig and grafted them into the white Albino. They had an Albino guinea pig with the ovary of a black guinea pig. This white Albino guinea pig with the black guinea pig's ovaries, was mated with an Albino male, and you would have thought the result would have been a white guinea pig, but they got a black one. Every time that they found that the black is dominant over the white in guinea pigs. It is just the reverse in pigs and that shows that in that case the color, at least, was fixed in the ovary, determined by the ovary.

Metal Buildings and Lightening Protection.

Protection from lightning is a subject that recurs with the coming of each spring time. In the violence of an atmosphere electric disturbance, accompanied by the awe-inspiring flashes of lightning so common with thunderstorms, there are few who have not desired the protection of a lightning-proof shelter. The probability of an individual building being struck by lightning is really very slight, but there is always a possibility of such an occurrence, and also that the stroke might be attended with considerable violence, or the building might take fire.

HOW LIGHTNING CAUSES DAMAGE.

The formation of lightning is very imperfectly understood, but experience with its vagaries and a knowledge of the laws of high-tension electric currents has established a fairly good understanding of the methods of constructing lightning conductors for all granary, so common in the West, ordinary discharges. It is very well known that lightning is the discharge of a large amount of electricity in a very short space of time, and that whatever affords it a passage to the earth is likely to be badly damaged, unless the vehicle happens to be a good conductor of electricity and of sufficient size to transmit the amount of electric energy the flash contains, in which case it passes away, doing no damage at all.

As a storm develops, the electrically-charged clouds pass over the earth, and when the electrical intensity becomes great enough to break down the resistance of the intervening air, the resulting discharge will pass into the earth by the most convenient path. This is commonly some high object of the landscape—a building, a pole, a tree, or any other object that extends up from the earth. If the object is a conductor of electricity, and connected with the earth, the lightning will pass into the ground without the least damage being done, but if it is not a good conductor, the havoc wrought in an instant is sometimes appalling.

VALUE OF METAL-ROOFED BUILDINGS.

Buildings with metallic roofs that are properly connected with the earth have better protectors from lightning than could be given by rods. Buildings that are completely covered with sheet metal and well connected with the earth are practically lightning-aroof. Covered in this manner, proof. Covered in this manner, peatedly struck by lightning, without the least damage. The sheet-iron when well connected with the earth, may be considered lightning-proof. The ground connections mentioned above may be made of metallic rods that extend well into the earth, and securely fastened to the metallic covering of the buildings.

In considering the form of lightning conductors, it is well to keep in mind the fact that a metal-covered building well connected with the earth is practically lightning-proof, and that one with a metallic roof, well grounded, is excellently well protected, if not perfectly safe. If, then, the roof of a building possesses a metallic ridge, eaves-troughs and down-spouts, these will afford very good protection if they are well connected anh well grounded. A roof covered with a metallic screen, as a chicken screen, makes an excellent protector when properly grounded.

It must be remembered that the ground connection is a positive necessity, and too much care cannot be exercised in its construction. The earth is the great reservoir of electrical energy, and is always kept at zero potential. If a discharge of lightning can be directed into the moist earth by a conductor, its energy is soon dissipated, but the ground connection must be of considerable area, and extend well into the moist earth. A piece of galvanized iron pipe driven into the ground seven or eight feet makes a good "ground." Large buildings must have two or more such "grounds."

SIZE OF CONDUCTING WIRES.

In the matter of conducting wires, the United States Weather Bureau, in a bulletin on Lightning and Lightning Protection, recommends a No. 3 galvanized-iron wire as a ply sufficient in size for ordinary lightning protection. If metallic down-spouts are used as conductors, the connections should be made with the "grounds" with riveted joints. Copper conductors give no better protection from lightning than iron, if the iron is kept covered to prevent it from rusting.

Wire fences are often the cause of damage by lightning because of the method of construction. If the fence wires are grounded, the danger from this cause will disappear. Ground wires may be made of ordinary fence wire, and should be connected with each of the wires of the fence, and extend into the ground three feet. Such "grounds" should be made for each 100 feet of fence.—E. S. Keeney, Professor of Physics and Mechanical Engineering, in "Metal Worker, Plumber and Steam Fitter."

Spraying in the Vegetable Garden.

Does it pay to spray potatoes in New Brunswick? Does it pay to spray celery? Growers have been asking these questions for many years, while some others have neither asked nor thought about it. They have been growing potatoes as their fathers did, and really do not know whether the potato industry is a profit or not. We are well aware that in some sections up-to-date methods of spraying are practiced, but the great mass of farmers outside that section spray for the potato bettle only, while the various forms of fungi run their course without molestation, and when his crops are "struck with rust," he says: "Farming does not pay."

The truth is potato blight, which causes rotting of the tubers, is as easily controlled as the potato beetle if spraying is done in time. If applied after the plants are attacked, it is usually too late. The commonest and best fungicide for potatoes is the Bordeaux mixture—at least our experiments would so indicate. The best way of making is well known, viz., four pounds of bluestone, four pounds of quick-lime, forty gallons of water. The bluestone is dissolved in one barrel containing twenty gallons of water, the lime in another containing twenty gallons. These two are then poured together. The resulting mixture is Bordeaux. Care should be taken in straining the lime lest there be difficulty in getting the mixture to pass through the nozzles of the spray pump. Paris green may be added to this and the beetles and fungi are thus controlled at the same time.

When the farmer speaks of the rust on his potatoes what does he mean? When he sprays what does he hope to do? The "blight" of potatoes is a plant. True, it is a very low form of plant life, but a plant just as surely as the potato, buckwheat or oat is a plant. The body of the plant consists of threads. These threads throw up little stalks and are known as fruiting bodies. These contain numerous bodies called spores. These spores have the power of reproducing themselves just as seeds do in the higher plants. They are very light, so that they are blown by the wind from place to place. When these spores fall on the leaves of plants, they germinate, that is, they grow. They have no power of taking up plant food and using it as the higher plants do, but they are fortunate in being able to take up food manufactured by other plants and feeding on it. Thus they are true robbers, or parasites in the vegetable kingdom.

Just as oats would not germinate if placed in kerosene oil, so the spores of many plant diseases cannot germinate in Bordeaux mixture. If the leaves of plants are coated with this substance, spores falling on the plant fail to develop, but little value comes from the application if put on after the disease is within the tissue of the plant, for then it cannot be reached by the spray.

Two forms of "blight" attack potatoes, the early and the late. The early blight was described in 1882. In New Brunswick it may be found from July to the end of the growing season. This is often mistaken for "tip burn." Tip burn is simply a burning of the tips of the leaves in very dry weather, owing to the evaporation being greater than the moisture supply. Early blight may be distinguished as follows: The spots are brown, circular or elliptical, and are distinctly marked with target-board markings. Leaves attached by flea-beetles are especially liable to attack so that flea-beetles and early blight usually go hand in hand. The losses caused by early blight are frequently heavy but this is not usually the case.

This fungus causes no rotting of tubers, but arrests the normal development of the plant, and a consequent lessening of the yield. The late blight is much more serious. It is a very old potato malady and has caused great disaster in many potato growing regions. The serious famine in Ireland was very largely due to the failure of the potato crop, because of the prevalence and unusual destructiveness of this disease.

Blight is not caused by warm moist weather as many suppose, but warm moist weather favors its development. Oats will not germinate if deprived of heat and moisture. The spores of blight are equally dependent on these climatic conditions During a warm moist season in autumn whole fields may be devastated in a few days. Very high temperatures quickly check its spread. The characteristic purplish tint of the leaves, together with their water soaked appearance are usually sufficient to identify the disease. The odor arising from the affected field is well known to everyone. This disease gives rise to dry rot, and not the soft rots, which are usually bacterial in origin.

Very often the late blight does not make its appearance. At Macdonald College this year we had none and expected none (the year being very dry), yet we sprayed. Apart from the insurance which spraying always gives, we are confident that it pays, when there is no blight, in increased yield. Bordeaux mixture acts as a tonic to plants. It certainly stimulates plants to greater activity. Just why we do not know. The foliage is greener owing to increased amounts of green coloring matter, which is an important factor in starch production, and the tuber gets the benefit.

Celery is seldom sprayed. Without spraying, however, the whole crop is often a failure. This year we kept the spray pump going in the celery field. The leaves were kept coated so that the spores were not able to develop as they would have done. Even with this it was questionable at one time whether we could save the crop. The row not sprayed (left by way of experiment) was valueless, while the sprayed was of good quality.

In vegetables, as in fruit, the New Brunswick farmer must accept the verdict: "Spray or surrender."—E. M. Straight, Macdonald College.

Good Sheep Story.

Here is a good true sheep story: Two boys, Lewis and Cyrus Cram of New Sharon, were given three lambs by one of their neighbors—two ewes and one buck. This was in February. They taught them to drink milk out of a dish, and after they were two weeks old began to give separator milk, and grain as they got older. When the grass got good enough, these lambs went out to pasture and were not fed milk or grain after that time.

In December the buck was sold for ten dollars. In February, when the ewes were one year old, they had two lambs, which were sold in August for $10.05 At shearing time, one ewe sheared 12 pounds, the other 17 pounds, which at 20 cents per pound would be $5.80, making an income of $25.85 out of the three little lambs in one and a half years, with the mother sheep left. One of these has a fine lamb two weeks old by her side. The other will soon have a lamb again, making twice in one year for both of them. These lambs coming now will, no doubt, bring $25 by the time these sheep are two years old. Can any of the boys beat this?—W. A. G. in Main Farmer.

We have received the announcement of the marriage of Miss Laura Rose, Guelph, Ont., to Mr. W. F. Stephen, Huntingdon, Que.

Miss Rose is well and favorably known throughout the dairy world as an ardent teacher and advocate of up-to-date profitable dairy methods. Her book on Farm Dairying should be in every farm home.

Mr. Stephen needs no introduction to our readers. He has been judging at our Maritime exhibitions for many years and has always given universal satisfaction.

The Maritime Farmer wishes Mr. and Mrs. Stephen a happy and prosperous career.

Something Concerning the City Milk Supply.

By Neil Roach, Kentucky.

THE CUSTOMERS.

IT is a well-known fact that it not only requires elbow-grease to run a herd of cows, but brains and thought; and it is equally well-known that to be a city milk dealer only requires a bunch of money, some horses and wagons, and a few bottles. Brains are not needed, for the customers will run the business. All the milkman has to do is to sit back and pocket his losses. The greatest trouble comes about, however, in that the customers, not being properly organized, present their suggestions independently and with no accord or system.

What Mrs. A. deems absolutely essential, her next door neighbor thinks "perfectly atrocious." Mrs. B. is convinced that children should not have rich milk, while the lady across the street is not satisfied at all unless the cream line is mighty near the bottom of the bottle. Mrs. C. thinks all well-conducted milk concerns should follow up each driver and see that he not only knocks but calls out "Milk!" when he puts down his bottles and her best friend "will positively not deal with a house who don't know better than to make such a fuss." Mrs. D. is a new member of the humane society and is constantly on the lookout for abuse or unkindness (fancied or otherwise) to any horse that delivers at her home, while the woman in the apartment above thinks the arrival of her milk on the minute is certainly far more important than any mere animal.

One day last February a sleet came up suddenly during delivery hours, and it was necessary to stop the wagons midway their runs and send them to the nearest blacksmith shop to be rough-shod. It happened that a customer saw one of the wagons turn back just before reaching her. Almost immediately our office 'phone rang and she wanted to know why. The matter was explained. "Well!" she said, "I should think you would at least have had business sense enough to have attended to that last fall."

Of course all these things are the humors of the businesss. As a matter of fact the majority of customers do appreciate good milk and good service; and though their suggestions may sometimes sound funny to us, and our methods and rules no doubt arbitrary on occasions to them, on the whole it is true in this work as in any other that courtesy and fair dealing evoke a like response.

FRESH DELIVERY.

The real problem of the milk business is the milk. It would not be very farfetched to paraphrase the old proverb and say: Take care of the milk and the milk business will take care of itself. Of course this is not literally true. The marketing of the product, with all that that implies in obtaining the customer, dealing with him, handling the necessary labor, managing accounts and whatnot, is a complex and exacting undertaking. And of course in my work—"certified milk"—the customer has to be educated to begin with. But the fact remains that if you have good milk you will get the customer. And of course good milk is what we are all trying to put out.

On the farm it is difficult to realize that in the cities there are many persons, particularly children, who have very amusing notions as to what milk is. Recently the New York Park Board, as a matter of education, put a cow in one of the parks, in order that the children might find out that milk was not made in a factory and that it came from some other place besides a wagon or a bottle.

In many foreign localities, to be sure, even the most crowded, the cow is a comon sight. My first daylight glimpse of Europe years ago came when I was waked in Naples the first morning after landing by an argument under my window between a milkman and a customer. In the street stood several cows, one of which had just been milked; and the argument was as to whether or not the foam ought to count. The milkman said "Of course!"—"Not on your life!" said the customer; and finally in his utter contempt for such airy stuff as return for hard-earned soldi, with one gouge of his dirty finger he scouped the foam from the measure and shook it into the cobble-stone.

It is not always the cow that is made into the animated milk-wagon however. In Barcelona it is likely to be the goat, in Havana the donkey, or in Canton the buffalo. This is an effort to deliver the milk fresh, and even, it might be said, in the original package—a somewhat misdirected effort, however.

It is a rather nice question what constitutes fresh milk. Milk as it comes from the cow is still a living part of a living creature, and it is in this condition incidentally that it is at its best as food. Moreover, as a living thing it has in itself certain powers to resist infection—from bacteria of the souring kind, of the putrefying kind, of the disease types. If overloaded with bacteria through having been contaminated with dirt and allowed to stay at a temperature which is particularly suited to the growth of bacteria, its life is soon spent in a frantic effort to rid itself of the invaders.

If, however, it is milked in surroundings and under circumstances that practically preclude contamination, and is then cooled below the temperature that conduces to the growth of bacteria, its life is prolonged over several days. Consequently milk that has been properly milked and handled is fresher at 48 hours than dirty milk two or three hours old, though of course the right sort of milk two or three hours old is better than either. Thus the problem consists in getting the milk from the cow to the city in the best shape and the quickest time. And more and more in the future, the producer whose farm is so situated that he has neither frequent nor quick service to the city will find himself at a disadvantage.

Another thing that solves the problem of freshness is the bottle—that is, delivered in the original package. It was a great step in advance when the city dealer began to bottle his milk in the quiet and comparative cleanliness of his own plant instead of drawing it from a faucet-can into an open measure amid all the blowing dust and hurly-burly of the street. But it is a greater one that many dairymen are now beginning to bottle the milk, themselves, within five or ten minutes after it is milked, and then selling it, so that it is not again exposed until it is opened for use in the customer's home. The bottle can be iced so much better than the can, too, during shipment and delivery, And that is another point in its favor and as a help toward solving the problem of freshness.

In the minds of many city people, as I said before, milk is associated more with the bottle than with the cow; but, though this country bottling of milk is beginning to bring the bottle to the country, it has done so as yet, only as a matter of city requirement, and, indeed of finickiness, as is shown by the entire community around one of the certified dairies when it first started speaking of its product as "certified milk!" I sincerely hope, however, that the day is not far distant when even the farmer with one family cow will see to it that her milk is properly drawn, quickly cooled, and immediately bottled and sealed, and kept so—covered and cold—until needed for use in his own house.

CLEANLINESS.

It used to be that the city milk consumer was easily taken in by mere utsubstantiated claims to "pure" and "sanitary" in connection with his milk, while nowadays it is more apt to be fancy city plants or expensive dairy buildings that impress him.

Real cleanliness in the dairy is costly. Not that it takes such elaborate equipment, but that there must be the most minute care from the proprietor and every employe, so that it requires a higher class of labor than can be afforded when working under slipshod methods. It requires more men, more water, more hot water, more steam, more ice. It requires a higher class of intelligence, or at least the application to that particular work of a higher class of intelligence than has usually so far been devoted to it. But above all, it requires a keener sense of social obligation, a thoroughly-awakened conscience, and absolute honesty and integrity of purpose.

THE BABIES.

I do not believe there is a dairyman in Kentucky who would not risk his life in an effort to save a baby or small child from danger. It is only the failure to realize what he is really doing and what is really involved that lets any honest man go on in ways and with methods that when you come to the point, actually endanger children. And yet it is true that a large percent of the appalling infant mortality of the United States can be and must be laid to the milkman. Dirty milk—that is, milk running a high bacteria count—is responsible for a great number of infant deaths from diarrhoea.

Please notice that when I say dirty milk I don't mean merely milk that looks dirty, but milk that has been contaminated in any way. It may be visible, it may be invisible. The visible dirt may be taken out but the harm it has done remains. Manure, hairs, flies, etc., are not appetizing, to be sure; but they may not actually be any worse than handling and exposing the milk in bacteria-laden air or letting it stand warm.

There is no way in which milk can truly be cleaned of either the visible or invisible dirt. The only way for it to be cleaned is for it to be clean and kept clean from start to finish. If milk were as transparent as spring water the bacterial growth would show, the milk would become cloudy and eventually opaque, and bacteria-laden milk would cease to have sale. The fact that clean and dirty milk both look so nice and white has led many to scoff at this whole idea of clean milk, and many more to be careless.—Neil Roach.

Fence Gossip.

Any man who keeps stock should have good fences and strong gates. Broken down fences and old dilapitate gates are a constant source of annoyance and danger. Many valuable animals are injured by broken fences and gates, not always by the fence or gate itself, but by getting through the fence or gate into a field of grain and eating enough to cause bloat, or by strolling on to a railroad track and being hit by the cars.

Perhaps the whole herd breaks through into a neighbor's fields and destroys his crops. Such things are mighty unpleasant, and cause bad feeling among the best of neighbors.

Good fences and strong gates are cheaper than good stock and damage suits. Good gates and fences add to the permanent value of a farm. If a man has not sufficient pride in his farm to keep up his fences, economy should compel him to give these matters attention.

It is poor economy to allow a pure-bred cow to break through a two-dollar gate and get with calf to a neighbor's scrub bull. The poor gate is the weakest link in the fence. There is nothing that adds more to the appearance of a farm than good, substantial gates and fences. Such appearances amount to hundreds of dollars if we are selling our farms.

Workmanship as a Factor in Buttermaking.

By Prof. Carl E. Lee of Wisconsin Dairy School

A few years ago very little thought and consideration was given to workmanship as a factor in buttermaking. This might have been due to the grade or quality of the raw material which was to be made into butter. Milk in its pure wholesome state will make butter of excellent quality even in the hands of the man, who employs good judgment only. Since this natural quality has been to a greater or less degree destroyed by lack of workmanship on the part of the producers, it falls to the manufacturer to do his work well in order that it may act as a counter balance.

Never in the history of buttermaking has there been such a demand for skilled and exact labor as today, and every year will emphasize this to a greater degree.

The average creamery buttermaker is a better trained and a more exact man than has ever been found. The various forces at work to hold the quality of butter to a long fixed standard have never put forth greater energy. Each year finds better equipped factories. In spite of all there never was such a demand from the markets for butter with the quality of ten years ago. It must be admitted that the creamery operator in those day needed as much knowledge of the factory controlling flavors as is demanded today, but the conditions of the raw material could not help but produce the grade of butter that gave general satisfaction. When a few lines of butter were off, the cause could partly be attributed to the untrained operator. Why is it that today, the students in buttermaking are often heard to remark, "Give us the whole milk and we will show what can be done ?"

The commission merchant or consumer does not demand butter of higher quality than formerly, the standard has remained the same; it is quality that has changed. Why ? The flavor of the finished product no matter what its treatment may be at the hands of the manufacturer will not lose its identity. The creamery that has been buying one, two or three different grades of cream will give to each the best treatment possible, and yet the finished product called butter will be grades one, two and three.

Let it not be understood that butter made from whole milk is never defective. When it is not perfect it is because the buttermaker did not do his part in guarding against those factors which destroyed flavor or produced taints.

The object of this article is to discuss those factors which tend to always produce the 55 points of the score card, aside from flavor. If it is possible to manufacture butter that is perfect aside from flavor, a great deal will have been accomplished to offset a portion of what has been lost in flavor.

As stated above, workmanship counts for 55 points out of a total of 100. When referred to technically, flavor, therefore, is 45, but when butter is handled on the market it seems as if the points should be reversed or over three-fourths of the scale of points should be credited to flavor.

It is a deplorable fact that greater efforts are being put forth to train men to become fine workmen in the art of buttermaking and let the main factor which governs quality receive so little attention.

During the past year paragraphs have been inserted in the scoring exhibition articles calling the attention to the great need of better raw material. This has not been done with a view of shielding the faults due to lack of workmanship on the part of the markets. The facts were stated that an interest might be awakened which would result in better cream.

Wisconsin, until a few years ago did not realize what effect the changing from whole milk to farm-skimmed cream would have upon the quality of butter. The reaction has come and unless we see in the near future a combined effort for better raw material Wisconsin will not rank first in quality of butter.

WORKMANSHIP MUST COUNT.

Since the quality of the raw material bears a direct relation to the flavor of the finished butter and is it so difficult to get the clean flavored cream, workmanship must be made to count. The man who is employed in a factory that receives nothing but whole milk has many things in his favor. It does not demand such skill to produce a product that has a rich, clean creamy flavor. The condition of the raw material in this case counts for nine points and workmanship one. When the flavor of the cream is off or tainted and at its best will not count for more than one point, the operator is often asked to make his skill cover the other nine.

The demand of the creamery operators is for men who can take the raw material and make a grade of butter that will pass as table goods. Formerly, if the butter was a trifle defective in flavor, body, or salt, there still was a margin, and it would pass as "extra". This is not true when flavor in itself will barely count for 38, then in order to pass as an "extra", it must be perfect in workmanship.

Several things could be brought out pertaining to the buttermaker's part with reference to flavor in butter but time will not permit.

BODY IN BUTTER NECESSARY.

At times there seems to be more or less butter produced with defective body. There has been a larger per cent of it of late years due to the general agitation of high overrun and moisture to be obtained by using abnormal methods. These methods have had their injurious effect upon the body of the butter, even if they have not produced the other desired results. These extreme methods have run their course in Wisconsin, consequently there should be a general improvement. At certain seasons of the year, it is trifle more difficult to control body. A creamery operator, who is observing, can tell when a change must be made in temperature, control the handling of the churn or the method of working the butter, to avoid this defect. Butter without a perfect body is not attractive ; in other words, it lacks life. A certain line of butter may have flavor, but in appearance it is dead and the grain is short. This is not due to the condition of the milk or cream, but rather the butter was handled at too high a temperature, worked at intervals when temperature was too low or else excessively worked even when ideal temperature had been maintained. The total number of revolutions the butter is worked or passed between the rollers of the churn is not just what it is worked after the salt is added, but the total of all working before and after salting. The working of butter before salting should not be encouraged for general use. If butter is worked 20 revolutions after the salt is added and it had been worked half that number before salting, the result would be the same as if it was worked 30 revolutions after salting.

The body must be firm and waxy. It can be maintained at all seasons and under all conditions if the sole object in view is body.

DEFECTIVE COLOR CAN BE PREVENTED

Butter with defective color is found too often and at times causes quite a loss to the faetory if paid for on its market value. This mottled or unevenly colored butter is one of the hardest to sell. Not every retail dealer is a critical judge of flavor, therefore, at times he can be persuaded to buy better not up to standard in this respect, while this same man when he sees a trier of butter pulled from a line that is mottled, be it fine in flavor, will at once pass it up.

Mottles or this uneven color in butter is under the control of the maker and if it is found in a day's make, the cause should be at once located.

The above statement is based upon facts derived partly from the result of dealing with the members of the scoring exhibitions. During the past season the number of packages defective in color has been reduced from forty per cent in May 1909 to five per cent in May, 1910. If the method blank is filled out in detail it is as easy to locate the cause for mottles as excessive water and salt content.

The other reason for stating that mottles are under control is based upon data which shows that they are produced at will. An exhibit of this kind was arranged in one corner of the butter refrigerator at the last Wisconsin State Fair and is also one of the exercises used in creamery buttermaking courses.

Butter with a uniform color can be made regardless of size of butter granules, temperature of churning or wash water, whether butter is washed or not washed. The make of the churn has no influence on mottles. Butter to which color has been added or which has been churned without the addition of color can be made so as to be either perfect or defective in color.

Mottles can be produced at will in any churning desired by a difference in the amount of working to which the butter has been subjected after the salt is added. Mottles bear a relation to the temperature at which butter is held or stored, but butter can be made to have a perfect color at churning room or even freezing temperature.

The secret of making butter having a uniform color is the sufficient working of the butter at an ideal temperature with reference to producing an ideal body. It has also been demonstrated that a small amount of free water in the churn at time of working favors a uniform color, with less amount of working. That butter in the granular state as compared to a large mass at the time of adding the salt is less apt to be defective in color.

REASONABLE AMOUNT OF SALT IS NOT SUCH A GREAT FACTOR.

The amount of salt with reference to market conditions and requirements is not as great a factor as is color, although there is a limit which must not be exceeded. The condition of the salt in the butter bears a relation to flavor, when the flavor is trifle off, judicious salting is beneficial while butter can be injured by oversalting.

The demand of the market is not that the salt content be either light or heavy, but that it be fully dissolved and entirely free from grittiness.

Most men interested in butter have noticed that when certain lines of butter are opened for examination, aside from flavor, one will get a desirable or undesirable impression of the butter. This is mainly dependent upon amount and condition of the salt.

It is an easy task to make butter perfect in salt, but it cannot be easily accomplished when the salt content is high or even exceeds four per cent. Perfect salting is produced when conditions are favorable for the uniform mixing of salt and it is all dissolved in the finished butter.

Dr. F. B. Hadley, of the veterinary department of the Wisconsin College of Agriculture, is warning stockmen against the possibility of poisoning animals by feeding frozen beets to them. It seems that last year a considerable loss was sustained in Wisconsin from this cause, the greatest trouble resulting from beets that had been thawed, after having been frozen, before being fed. Recent investigations show that the chemical changes that take place in the process of freezing and thawing produce a poisonous substance which may cause rather sudden death when eaten.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

THE DAWN OF 1912.

The twilight of the closing days of 1911 is past and gone. The old year has closed and the jovial new year 1912 has dawned. Are we all striving to live better and do better and thus live up to the resolutions that perchance we may have made during the closing days of the old year ? As we reap so shall we sow, is an adage that holds true in every walk of life. Let us so conduct ourselves during 1912 that when it draws to a close we can surely say, "We have done our best." No one can do more.

A TALE OF THREE.

Once upon a time there were three boys raised on a farm and they were all ambitious youths, anxious to get on and make things hum. Now ambition is another word for discontent, but there are several ways in which one can gratify one's discontent. The eldest, whose name was John, hated what he called the dull monotony of country life, the chores of the farm, and the lack of opportunities for advancement, and he worried his parents into sending him to a technical school in the nearest city, where some hard work soon qualified him for a post as bookkeeper in a large store. The second son followed his brother's example, and did not rest till he also found himself in town, safely lodged in a billet as clerk in an office. The two elder sons, thus, it will be seen, both got what they were after.

The third and youngest son was looked upon with a sort of humorous pity by the others, as the fool of the family. It was true he worked hard, but he had little to say for himself and seemed quite content to stay on the farm. Why trouble about him ? He would do all right where he was. But No. 3 was, as has been said, quite as ambitious as the rest. He liked country life, and could find many pleasures both in nature and in his work. More than once he attended short winter courses at the nearest agricultural college which taught him many ways of improving his farming. This led him on to subscribe to agricultural papers, which kept on teaching him more. When his father died he got the farm, encumbered with the mortgage that had been raised to help his brothers. But the ambition of which he had his full share was spurred on by the consciousness that he was working for himself, that every stroke of work and every bright idea put into practice meant dollars put in his pocket and not in someone else's This was a big asset not in the possession of either of his brothers, and it induced him to work early and late, and to employ his brain as well as his hands. Farmers who do this are not long troubled with mortgages as a rule, and so it proved in this case.

There is no need to follow him through all the steps of his career. He had his difficulties in plenty, and grappled with them all, while our friends in the town spent their evening in slippers sucking a pipe. He is an independent farmer and growing in wealth and influence, while of his brother's the one is a book-keeper, and the other a clerk.

DEVELOPING COMMUNITY SPIRIT

The proper development of the community spirit in a neighborhood can have but one logical conclusion—it will result in undoubted advantage. The world in general has long since realized the benefits of co-operation, and in some respects this is true in the farming world. Take some common concrete instances seen in the routine work of the farm. By trading work during the threshing season, each farmer has his grain threshed with much less trouble to himself than if he had to hire all the necessary help. The old-fashioned quilting bee is another homely illustration of the spirit of co-operation. Brown may exchange work with Neighbor Jones in haying. These simple instances are given little heed by the average person, yet they show that the spirit of co-operation exists in every neighborhood. Many times efficient leadership is all that is needed to make this fact of co-operation a power for good in developing a strong community spirit.

There is a part of a township in southern Iowa that shows the results of one man's leadership in establishing a community spirit. This man has always had as much work to do as any of his neighbors. He nevertheless found time to keep the half mile of road adjoining his farm dragged, no matter how busy he was. The weeds in and along this stretch of road were mowed regularly. The weeds along the fence rows were mowed and the corners cleared of rubbish. The fences were kept in good repair. The liberal use of paint made the house and barn attractive. A well-kept lawn and premises made the place doubly attractive, as compared with the other farms. The work this man did was pioneer work, but it was pioneer work that paid. The visitor in that neighborhood today can scarcely fail to be impressed by the air of neatness and prosperity that pervades the whole community. The community spirit of pride in the appearance of the farm was developed through the silent yet effective work of one man. The instance given should be duplicated in one way or another in many communities. The spirit may be shown in the development of a certain type of grain or of live stock. In a certain county in Wisconsin the Guernsey breeders are proud of the high-producing herds that have been developed. No man can live long in that neighborhood and be contented with a low producing herd. In this instance the community spirit has worked untold good for the dairy interests. The community spirit makes far better farming and far more profit. It is the outgrowth of the underlying spirit of co-operation that should prevail in farm life today. The farmers in the neighborhood can well afford to sink minor prejudices in race, religion or what not to the end that general good come to their community. Community pride in well-dragged roads, in well kept lawns, in real dairy herds, or in whatever makes for better country life or more efficient production is certainly worth cultivating.

PLEASURES IN HOME MAKING.

Those who own their own homes and take pride in beautifying and embellishing it are worthy examples of good citizenship to the young people of our country. The life and character of home builders are usually worthy of emulation and seldom fail to place high ideals of home living before the youth of the neighborhood.

The discontent and dissatisfaction of living in rented homes and of adapting one's self to the inconveniences and discomforts of other people's plans are responsible for much discord in the home and often result in worry and vexation that may lead to broken health. Renting may cause carelessness and untidiness and it certainly does not stimulate originality in home arrangement and pride in the appearance of the farmstead.

Those who must live in rented houses should make the best of their surroundings and strive to become home owners. This may require many years of toil and perhaps necessitate hardships, but it is worth all that it costs. When the home is finally owned, the cares and deprivations in acquiring it are soon forgotten, the enjoyment all the more apparent. Things easily achieved are not fully appreciated.

There is no more dishonor in renting a farm than in renting a store or place of business in the city and many business men find renting profitable. But the advantages of owning a farm and making a home on it are so many that every farmer should strive to become an owner. The children will take more interest in building up the farm and beautifying the home when it is owned and will be glad to help pay for it.

Call a council of your wife and children and make your plans to buy a farm and make a home on it.

Ways and Means of Facilitating the Distribution of Registered Seed in the Maritime Provinces.

This subject, in its many phases, is one of the greatest questions before both seed growers and farmers at the present time. Yet one must not infer that there is an over supply of registered seed, even in proportion to demand. Hence, the phase of this subject upon which I lay greatest stress is "How can we so influence the farmer that the present supply may be totally inadequate." Upon careful inquiry from the majority of the Maritime C. S. G. A. members regarding the registered seed trade, I find the following facts: 1st. Amongst about 60 per cent. of the selectors the demand far exceeds production; whilst less than 40 per cent. report an over supply. and these are largely young members, who also report increasing sales. 2nd. Average prices for the past year for registered seed were oats, 90c.; wheat; $1.50 to $2.00; barley and peas, 3c. per pound and potatoes $1.00 to $1.20 per bushel; all sufficiently profitableon large yields as in 1910, yet very reasonable for purchasers. However, some of the best grain was unsold at even lower quotations. 3. Local demand, i. e., purchasers amongst neighboring farmers, amongst 90 per cent. of selectors is reported light, but interest in and demand for this seed locally is increasing. 4. Even under present limited conditions, there is amongst progressive farmers a too large amount of purchasing from a distance, when a neighboring selector could give as good seed, with the added advantage of acclimatization. 5. We may always expect to find a large number of farmers purchasing cheaper seed in order to save a few cents, but it is our duty to correct this false economy. 6. Large quantities of seed grain are still imported from wholesale seed merchants of Ontario and purchased by farmers at figures higher than demanded by C. S. G. A. members. This seed is unacclimatized, may or may not be true to name, and generally is unselected. Present means of hastening distribution of selected seed are throughour energetic inspector, Mr. S. J. Moore, the limited circulation of the C. S. G. A. annual price list, and the Nova Scotia Agricultural College. This may be adequate to the distribution of 60 per cent. or more of registered seed, yet it is inadequate as an inspiration for a greater production or rapid education of the consumer. How we may increase the demand for such, I would suggest for your consideration and discussion the following means:

Through the Fall Fairs we, as an Association, might interest farmers by offering special prizes for registered seed or product from it. Special notices and placards regarding registered seed would draw attention to the same. During the year 1911, eleven county Fairs were held in Nova Scotia, where attendance surpassed all previous records. It is true that these were held at a too early date for the threshing of total grain crops, but a seed grower should make it his business to exhibit more freely at these, and the few cents for posters about this exhibit would be well repaid. However, the majority of our Fall Fairs have no Association members amongst exhibitors. A proposition which I think would be well worth entertaining would be that of a travelling exhibit of C. S. G. A. seed to attend County Fairs in each Province.

This exhibit should contain oats, barley, wheat, peas, turnip seed and if possible, potatoes and corn. Not only should there be one or more varieties, of elite stock seed in each class; but the same varieties unselected, and with one and two years selection to showcontrast. The influence of selection toward increasing yield and uniformity of seed could be shown relatively in glass tubing, labelled to donate variety, increasing yield, varying percent hull, weight per bushel and the like. Sheaves accompanying the same to further exhibit yield of straw and character of the straw would add greatly to its educational value. Aside from exhibits, photos taken in the field, showing difference in height of straw and character of same uniformity of stand, etc. of selected vs. unselected grain would be of great value. This properly exhibited and advertised with large signs, would draw attention and at the same time would act as a uniform standing for the seed judges. Using Nova Scotia as an example, the cost of such an exhibit for one season could be roughly figured at $200. Two bushel samples each of elite stock, general crop, and unselected seed, donated by each of the C. S. G. A. members, would be a good investment in advertising. It might be necessary to make two exhibits for Nova Scotia, as Fall Fair dates for east and west conflict. I have figured in the above costs one month's wages for two men, cost of printing, canvas bags, packing cases and glass tubing, which could be used from year to year, together with freight rates.

Such an exhibit might well be used at our Winter Fair, and would add largely to interest in agronomy. I would also propose another means of advancement in winter auction sales of registered seed in conjunction with a few of our larger Seed Fairs. As has already been pointed out, these at present to the growers are unnecessary, yet there is no surer way of gathering a crowd or creating and maintaining their interest as at an auction. Such sales, have, I believe, had a marked success in Quebec and Western Provinces, where some Maritime provincial seed met special favor and we might well copy this scheme. There is, of course, the objection that either the association or the growers risk a loss should bidding be low, but with the proper advertisement this should be worth a trial.

Local seedsmen might co-operate in advertising registered seed were its advantages fully detailed and a reasonable commission granted.

Growers having a surplus have resource to local papers and agricultural journals. It is, of course, a fact that a good article speaks for itself. Nevertheless, local prejudice against any forward movement usually has a great retarding influence. Any possible means of interesting neighbors during the growing and ripening season by local agricultural picnics to visit their plots, would largely increase local demand.

The joint work of the C. S. G. A. and our local Governments in Standing Field Crops Competitions has and will continue to advertise registered seed. It is worthy of note that nearly 75 p. c. of the highest scores during the past two years were made either by registered seed or its progeny. This has with us, during the past two years, nearly doubled inquiry for such stock. Agricultural Societies might organize to a greater extent on the seed question and thus hasten distribution. Institute speakers, under the auspices of these societies, have done much to encourage seed improvement. It is, however, a noticeable fact that for such workers we have but little accurate data to prove advanced yields through the use of selected seed and from such to prove financial gains accruing.

The Experimental Department of The Agricultural College, Truro, N. S., has endeavoured in various ways to acquire such data. One series of experiments was started three years ago to show the influence of acclimatization upon the ield of grain, per cent hull, weight per bushel, and straw, with the results to date that, under the same influence of selection, seed will produce superior crops when grown under accustomed soil and climatic conditions. Grains brought from unlike climates will increase in yield as they become acclimatized. The percent hull and date of maturing will also adapt themselves to locality. We hope to give definite results from the same in a few years and these results should help to destroy the old theories as to change of seed. Other experiments, such as Fanning Mill selections, rates of seeding and the like, will, we hope, have equally practical results.

All seed for plot work is selected according to C. S. G. A. methods. During the coming year we propose starting an experiment with elite stock seed, Banner variety, in comparison with No. 1. Banner seed, unregistered, to determine the influence of hand selection. Such work each year is widening in scope as our limited means permit. I am pleased to report an increased number of visitors to the Experimental Department and also correspondence regarding seed improvement. We endeavour to make the C. S. G. A., its members and their stock most prominent.—An address by Prof. E. S. Archibald, N. S. A. C., before the Maritime Section of the C. S. G. A. at Amherst.

The Selection of Seed Corn in the Maritime Provinces.

Fifteen years ago, I began growing corn and built a square silo. Three years later, I built a round one in addition. I was so well satisfied that I thought there was no better way of keeping up the fertility of the farm, for by growing that amount of corn I could keep one-third more stock which meant a great addition in fertilizing material.

I have heard people say that corn was an uncertain crop, but I have only once in that time failed in getting a good crop, and that year it was more than half a crop. I think one can count on corn as safely as on any other crop on the farm.

I think corn is the best crop for a dairyman to grow, for the dry and hot summer, when hay and other crops are apt to fail, is the banner year for corn.

The best way to prepare a field for corn is to take a sod field and give it about 20 tons of stable manure per acre in the winter, pasture it that summer, then the following spring when the grass gets nice and green, plough it down with a skimmer plough and follow with the harrow, also go over it at least once a week until time of planting, which will be about the first of June, in these provinces, or as soon as the ground becomes nice and warm for a seed bed. Then give it a good working up and roll down. Then mark it off with a marker so that the drills will be three feet apart, We then drop the kernels from four to six or seven inches apart, run a light harrow over the drills lengthwise and roll down. In ten or fifteen days it will be up two or three inches, and if the young plants are less than a foot apart in the rows, I would run a light harrow across the drills which will hasten the growth of the corn, and kill a great amount of weeds. As soon as the plants can be seen nicely in rows, a cultivator should be run through it, at least once a week until the corn is three or four feet high. It should also be hand-hoed in the drills until it is a foot high, then it will take care of itself.

Although I had good success in growing corn, I began to think that some improvement could be made towards getting an earlier variety. For some years we did not get as large percentage of ears in the best condition for ensilage as I would like to have. I have found no better variety to grow in our province than the Longfellow. In 1906 I began to select the earliest ears for seed. I could only get a few ears ripe enough to grow that year. I had to cut the stalks before frost and stand them up to ripen. That plan I had to follow for three years. After that I could pick the best ears from the stalks ripe enough to grow, and this year, although we had a heavy frost on the night of the 14th September, three-fourths of the ears were in good condition for seed. I may say that I had a small part of my crop sown with imported seed of the same variety sown at the same time with the same care right alongside of my own selected seed, and you could not get a single ear in a drill fit for the table.

Professors Newman and Moore were at my place about the 15th August and they both pronounced the crop from my own selected seed at least three weeks earlier than the crop from imported seed of the same variety. Now I will show you what my corn ripened like this year.

I think the best method for our farmers of the Eastern Provinces to follow is to select their own seed in this way, and thereby grow a better quality of corn for ensilage than can otherwise be grown.

An address by Frank Gordon Morgate, P. E. I., before the Maritime section of the Canadian Seed Growers' Association at Amherst.

Some Common Defects in Crop Raising Methods in the Maritime Provinces.

The subject on which I am requested to read a short paper is a very broad one but, for present purposes, we confine ourselves to one or two of the most common and most easily remedied of the common defects in crop raising methods in our district. Chief among these we will mention the use of inferior and low grade seed. In the case of Field Root and Garden Vegetable seeds the improvement is, to a certain extent, beyond our control, as very little, if any of it is grown in this country. About the only recourse we have at present, is buying from our most reliable seedsman their best grades of seeds at a comparatively high price. Fortunately these seeds are usually the cheapest in the end. In the past few years a few of our farmers have made a success of growing different varieties of turnip seed from selected plants and have been able to sell the product at satisfactory prices. It is quite possible more of our farmers could produce this and other Field Root seed at a proft.

In the case of our cereal crops, especially the principal one, the oat crop, we have the remedy in our own hands. It would surprise the few of our farmers, who for years have been doing their best along this line to learn of the large precentage who annually go either to the feed grain bin just as it come from the threshing mill, or to the local dealer when seed time comes around for their seed grain. The latter practice is perhaps to be most condemned. In addition to procuring grain that was not previously grown for seed, he is liable to get stuff that, at the best, would not grade higher than No. 2 considerably mixed with foreign grains, quantities of noxious weed seeds with which our farms are not now polluted and we hope never may be, beside very often not being true to variety name. When we consider that the essentials of good first-class seed grain are purity of variety named, freedom from foreign grains and seeds of noxious weeds, and full maturity, we are apt to ask where it can be obtained? The answer is on our own farms, or on the farms of some of our near neighbors. It is not difficult at the present time, for almost any farmer to obtain in the Maritime Provinces, a few bushels of our most popular varieties of oats pure; and by the next year he will have with proper care, all the good pure seed he requires. Untortunately owing to the too common practice of sowing two or more distinct varieties on one farm it is very difficult to maintain this grain in its pure state. and in a few years the farmer is looking for new seed. This might be all right if a sufficient number were engaged in the production of pure seed, but at the present time the supply is inadequate as only a few of our farmers are making a business of producing seed for sale. Any farmer who has a well cultivated farm adapted to the growing of a certain kind of grain can produce better seed for his locality than can be purchased anywhere. But he must have a special seed plot. The farmer who takes his seed grain, grown indiscriminately on his farm will not be more successful than the breeder of pure bred live stock who uses as the sires and dams of his future herd the animal which comes first to hand or was most convenient regardless of form, fit or quality. If the breeder of live stock finds it profitable to spend thousands of dollars in order to obtain the best results from his herd, will we not find it much more

(Continued on Page 238.)

HORTICULTURE.

Experiments in the Pollination and Setting of Fruit.

The following is a brief summary of experiments which I have conducted during the present year on the pollination and setting of fruit. To test the effect of excluding bees from strawberry blossoms, the box portion of a handlight was placed around a plant and muslin tied over the top; on other plants, single bunches of unopened flowers of several different varieties were placed in muslin bags, but in each case very little difference between the fruit of the enclosed flowers and those in the open was to be noticed; apparently the wind carries the pollen over the flower, as the ordinary strawberries in cultivation set their fruit with pollen of the same flower.

In raspberries and loganberries, enclosed in muslin bags, the fruit set, but they were not quite as large or as perfectly formed as in the open.

In gooseberries and red and white currants, of which unopened blossoms were enclosed in muslin and paper bags, but few fruits set, and those apparently only were rubbed by the bags. In those bagged and hand-pollinated, the fruits of gooseberries set fairly well, but as the blossoms open gradually, the flowers should have been pollinated several times. In red currants, bagged and hand-pollinated, the fruits set quite as plentifully as in the open, and some of the berries were notably larger than the average.

The above mentioned fruits are self-fertile, and though all are benefited by the visits of bees, with gooseberries and red and black currants bees are absolutely necessary for the production of fruit.

The fruit trees, namely apples, pears, plums and cherries, may be divided into those varieties that are self-sterile, i.e., those that will set and mature their fruits when pollinated with pollen of the same variety and those that will not.

In pears, no fruits matured on fifteen varieties which were bagged but not pollinated; with those bagged and pollinated with their own pollen, Durondeau Berre Diel, General Todleben, Dr. Jules Guyot, Josephene de Malines, and Marie Louis set fruits, but they gradually fell, last of all General Todleben; the only two varieties which matured their fruit were Duchesse d'Angouleme and Colmar d'Ete.

Of pears cross-pollinated, I have good results with Vicar of Winkfield with Winter Crasanne pollen, Williams' Bon Chretien with Duchess d'Angouleme, Conference with General Todleben and vice versa.

In plums, trials were made with Victoria, Czar, Rivers' Early Prolific, Cox's Emperor, July Greengage, Greengage, Pond's Seedling, Bittern, Jefferson, Dennison's Superb, and Early Orleans; of those bagged and left untouched, only Victoria and Czar set and matured their fruit; of those bagged and pollinated with their own pollen, only Victoria, Czar, Dennison's Superb, Bittern, and Rivers' Early Prolific matured their fruit. These varieties would therefore seem to be self-fertile, but most of them appear to set fruit more plentifully and bear larger fruits when pollinated with pollen of another variety. I ought here to add that Mr. W. O. Backhouse, who has made trials with Rivers' Early Prolific on a large scale, finds it is the exception for this variety to set fruit when fertilised with its own pollen.

Of flowers that were cross-pollinated, I had good plums on Pond's Seedling with Czar Pollen, Rivers' Early Prolific with Victoria pollen, Victoria with Czar pollen, Dennison's superb with Rivers' Early Prolific pollen; the pollinations were made without emasculation.

With cherries, out of some nine different varieties no variety set fruit when bagged and left untouched; when bagged and pollinated with their own pollen, only one variety, Florence, besides Morello, set fruit, and it only bore one or two fruits; Morello set nearly as well as in the open when pollinated with its own pollen.

In the cross-pollinated cherries, fruit set in each case, showing the necessity of visits of bees and the advisability of mixing different varieties of cherries in a plantation.

Out of 63 varieties of apples tried, on which unopened blossoms were bagged and left untouched, only Irish peach matured its fruit, and that was very good; of those bagged and pollinated with their own pollen by brush or anthers, the following matured their fruit: Irish Peach, White Transparent, Newton Wonder, Ecklinville Seedling, Summer Golden Pippin, Baumann's Red Winter Reinette, Peasgood's Nonesuch, Christmas Pearmain, King of the Pippins (damaged by sawfly, eventually fell), and, I believe, American Mother and James Grieve, but am not certain of the two latter. Whereas in nearly all the crosses made good fruits have resulted, out of 64 crosses some 48 were successful; among the best may be mentioned: Brabant Bellefleur with Beauty of Bath pollen; Mr. Gladstone with Beauty of Bath, Alfriston with Beauty of Bath, Christmas Pearmain with Cox's Pomona, Mere de Menage with Sandringham and Hormead Pearmain, Allington Pippin with Summer Golden Pippin, Beauty of Bato, with Summer Golden Pippin, High Cannons with Grenadier, The Queen with Baumann's Red Winter Reinette, Lane's Prince Albert with The Queen, Cellini with Grahams' Royal Jubilee. These crosses were made without taking out the stamens from the flowers, pollination being effected by brush or anthers; if the brush was used, it was dipped in methylated spirits and allowed to dry before using again; but in the case of a tree of Cox's Orange Pippin, nine branches of unopened blossoms had their stamens taken out with forceps and were pollinated by comel's hair brush or anthers with the pollen of nine different varieties of apple, to try to see which would give the best result; eight of these set fruit, namely, with High Cannons, Bramley's Seedling, Grenadier, Lady Henniker, Golden Spire, Duchess's Favorite, The Queen, and with its own pollen. In these trials only with Peasgood's Nonesuch did fruit not set. However, they have gradually fallen till the only ones left are those pollinated with High Cannons and Bramley's Seedling, the latter being one of the best fruits on the tree. It would be of interest and probably of value to find out a good polliniser to plant among Cox Orange Pippin, which is a self-sterile variety, i. e., flowers self-pollinated will not mature fruit. One grower informed me that he found Worcester Pearmain a good variety to plant among Cox's Orange Pippin, and Mr. C. Martin, Manager of the Toddington Orchard Co., in Gloucestershire, told me his best fruits of Cox's Orange Pippin came from a plantation interplanted with Duchess's Favorite.

We want more light on this subject in England. Messrs F. J. Chittenden, W. O. Backhouse, Little and Avery have added valuable information but we still need much investigation and observation of fruit-growers and economic botanists before we reach the knowledge already gained by American and Australian horticulturists as to which varieties to plant together.—Cecil H. Hooper, in The Fruit Magazine.

High vs Low Heading.

The advocates of the low-heading system base their claims of superiority on the following grounds: A low-headed tree can be more easily sprayed, and the fruit can be more easily gathered from it. There is no question that both these claims are well founded, and the low-headed tree has the advantage in both of these respects. That they can be more easily pruned is also true but is offset by the fact that as the tree increases in size it will require much more pruning. A low-headed tree presents a more attractive appearance. This is purely a matter of personal preference and cannot be discussed. It may be brought into bearing in a less number of years. This is admitted. It will produce more fruit. This is questioned and is worthy of an extended discussion.

A low-headed tree certainly will produce more fruit during the first few years, perhaps twenty or twenty-five, but as it increases in size, either the lower limbs will drag upon the ground and become unproductive, or by pruning the trees will have developed into the vase form. In either case the head will be much smaller. There will be much less apple producing surface, and in consequence a low-headed tree must eventually yield in point of production. This is thought to be offset by the fact that low-headed trees may be grown much closer together and thus increase the yield per acre. And the foremost horticulturist of the world has lately planted an orchard which shall consist of several thousand trees planted but 16 feet apart each way and headed to within one foot of the ground.

The opponents of this system admit that while during its infancy a low-headed, close-planted orchard may yield a greater profit per acre, yet as the trees increase in size this close planting will so seriously interfere with the health, vigor and vitality of the trees and the development of the fruit that eventually such trees will fall far behind in productiveness and profit. They believe that when the broad spreading dome of a well shaped, high-headed tree attains such a size that it occupies all the space allotted to it, that tree will produce all the fruit that the soil can yield, and no tree can produce more. They believe that a high-headed orchard can be cultivated and fertilized more easily than a low-headed one. And this is true, no matter what system of cultivation may be practiced. They believe that when a high-headed orchard is pastured, or when live stock breaks into the enclosure, less damage will result from the browsing of the limbs and twigs. This is granted. They also make the assertion that forcing the trees into early bearing causes premature decay and death. This is vehemently denied, and here the matter rests.—Country Gentleman.

THIS BOOK READ IN JANUARY, MEANS PROFITS IN SEPTEMBER.

Vanco Spray Chemicals and Fertilizers.

Vanco Lead Arsenate will destroy all leaf-eating insects—never burns—sticks longer. The largest order ever placed for Spray Chemicals by any Canadian Fruit Growing Co., was for "Vanco" Lead Arsenate.

Vanco Lime Sulphur Solution is strong, uniform, clear, efficient — the strongest perfect solution that can be made. Government Bulletin proves this. Specific Gravity on every barrel, to protect you.

Fertilizers Muriate of Potash — Sulphate of Potash — Acid Phosphate — Nitrate of Soda. We are the only house in Canada selling only straight chemical fertilizers —analysis guaranteed.

BUY WHERE YOU CAN BUY EVERYTHING AND SAVE FREIGHT.

SEND FOR THE "VANCO" BOOK NOW—study it at your leisure, and spray for future profits.

The Apple Industry of N. S.

The valley between the North and South Mountains is one of the most beautiful and fertile districts in the province of Nova Scotia. It is divided into an easterly slope, drained by the Cornwallis River, and a westerly, drained by the Annapolis River. Here in this valley lies the chief apple producing district of Nova Scotia. Even back as far as 1606, when Lescarbot tilled the soil this land has been noted for its fertility.

It is difficult to say just when apples were first grown in this valley but we know from history that apples were grown in the French gardens at the time the Acadians were deported from that locality in 17—. Thus we find the English settlers coming in a few years later and finding orchards already on their lands, and even to-day we have varieties which have descended from the old French stock.

Grafting was started in Kings County by Colonel John Burbridge in 1764. He imported scions from England, and thus we have obtained some of our standard varieties; as the Nonpariel and Golden Russet. His example was followed by other men, until to-day we have about eight hundred varieties to make a choice from.

A few years ago few men felt competent to undertake to care for more than ten to fifteen acres of orchard, but to-day with their up-to-date machinery and better knowledge of how to care for an orchard we find orchards of one hundred to one hundred and fifty acres which are better cared for than the ten acre orchards of years ago, and yet interest in the fruit-raising industry is just awakening. This with our preferential trade with our Mother Country, and better means of transportation which we are sure to obtain will give our industry a future that was little dreamed of.

The crop of 1911 has surpassed all estimates, and has proved the banner year in the history of the province. We have given that if the increase from 1910-15 was in the same ratio as years before that the export of these years would be an average of 723,447 barrels. This is the export alone. It is estimated that 150,000 barrels are consumed locally every year. The estimate for the crop of 1911 is 1,000,000 barrels; and over 600,000 of these have gone forward already. Thus we see that the export for 1911 will greatly exceed the above estimate.

The quality of the fruit this year was unexcelled. Not a trace of our common enemy—the black spot—could be found, and the other defects were very slight. This is largely due to the incessant work of the farmers with their spraying outfits and their new spraying solution, i. e. Lime Sulphur. The favorable climatic conditions that prevailed while the fruit was developing also had a great deal to do with the high class quality of our fruit.

As the season drew near, the great labor problem again confronted the farmers, but the farmers, ever ready for an emergency, combined, held meetings and appointed representatives who went into the adjoining counties of Digby, Lunenburg, Colchester and Cumberland and secured help; thus this problem was worked.

But a little later a still greater problem confronted our farmers, and one that looked almost impregnable. This was the barrel problem. As the season advanced, and altho barrels were imported from other counties and even from Ontario, barrels became still more scarce. Prices jumped from 25 to 30 cents, from 30 to 35, and from 35 to 40 and higher and still could not be obtained at that fabulous figure. As the crop matured two weeks earlier this season people could not wait for barrels, therefore they were compelled to pick the fruit and put it under cover without barrels and then wait until barrels could be obtained.

All the windfalls, culls, etc., were hurried away to the evaporators as fast as possible, but these factories, altho they had their full force working, were soon overburdened and had to stop taking apples. Thus hundreds of barrels that should have been manufactured were wasted. This shows us that a few more evaporators in the Valley would prove a good investment.

A few years ago people thought that with Ontario and the United States both producing large quantities of fruit that there would be no market for ours; but with the opening up of our Canadian West our farmers will not have to compete with these countries but will have the English market more to themselves than ever before, and in spite of our increased production there are possibilities of an apple famine in the future.—Maritime Student's Agriculturist.

No Flour Made From One Wheat Only Is Good For BOTH Pastry And Bread.

Western Wheat makes a strong bread flour which, however, lacks flavor.

Ontario wheat makes the best full flavored pastry Flour. This is because of the peculiarities of the wheat itself. Ontario wheat is rich in nutriment and flavor but lacks strength or strong baking qualities. Western Wheat has the strength without the flavor or pastry making qualities.

"Beaver" Flour is a scientific blend of both, giving you all the flavor and nutriment and pastry making qualities of Ontario wheat with the added strength of the Western Spring Wheat.

"Beaver" Flour makes Cakes and Pastry with the lightness and delicacy of flavor of the choicest "Ontario Pastry Flour", and bread that is truly home-made in flavor with the large loaf derived from the strength of the Western Spring Wheat. It is the one flour that is equally good for bread and pastry—*and best for both.*

"Beaver" Flour is the original blended flour—the first and foremost in quality, strength and reliability. Be sure to specify "Beaver" Flour whenever you order.

Dealers—write us for prices on Feed, Coarse Grains and Cereals.

Disposing of Surplus Crops.

A campaign of education is demanded to make certain the benefits of organized efforts in disposal of farm products. The farmer is both buyer and seller, and to touch directly the base of supplies and lowest cost prices necessitates the same organized movement as in selling. I care not how complex the problems facing the worker; if he but thinks as he works, the solution is certain. You may curb oppression in big corporations, but you cannot legislate them out of business. A fruit grower's association in Maine composed of but nine members has, by placing its fruit in the hands of one of its number, this year realized from 75 cents to $1.25 more per barrel net than was paid in the open market.

Justice will never be approached until in every village, town and city, public market places are established at convenient centers where the grower may display his goods and meet the consumer face to face. The immediate effect would be:

1. To insure the grower a better price.

2. To insure a closer grade and pack, and choicer quality.

3. To educate consumers to the superior value of fresh grown farm products, and right selection of same.

4. To bring consumer and producer face to face and establish friendly relations.

5. To increase consumption of the healthiest food known.

6. To inspire determination to improve in quality and increase in quantity the crops sold.

7. To lead to a specialization in production best adapted to the farm and local demand.

FERRY'S SEEDS

Good gardeners are those who raise good flowers and vegetables. Good flowers and vegetables come from good seeds. We produce good seeds—the inference is obvious. For sale everywhere.

DAIRYING.

To Insure Clean Milk.

There are many reasons why milk is not always first-class when it is delivered at the creamery and cheese factory. One reason is, that the cans, strainers and hand separtorsa are not properly cleaned and cared for on the farm.

There are many different methods employed by different people in caring for their dairy utensils; some of these methods are good, while others can not be too strongly condemned.

Some people have a habit of washing their cans, separators and other tinware with a dishrag. This is a very poor method, and no tinware can be properly cleaned in that manner. When cleaning dairy utensils it is best to make use of a good brush, as a brush will reach the crevices and the corners where the bacteria lurk, while a dishrag will not. The washing of dairy utensils is not a hard task, if the right methods are employed. Here are a few things that should be observed in order to get the best results:

First wash the pails, strainers, cans, and separators every time they are used, also wash them as soon as possible after they are used.

Never allow milk or cream to stand around or sour in any of the cans or other utensils used. If skim milk is returned in the cans from the creamery it is best to empty them as soon as they reach the farm, and they should immediately be rinsed with cold water; next, they should be thoroughly washed, using warm water with some good washing powder, and don't use that rag, but a good brush. After washing, the cans should again be rinsed to remove the soap, then a good scalding will finish the job.

But don't make the mistake of placing the cans upside down over a post and leaving them there all day, but simply let them drain for about one minute, and then place them in such a position that the sun can shine into them.

The method of washing cans will apply to other utensils used, including the hand separator, and don't forget to give them all a sun bath whenever the sun shines. There is nothing like sunlight for purifying and disinfecting everything used in the dairy. The writer has seen Danish buttermakers move their churns out on the sunny side of creamery, in order to give old Sol a chance at them. If all dairymen knew the value of sunlight, and would make good use of it, a better and purer milk and cream supply would be the result.

Debit and Credit With the Dairy Cow.

This is the title of a very practical as well as a most interesting address made by Roland T. Patten of Skowhegan, Maine at the Norway Dairy Conference. Mr. Patten's Dairy and his method of conducting it has attracted the attention of the good dairymen of the state. His address was, therefore, given most careful attention. In connection with the address he showed the records to which he referred and these were examined with a great deal of interest. Mr. Patten said:

I have three little girls at my home, aged 6, 8 and 13 years. They are all in my employ and receive very modest salaries for the performance of simple household tasks. The eldest is the bookkeeper, and I hold in my hand the record which she keeps. Each Saturday evening the little folks meet in my study. They bring this book and their purses with them. The entries are made for the week, the money is counted and each account is made to show what has been received, what has been paid out, and the balance on hand. This is bookkeeping in its simplest form, and many a New England housewife keeps a similar account of the family income and expenditure. Many farmers keep a similar record, and some carry it so far as to be able to tell what each particular piece of ground costs and the value of the yield. We dairymen, perhaps more than any other class of agriculturists, have come to keep careful records of our herds, so that we know for the most part what each cow consumes for food and what she yields us in milk and butter-fat.

What I have to say that is new to any of you will be chiefly in relation to items of cost and income pertaining to the dairy cow, that are not often taken care of. Among them are risk, depreciation, insurance, interest, taxes, upkeep of farmhouse, cost of stabling, bedding, keep of bull, grooming, stable work, care of product and ice; also as to income, manure and progeny. Every one of these items has its effect upon our problem. It does not matter that we own the house we live in and the stable in which we keep the cows; the business must provide a profit that will pay all the charges on them and renew them when they wear out. It does not matter if we do the work for the whole herd; the business must pay us at least 20 cents an hour for our time or we could do better at some other occupation. An accurate knowledge of these items may be had by very simple account and will, I am sure, pay any of us for the little trouble involved.

I am accustomed to consider risk and depreciation together. A cow is liable to die or become valueless as a dairy animal any time. In any event, her usefulness, on the average, will not extend beyond ten years. It is proper, then, to charge off 10 percent of her value every year under risk and depreciation.

Our cows, as well as the buildings they are in, are liable to destruction by fire. We can run this risk or pay some company for assuming it for us. In the latter case it will cost us about $2.50 per year on each $1000 of value. This fire risk, whether we assume it ourselves, or pay for it, is always present, and the cow must pay it. I usually put the taxes in the same column. This charge may be reckoned in most Maine towns at 2 percent per year on the assessed value. When you compute insurance or risk it should be upon what you could sell the cow for; when you compute taxes, it should be on what the assessor values her at.

Now as to the cow's share of the farmhouse. We don't give her shelter there, though some of our ancestors were doubtless so quartered, but it is plain that we could not keep the cow if we did not also provide a shelter for man who cares for her. There is no dodging it, the cow must share in what it costs to keep the farmhouse going. I do not refer to the food, fuel, furniture, etc.; these come in when we charge the cow for the labor of taking care of her. I mean the home, the house itself, the interest on it and what it costs to keep it in repair. Ten percent is a handy number to figure with and, in this instance, again it is just about the thing to charge to the farmhouse to keep it going. Suppose the house is worth $1500, 10 percent thereon would be $150 per year. We would charge mulley with all of this, as the house is just as necessary to the orchard, the cornfield and the potato crop as it is to the dairy. The proportion to be assigned to the cow will varry, but perhaps one-third of it would be a general average for an average farm.

The cow must pay for her stable, say 10 percent on $100, for each member of the herd. It will take about a ton of straw to bed her with for year, and she must pay for that. We have to keep a herd bull or pay our neighbor for doing so and that is a legimate charge to the cows. The cows should be groomed, taking about five minutes a day for each animal. The tie-up must be kept clean and in order, and the labor paid for, as well as the labor of milking, separating, caring for the separator, milk cans, etc. Ice must be provided for the care of the product, and its cost charged to the dairy account.

Now our cow under discussion has been patient while we have charged her with a lot of things, everyone of which creates expense, and some of which she very seldom hears mentioned, it's about time we took up the matter of income. The cow always gets credited with the milk and butter-fat, and sometimes with the value of her calf. There is one other valuable product, the manure. The calf is worth from one-half to one cent a day, if from a grade cow, and from five to 10 cents a day if from a registered cow by a registered sire. The manure is worth eight cents a day for a one thousand pound cow.

In every herd there will be also a slight charge for the service of a veterinarian and for medicines. I am inclined to think that I have made some of the other items broad enough to include whatever that would be, but that is not the way to handle it. It would be far better to know what the veterinary charge was, all by itself. I propose to so consider it when I have a data enough before me to make such consideration fairly accurate.

There is another matter that I have made note of which ought to come into the calculation. It is the gain or loss in weight. If we find that a cow is 100 pounds lighter at the end of a year than at the first, we should reckon a portion of the beef price of this 100 pounds as a loss. If we were to sell her for beef, we should get about $5 less for her. If we continue her in milk, we must so feed her as to stop the decline in weight and perhaps to put part or all of it back on her body. In either case she is worth less after the 100 pounds are gone. I wish someone would give me their opinion as to the handling of this item—gain or loss in weight. I have not made up my mind as yet just how it should be charged or credited.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Dairy Briefs.

Feed the cows a little light just before freshening to give best results.

Equal parts of crushed corn, ground oats and wheat makes an excellent butterfat ration, if supplemented with forage.

Wash all milk vessels in luke warm water then scald and air well.

Do not forget to salt the cows once a day to keep the milk odorless.

Give the churn and churning jars a sun bath after scalding them to make tasteless butter and delicious milk.

Never pour a quantity of warm milk in the churning unless soft butter is wanted.

Butter that tastes old may be freshened by rechurning in fresh buttermilk and adding a pinch of soda to the milk.

Cellars or dug-outs used for milk should be whitewashed frequently and all odorous vegetables, etc., kept out. The entrance should be supplied with a screen door to be used at night, and the wooden shutter left open.—Mrs. D. B. P.

Dolly Dimple's Calf Sold.

The Langwater Farms have bargained the coming calf of the great Guernsey cow Dolly Dimple if it should be a bull for $6000 to Mr. M. H. Tichenor of Oconomowoc, Wis. It is also reported that he had refused $4000 for his option. A record price surely and showing conclusively that it pays to breed good ones.

Preventing and Handling Diseases of the Dairy Cow.

Dr. J. A. Ness of Auburn gave a practical talk to the dairymen at the meeting in Norway on the subject of "The Prevention and Handling of the Common Diseases of the Dairy Cow." Dr. Ness, who is a veterinarian by profession, is also a practical and successful farmer and dairyman, and as he is now devoting himself to the farm and dairy business in a practical way for the purpose of profit, like any other farmer, his talk was greatly appreciated. Among other things, Dr. Ness said:

"Why is it when an epidemic breaks out in our own families, so many escape? It is because those who are not taken have in their systems the elements of perfect health that prevent from taking disease. In preventing diseases in the dairy cow, the first thing is to get her in perfect health. In too many dairy barns we find imperfect ventilation and light, too much filth, dust and dirt. The cow to be healthy has got to be kept in a clean place. We can't determine to what degree sunlight will prevent disease, but it will greatly help. I am talking about the common tie-up, such as I have myself. Every year the dairyman should give his tie-up a thorough cleaning. whitewash, lime, is a great sweetener and cleaner. You don't want to think that because some millionaire has a good King system of ventilation that you cannot have a well ventilated tie-up in the ordinary barn with a simple ventilating system.

"Don't overfeed your cows in any way. Starvation will bring a cow to her feed if she is off feed quicker than anything else.

"In treating a dairy cow, the main thing is a good dose of salts. For the first dose a cow of a thousand pounds ought to have two pounds. Epsom salts are safest.

"A farmer can well spend a little time in grooming. The skin of the cow is a most important excretory medium. If you have a good clean tie-up, you are not liable to get any diseases, but if you do get them, they are half treated in such a tie-up. If the cow is off her feed, don't keep putting feed in front of her. Take it away if she has any. Get in the habit of so looking after your cows every day that you will know as soon as there is anything the matter.

"In parturition there is more likelihood of trouble, for the cow is then in a tender condition. Use your common sense. In swellings of the udder, don't be too severe. In this season of the year, bathings of hot water are apt to have a bad after-effect. The best things we can give are iodide of potash and aconite. See that her bowels move off; clean her out well.

"For garget, iodide of potash, with vegetables for feed, is probably the best thing that can be done. Probably the greatest nuisance is cow pox. This is traded around by the milkers' hands. The best thing is a good disinfectant and cleanliness for both cows and milkers. The milkers should wash their hands after milking each cow.

"In milk fever the most important thing is to make the cow's bowels move. Give her some vegetable feeds. The heavier feeds should not be given at this time. The modern treatment is inflating the udder with sterilized air. The dairyman with thirty cows cannot afford to be without his own apparatus. A chill will bring on milk fever quicker than anything else.

"There are two kinds of milk fever. One of the first things you will notice is a little staggering in the gait. In the other case, there is first a little drowsiness. This is the more common. Apply the air before the cow is down.

"Tuberculosis is something that we buy and sell like the cows. You can reasonably keep clear of the disease with the tuberculin test. But with a properly ventilated and properly kept stable, you can keep down this disease as well as every other disease. Many doubt the efficacy of the tuberculin test, but I have used it enough to be certain that it is the best thing to use.

"I was called upon to test a herd of about fifty cows which showed absolute freedom from the disease. Later a cow from Massachusetts was brought into the herd, and in a little over a year eighteen were in bad condition and condemned. The Massachusetts cow was the worst one in the bunch. This shows the readiness with which the disease is spread.

"Abortion is the worst disease of all. The tie-up well kept and well ventilated is half the prevention. Disinfectant is most important. Abortion is the greatest source of loss we have. Carbolic acid is probably the best thing to feed the cow —a teaspoonful a few times. I have known a case of a cow where the disease was actually prevented by the use of carbolic acid in that way.

"Scours in calves as well as lice can be kept down by disinfectants and whitewash. Clean the calf pen frequently. It is well to whitewash several times a year.

"A good system of ventilation is the use of the muslin curtain over the window which is hinged at the bottom."—Maine Farmer.

Here is a remedy that will cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all Dealers.

LIVE STOCK.

Foot-Rot in Sheep.

With the exception of sheep scab, there is no disease to which sheep are subject which causes more annoyance and trouble than contagious foot-rot. Sheep frequently suffer in the foot from a form of rot, but it is the contagious character of the disease to which I propose to refer. It was shown by the late Professor Brown, quite contrary to general belief, that foot-rot cannot be produced in sheep by keeping them upon damp soils or fields which are undrained, or in which abundant wet herbage exists, nor upon damp, rotten litter or manure. Indeed, they may be kept in this way for months, assuming that they were healthy when they were introduced, without contracting the disease. If, on the other hand, they are introduced into a flock in which there are diseased sheep, they will contract it in from two to three weeks owing to its contagious character. Foot-rot, as is now understood by veterinarians, may be introduced into a flock of sheep possibly in one of three ways—by contact with the infected matter on the feet of diseased animals; by the consumption of infected herbage, the infection having been introduced by the presence of sheep suffering from the disease; or by actual inoculation. As sheep-owners or flock masters are not likely to inoculate the members of their flocks, the sources of infection are probably reduced to two. We may therefore assume that where healthy sheep are placed in a field to graze, if it has been occupied by an infected flock, they are liable to acquire the disease by contact with the organisms which are present on the grass, or possibly by the consumption of infected herbage.

INFECTION.

According to Professor Brown, the organisms responsible for the disease may remain in the system of a sheep from ten days or more without any indication being shown of the disease upon the feet, for which reason a sheep may be infected and present an apparently healthy appearance, and yet may, in consequence of having been infected, introduce the disease into a clean flock by contact with infected matter, or, on the assumption that infection is conveyed into the system of the sheep through the consumption of infected grass, by feeding on infected pastures. I am unable, however, to trace any instance within my own knowledge in which infection has been so conveyed. In any case, it is evident that a flock must be seriously diseased in order to communicate sufficient diseased matter to the grass to make it really dangerous. There is, in the first place, the probability that it will be washed into the soil by rain; and next, there is the still greater probability that the life of the organisms exposed on the grass will be destroyed by the sun.

Most experienced men will have noticed that sheep which are slightly affected with soreness on the feet when driven any distance on the road become worse. The few which were affected at the start are worse at the end of their journey, while others follow suit, the proportion of the flock which is affected being increased by travelling. If greater care were exercised in examining a flock from time to time, foot-rot would be destroyed in the bud. Where there is the slightest sign of scabbiness or soreness, or of that exudation of matter from the skin covering the arch of the space between the claws, the sheep should be at once isolated and the part affected dressed. Some flock-masters use glycerine at this stage, others chloride of zinc; others, again, prefer dilute carbolic acid—one part to thirty parts of water.

SYMPTOMS.

Foot-rot may usually be recognised by the lameness of a sheep, if it has not been recognised before. On examination of the foot it will be noticed that there is an abnormal condition of the skin between the claws, together with a discharge of offensive matter, in some cases the whole of the foot being affected and swollen. In all cases it becomes necessary to remove loose or jagged horn, not only to permit of the more complete discharge of the offensive matter to which we have referred, but that the diseased flesh may be cut away, as is necessary in extreme cases, and that the foot may be thoroughly dressed for the destruction of the organisms which are the source of the disease. Some flock-masters cauterize the foot in these cases with carbolic acid, but every effort should be made to avoid causing suffering. Some shepherds are far too ready with the knife, although it is evident that where the organisms are beneath the horn they cannot be reached unless it is pared away.

PREVENTION.

There is no doubt that if great care were taken to prevent attacks of foot-rot by occasionally passing the whole flock through a trough as slowly as possible that the foot may be covered with the material it contains for the destruction of the organisms, foot-rot would be much less frequent than it is. This material may be made of potash and arsenic—two pounds of each, mixed in one gallon of water, and boiled for half an hour; but it should not be allowed to boil over. After it has cooled six gallons of cold water may be added. It should be poured into a trough to a depth of about one and a half inches, sufficient indeed, to cover the claws. Great care must be exercised in the employment of this mixture, owing to its highly poisonous character, for which reason I should advise all concerned to hesitate before using it, and rather to depend upon their own observation, which should be systematic and frequent.

In all cases of foot-rot, however severe, the destruction of the organism which occasions it is followed by the healing of the foot. If this fact be borne in mind the sheep may escape great suffering and loss of condition, which is costly to the farmer, if there is a frequent examination. There are many cases recorded in which healthy sheep have been infected by infected sheep recently introduced among them, clearly showing that if care were taken to prevent the mixture of fresh purchases with the members of a clean flock, outbreaks of foot-rot would practically be avoided altogether. One of the most successful remedies for the treatment of diseased feet is chloride of antimony, which should be used after the horn has been removed and the discharge cleaned away, the dressing being kept close to the wound by binding the foot with tow. The lotion, which has frequently been employed with advantage, may be used for daily dressing. It consists of 2oz. of nitrous acid, in which 1oz. of red nitrate of mercury is dissolved. Two tablespoonfuls of water are then added to the solution, and it is ready for use, but these dressings are both of a poisonous nature, and should be kept under lock and key.

What Constitutes the Finished Bullock.

Before demand equalled the supply, the quality and kind of animal put upon the markets of the world was entirely in the grower's hands. The latter part of the nineteenth century heralded a revolution in this respect. Demand has grown so rapidly that it has equalled, and oftimes over-run the supply, and conditions are now vice versa. The buyers want a certain kind of carcass, and there is no choice but Hobson's for the beef man. He must meet the market requirements or quit the business. What does he want? He calls for meat and not appearance, and he wants that meat on the valuable places. He wants what the early animal and a good deal of our stock to-day did not and does not possess; less offal and more round and rib and loin meat. Does the consumer care how much it costs you to produce that cheaper meat? Not one iota. If your animal was nothing but a bone factory and it cost you as much to put the meat on the shank, plate and flank as it did to put the valuable meat on the ribs, that's your look-out. The consumer isn't Christian enough to pay for your mistakes.

WHAT THE MARKET CALLS FOR.

Fancy stock never yet made the live stock industry of any country. If you get the consumer's idea you will come to the conclusion that it doesn't matter one straw whether the finished beeve looks like a small elephant or an upholstered drawing-room suite, so long as he can deliver the goods that the market asks for. What the consumer wants is meat, and he will take nothing else.

A few years ago a large, heavy, thick, bullock, weighing about 2,000 lbs., suited all markets, but that kind of animal is a memory to-day. Why? Because the feeder couldn't afford to use his feed so wastefully. It took him almost twice as long to fit his animal for market. His feed was, in a great many cases, lessened in value by marketing it through the medium of the steer. The great, heavy, hulking brute looked good but possessed too much fat; the fleshing wasn't juicy enough, and because of his size, he was a problem to handle.

THE ANIMAL OF TO-DAY.

Cruickshank got wise and pulled the beef animal off his stilts, did away with his scrawny neck and heavy head, and produced for us the beautiful, economic feed consumer that is the most beautiful animal in the live stock world, and a tribute to the genius of the men who developed it.

To-day the animal that pulls top prices is a well finished, near the ground, compact bullock, not weighing more than 1,000 on his feet, and 1,200 lbs. is better, and at the latter weight he will command the highest price provided all other things are equal regarding form, flesh, quality, and finish.

IN FAVOR OF PRODUCER.

The producers profit by this change, because the younger the animal goes to the block, the less the length of the feeding period, and so the greater the profit to the feeder. British markets call for a beast of moderate weight, medium fat, and first-class quality. There must be sufficient fat on the carcass to insure that delicious flavor and tastiness which is the selling virtue of meats on the British market. The trouble with our Canadian beef growers is that they endeavor to grow the meat in a few weeks instead of utilizing a season's growing process. What is the consequence? Thick fat and a coarse, tough meat. Fat deposited on the outside of carcass and good for nothing but tallow. This is false economy in its worst degree, and beef growers will do well to get next to the economic method of beef fattening.

The real secret of producing first-class meat is to induce the fat to grow with the lean during the whole process of flesh production. This results in an even distribution of fat throughout the lean and the production of that splendid quality of meat which alone can demand a fancy price on our best markets. This carcass, when dressed out, should show specks of fat generously distributed throughout the lean. You can only secure such meat in one way, and that way is by consistent nutritious feeding and care from birth until maturity This shortens the fattening period and facilitates the putting on of the finishing flesh in good quality and quickly.

As mentioned before in a previous article on the steer, the requirements of both feeder and butcher must be studied and appreciated in the selection or breeding of the most profitable animal. The feeder calls for good bone, large capacity of barrel, and a chest deep and broad. On the other hand the butcher doesn't care two pins about these requisites in a feeding animal, because it is in these parts that the greatest waste occurs, and once the animal is dead and his digestive apparatus out of commission, these parts are of comparatively little value, although absolutely indispensable in life.

You will understand from this that you have the opportunity of the century to use your wits and good judgment. Strike a happy medium and stick to it! You are in the business for profit, and the ultimate criticism

Warranted to Give Satisfaction
Gombault's
Caustic Balsam
Has Imitators But No Competitors.
Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.
As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

THE MEN WHO ADVERTISE in the Maritime Farmer are experts in their business. It will pay you to consult them about your needs in their line. Tell them you are writing them because you saw their advertisement in the Maritime Farmer where all ads are guaranteed.

of your products can only be made after you consult your bank book. Your animal of 1,400 lbs. should dress out a carcass of 800 lbs., and the carcass is divided into the following parts at the affixed prices:—Loin, 144 lbs. at from 15 to 20 cents; ribs, 80 lbs., 18 cents; round and rump, 200 lbs., 12 to 16 cents; chuck and shoulder, 218 lbs., 12 cents; flank and suet, 48 lbs., 7 to 8 cents; plate and brisket, 80 lbs., 8 cents; shank, 30 lbs., 8 cents.

You understand now where the good meat is to be found and where you can lay your finger on the best prices. The article of a week or so ago dealt with the kind of animal to grow. We have endeavored in this article to show you where to put the meat and why to put it there. Where are you going to put it, on the table of the epicurean or in the soup of the people who can't afford to buy good meat? Canadian meats must stand against other meats on the British markets. In most things the Dominion takes no dust from any country. Shall our live stock industry be a credit or a discredit to our country? Ask the breeder and feeder.—Canadian Farm.

Breeding From Old vs Young Sows.

The vitality of our breeding swine has been surely undermined by the pernicious practice of using immature sows for breeding purposes.

Experiments and close observation in many different herds of swine have proven plainly that immature sows have much smaller litters of pigs than adult sows; that the pigs of the young sows are apt to be smaller and weaker than those of the older sows; that the young sows have a less quantity of milk for the pigs than is the case with the older ones, and that at each breeding period the younger sows tend to have a larger litter than the one previous until they have the average number of pigs usually brought forth at a farrowing of adult sows.

A great mistake made by a large number of breeders is in disposing of their young sows as soon as they have raised one or two litters of pigs. What reason they have for doing so I have never been able to learn. What sense there is in the practice is equally perplexing to discover. It is a poor plan and detrimental to the best interests of any herd of hogs.

The sow grows in size and capacity each year until she has reached maturity, and when that time has arrived she may have a large litter, such as was common in the old days when hogs were permitted to run out doors most of the time and lived a natural life.

In selling a young sow that has given birth to but few pigs in her first and second litters, there is no proof that such is going to be her persistent performance. She is just as likely to change and give birth to many pigs when she has gained full maturity, and the aptitude to do so is true of all sows.

In fact, there are many positive statistics to show that the litters of mature sows are not only larger than those of the average young sow, but they are better in point of strength and quality. Many a sow has made her reputation as a breeder after she has had two or three litters, and many of the great prize-winning hogs have come from old, rather than young breeding sows. It may be truly argued that the long-continued use of young sows has given us early maturity in our swine. That early maturity has been gained in this way seems certain, taking with the use of young sows that of young boars. But the early maturity has likewise come from changes in the environment of pigs and in the constant use of highly nourishing and forcing foods.

It should be borne in mind that the early maturity gained in this way has not been altogether advantageous to the hog. He has thereby been weakened in constitution, as everybody knows. He has been reduced in size also, and the market now takes and likes a small, neat hog, and pays an appreciative price for such, just because such hogs can now be had, and are quite common in fact, whereas in the old days the big hog was the rule and he was the product of slower development and age rather than of forcing methods. He came from the adult sow as well as the young one, for, as the young sows were in those days larger in size and more naturally handled, they had larger litters and stronger ones.

We cannot altogether return to the old methods of management, but we are foolish in the extreme if we sell off the brood sows just when they are coming to their prime and the continued following of a practice so absurd and detrimental as this must further undermine the vitality of our hogs. Give us less beauty of form as regards rotundity and lard plumpness, and more capacity of pig production and pig nourishing. Sows of the latter pattern will produce large, healthy litters up to at least six years old and I feel sure that the large litters with the added vitality and good health of the pigs will more than make up for any slight loss of quality as regards show points that may come from a return to more natural methods of hog breeding.—Dakota Farmer.

Sheep Industry Scapegoat.

Since time immemorial the sheep industry has been the scapegoat of all nations, and while they have been driven to remote places, they have not escaped being persecuted and assailed on every hand, and have seldom, if ever, been of a revengeful nature. The present situation is no exception to this well defined rule. While a great majority of the producers of sheep and wool work like Trojans, endure innumerable hardships, battle with drouths and blizzards and risk their lives, which are devoid of the pleasures, comforts and conveniences of the civilized world, they seem to lose all interest in their product after it is loaded onto the cars; they evidently do not care to know why their sheep and wool are selling at ruinous prices, while kindred commodities have increased in value.

The average consumption of wool per capita is less than six pounds, and if this was given free of charge the consumer would not be able to note the reduction. While the people are clamoring about the high cost of meats, mutton is selling 100 per cent cheaper than beef or pork. What is the cause of this ruinous depreciation?

It is needless for a few flockmasters to assemble and endeavor to devise ways and means for the protection and welfare of the industry but the hundreds who are engaged in the business and the thousands who depend upon it for support should not only attend our conventions, but should affiliate with us and assist us in obtaining justice.—J. A. Delfelder.

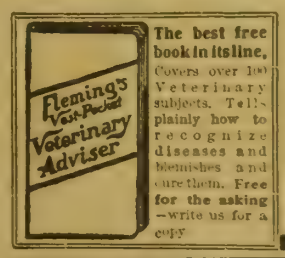
Do you salt your stock the same in winter as in summer? Not one farmer in five hundred does; and yet the cattle and horses relish it and need it just as much in winter as at any other season of the whole year.

Is Your Horse Lame?

Fleming's Spavin Cure (Liquid) cures the lameness and removes such blemishes as are soft to the touch—Bog Spavin, Curb, Thoroughpin, Capped Hock, Collar and Shoe Boils, and recent cases of Splint and Bone Spavin.

Fleming's Spavin and Ringbone Paste cures Bone or "Jack" Spavin, Ringbone and Sidebone.

These remedies do not **always** cure—but we'll refund your money every time they fail. Try them on the worst cases you can find—we'll stand behind them, as we stand behind all Fleming's Remedies.



The best free book in its line. Covers over 100 Veterinary subjects. Tells plainly how to recognize diseases and blemishes and cure them. Free for the asking—write us for a copy

Fleming's Tonic Heave Remedy—a remarkable tonic, which cures Heaves because it puts the system right.

THE HORSE.

Training the Colt.

In training a colt to drive I have found the most successful method to be, to accustom him to the harness and the bit before hitching him up. I harness him in the barn, check his head up, not too high, and fasten hitch straps to his bit, running them back to the backband on either side. I am careful not to make these straps too tight. Leave him room enough to move his head easily from one side to another, but make them tight enough so he will feel the bit. Then I turn him into the horse lot for two or three hours and let him become accustomed to the harness and bit. I give him this experience three or four times. Then I add a couple of check reins, one on each side, and drive him around the horse lot, stopping him occasionally until he is trained to the lines and will drive freely where I want him to. Then I hitch him up with an old horse and drive them both for two or three hours before hitching to the wagon. In this way the colt becomes accustomed to the harness and learns that nothing is going to hurt him. If care is used in this preliminary training there will be no trouble at all when hitched to the wagon. I have trained a great many colts in the last seventy-five years and have never yet had one refuse to go, or give me any serious trouble. —S. B. S. in Wallace's Farmer.

Winter Care of Pregnant Mares.

Those who have had experience and observation in horse-breeding have noticed that a considerable percentage of the spring colts, especially those born before the mares have had a greater or less time on pasture, are weakly, often not able to stand, and sometimes without sufficient life and ambition to nurse when held up and teat introduced into the mouth. It will also be observed that colts of this description are usually those of dams that have been pampered during the winter months—those that have been well fed, and kept in the stable most of the time without exercise. Of course, there are exceptions, and it is not uncommon for a mare so used to produce a strong foal. Therefore, while in all cases it is not necessary that breeding mares should have regular exercise during pregnancy it is at least advisable, and has a tendency to have a beneficial action upon the progeny. In countries where the climate is such that horses can run out in the fields with comfort, at least during the daytime, mares will take sufficient voluntary exercise; but often conditions, for weeks at a time, are such that they cannot run in the fields at all, and if turned out in the barnyard (which, of course, is better than standing in the stable), they will take little exercise, but stand in the most shaded place most of the time to keep as well as possible out of the cold until they are again allowed to go into the stable. The pregnant mare should be well fed aod given regular exercise or light work.

The idea that a pregnant mare should not be well fed is not uncommon. A little consideration will teach us differently. The foetus is daily gaining in size. This growth does not take place without nutriment. The nutriment must be supplied by the blood of the dam, and as nutriment is not a natural product of the blood, it is supplied by the food the animal eats, and we can readily see that the pregnant mare has not only her own tissues to nourish, but also those of the growing foetus, which, in the latter months of gestation, is no small matter. Hence, we see that the pregnant mare requires more food than her sister of the same size who is doing the same work. While she requires more food, greater care should be exercised in the selection of food of first-class quality, and it should be of an easily-digested character and fed at regular intervals. All possible care to avoid digestive derangement should be observed. Good hay and oats are the foods to be relied on to produce nourishment, and these should be fed in quantities proportionate to the size of the animal. In addition, she should be given a few raw roots daily, and a feed of bran, with a cupful of linseed meal, at least twice weekly. She should also be given all the good water she will take at least three times daily; still better if it can be arranged so that she can have water at any time. She should have exercise every day. If there be regular light work at which she is kept busy a few hours every day, it is better, but if not, she should be driven a few miles daily. The work or exercise should be light. Work that requires excessive muscular or respiratory effort should be avoided; so also should plunging through deep snow, etc., be avoided if possible. Excessive muscular exercise, plunging, etc., cause violent contractions of abdominal and other muscles which tend to produce abortion. Greater care than usual should be taken to not subject the mare to even moderate exercise shortly after a meal. Saddle work, especially in the latter months of pregnancy, should be avoided, as the mare has sufficient to carry without a man on her back; but where saddle work is given the use of spurs should not be permitted, as pricking an animal in the sides or flanks with spurs causes more or less violent contraction ol the abdominal muscles, which is unfavorable. All nervous excitement should be avoided, as also should sights which frighten her; also offensive odors. The odor of blood tends to produce abortion, hence she should not be allowed near a slaughter-house, etc., unless she be well accustomed to such. All operations, should if possible, be avoided, and so should the administration of medicines which tend to abortion, as drastic purgatives. When necessary to give a purgative to a pregnant mare, it is well to give raw linseed oil in preference to aloes, as, while it does not act so promptly, its action is milder, and does not cause the griping and contraction of both voluntary and involuntary muscles. Towards the end of pregnancy still greater care should be taken, and, while exercise up to the very last is advisable, it should be given more carefully and less of it when she becomes somewhat clumsy and inactive on account of size and weight but many of the most successful cases we have known have been when the mare has been unhitched from the plow or buggy when showing labor pains. We, of course, consider that after the birth of the foal the mare should not be worked for at least two weeks, and if we can allow her to run idle until weaning time, all the better. Many farmers who are breeding one or two mares have sufficient horses to do the work and driving without using the pregnant mares, and, as a consequence, they live in perfect idleness. We repeat that this is a mistake, and that while all horses are the better of a certain amount of exercise, it is better to allow the geldings and nonpregnant mares to live in idleness than the breeding mares.—Whip.

Horsemen Attention!

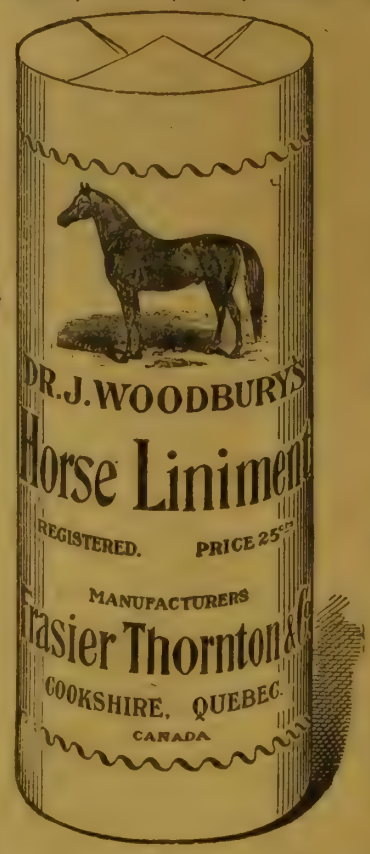
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

DR. J. Woodbury's Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

FREE-FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for **Bickmore's Farm Account Book.** It will be sent free to any farmer who will be good enough to tell who and where he is. The cost of a crop never demanded closer attention. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical, than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. **64 pages; for ink or pencil.** Not a cheap affair. It is meant for business. Its quality is in keeping with

BICKMORE'S GALL CURE

a remedy that **cures,** and the horse works all the time. Users keep it in their stables the year round—they believe in it. It is always ready for Harness or Saddle Galls, Chafe, Rope Burns, Cuts, Scratches, Grease Heel, etc. In cows use it for Sore Teats. Don't buy a substitute. Insist on getting Bickmore's Gall Cure—for the sake of your horse's health. But write now for Bickmore's Farm Account Book—it is ready for **you.** No cost. No obligation. Send your name and address—that's all.

POULTRY.

The Best Time To Treat Poultry Diseases.

Of course none will deny that once disease of any kind has appeared among a flock of poultry, drastic measures should be adopted and treatment begun at once, but going back of this the only way to make a flock of birds profitable is by preventing important diseases; and prevention is, therefore, the only sure and adequate remedy for diseased conditions, for once disease obtains a foothold, the usefulness of the flock is either over or at least seriously hampered. But properly bred, housed and fed poultry are little subject to disease. In the first place, the parent stock must be strong and healthy, not impaired in either health, vigor and mental capacity by continued inbreeding, so that there will be no inherited disease or lack of vitality in the foundation stock. Then, this condition existing at the start, great care should be used that it is maintained. If a hen is injured in any way, or suffers from any disease, even a cold, or even shows disease symptoms, her eggs should never be used for hatching purposes, no matter how fully she has recovered, or how strong she may apparently be. To do, is taking chances which are more than likely to prove detrimental to the young stock. This having been guarded against by the selection of the strongest and best hens, equal care should be taken in the selection of equally strong and healthy males, for whatever the size of the breeding pen, the male is half the pen and his characteristics will develop fully as strongly in the chicks as will those of the mothers. Great care should be exercised that none of the females are closely related to the male, and that all birds are well colored and properly shaped for their breed. It is not best to mate too many females to one male, and though one male will often fertilize the eggs of 20 or even 25 females, the best results will be obtained if not more than seven or eight females are mated with one cockerel of strong vigor. It is best not to mate cocks with hens, but a vigorous cock mated to a small pen of vigorous pullets, though results are surer where the mating is the other way.

Hereditary diseases having been provided for, white diarrhoea, the most fatal of all diseases to which young chicks are likely to be subjected, may be prevented, at least in a very large degree, by dipping the eggs in 90 per cent pure alcohol before setting, and thoroughly disinfecting everything with which either eggs or chickens are to come in contact, and keeping everything clean and sweet. Chilling and overfeeding also cause this disease, but these are things that can easily be avoided with proper care and attention, though they are easily brought on by neglect, even for a very short time. As the chickens develop, they must have plenty of fresh air and fresh water, but draughts and dampness under foot must be avoided, and these are both very dangerous disease breeders. Chickens can stand a good deal of cold if there are no strong draughts, but when chilled by cold air directly upon them, they are seldom of much value afterwards if they recover, as they sometimes do. In any event, they will make very poor breeders, though they sometimes do make fairly good layers.

Birds of any kind, when living in their natural environment, are very little subject to disease of any kind, and the unnatural surroundings and the foul air they are often obliged to breathe through over crowding are responsible for the major portion of the illness of poultry. They must have plenty of fresh air, but must be protected from cold winds, and must also be kept free from parasites, or they cannot keep free from disease. Give them a good dust bath where they can bathe in the sunlight and they will do much to keep themselves in good health, but they cannot do it in a house infested with lice and mites, and no poultryman should expect it, and healthful and clean quarters must be provided or the poultry business cannot be made profitable.

There are some diseases that can be cured, but the infected birds should at once be isolated or they will contaminate the entire flock, and the expenditure of much time or expense on sick birds is unprofitable, and the axe is usually the best and cheapest remedy in cases of serious illness. Prevention is the only sure and profitable remedy for disease.

But some of the minor diseases may be profitably and successfully treated, and of some of these I propose to speak in a future letter, for experience has taught me that drastic measures and sometimes simple remedies will save valuable birds, which may for a season or two make a good profit for their owners as layers, and then go to the markets as first-class poultry, without danger to the purchaser or loss to the owner, though I do not consider birds that have recovered from any disease as suitable for use as breeders.—H. L. Goodwin in Maine Farmer.

Orchard Poultry Run.

There is no more ideal place for raising poultry than in the orchard of apple, pear, peach, cherry and plum trees. The poultry must have some grounds over which they can run for feed and exercise, and in the orchard they will do less damage than any other part of the place. They will not only not injure the trees and fruit crop, but they will eventually do them good by eating fallen and decayed fruit and keeping down the number of troublesome insects.

The good orchard is cultivated annually or kept in sod, and is clean and free from weeds and other tall growth during almost all of the year. This condition permits the poultry of wide range without becoming lost in rank vegetable growth or wet with heavy dews. Where the orchard is cultivated during the early part of summer and sown to some catch crop later in the season, the birds are enabled to pick up an immense amount of animal feed in the form of worms and insects, and to scratch and wallow in the loose soil. In late summer and fall, while the catch crop is growing, they have ideal feeding grounds among the plants of the growing catch crop, and if the catch crop bears seed, none of it is wasted, but it is turned to good account in the form of meat or eggs. where the orchard remains in sod and is mown several times during the summer, the new, tender grass coming up after each mowing makes the best of green feed for both old and young poultry of all kinds—chickens, ducks, geese or turkeys. Insects breed in sod, and the poultry will aid in keeping down the number to a normal limit, which is a great benefit to the orchard. A sod also makes an ideal winter range for poultry.

An orchard is a most ideal place for poultry in summer, and especially during the very hot weather. Where the colony system of poultry culture is practiced, the small house and coops may be distributed all over the orchard and keep in the shade during the hot weather and removed to a sunny position in cooler weather. Under the shade of a fruit tree is an ideal place for a coop of chicks or for the brooder.—Western Poultry Journal.

The Balanced Ration.

So very much is continually being written about the balanced ration for fowls that one is at a loss to tell just where science will land us. Many can not even tell the true meaning of the balanced ration described as protein, nitrogen and other elements or component parts, but when we say that the balanced ration is that assortment of grain food or other foods best adapted to sustain life, supply all the demands of Nature, and furnish a full egg supply, we have an understanding of what is meant by the balanced ration. It has been fully demonstrated that what is a balanced ration for one cow will not meet the demands of another, and it is quite likely that as we progress we shall find that the same is true of hens. For this reason we can only have what might be called average ration for a lot of fowls. Wheat, oats, corn, and animal food are, in fact, all that would be absolutely needed in winter, with the addition of green food; at the same time additional grains are a benefit, because they furnish more of a variety of foods, and in this there is the advantage of a larger assortment, which may make the ration more fully meet the demand of a greater number of hens. We say variety is the spice of life; to the hen a variety of grains is a pleasing change as well as beneficial to the egg yield.

Feeding Platforms.

A hen will pick her food from the mud and litter of the poultry yard, or she will eat it "off a plate." Both methods represent extremes; but since cleanliness is a most important thing in solving the "winter egg problem" the chickens should be fed in such manner as to prevent unhealthy conditions.

I have found the board platform best for serving soft and cooked food, scraps, etc. It is better than a trough or a gravel bed, for the reason that it can be kept clean. Twice a week the board platform which is large enough to accommodate all the chickens of the yard without crowding, is washed and sprinkled with lime water. In fact, I attempt to keep it so clean that a person could almost eat off of it. Why not?

Water is given in shallow pans twice a day, and these have a place on similar, but smaller platforms. In this way, the hens do not wade in mud, or form puddles close to their drinking place, thus getting clean, pure water at all times.

Since adapting this plan of feeding from board platforms, and using the same precaution in the matter of keeping the hen houses clean, the "winter laying problem" has ceased to be a problem. Give the hen clean food, pure water, and clean quarters, and she will take care of the laying end of the proposition without further trouble.—Dennis H. Stovall.

The New Standard of Perfection.

We say much about the stgndard of perfection for fowls. Why is it, I wonder, that nobody has thought it advisable to form a standard of perfection for fowl fanciers? It would be something like the following:

Head—Level and broad, but not flat, with tuft of brilliant feathers.

Beak—Tranquil and silent.

Eyes—Fearless and determined.

Comb, face, ears and neck—Clean and well trimmed.

£ Wings—Buoyant; ready to fly over any emergency. Wing-fronts strong and muscular, which is plainly shown; primaries always ready to clutch the hammer or saw and never in anybody else's pie, secondaries, willing to feed and water on time.

Back—Stiff, and not easily bent. saddling impossible; under color true clear to the skin.

Tail—Strictly true to color; no haggled spots and is never thin.

Breast—Warm, ready to meet a friend or a chick in distress more than half way.

Body and fluff—True blue; no white feathers.

Feet Firm on ground! no fancy flights in air.

DISQUALIFICATIONS.

White feathers, cold feet, flat head, irregular feeding or care, lazy bones. Sometimes the forgetter is so prominent that the judges have to throw the critter out of the show room.

Are you a poultry raiser? Do you come up to the standard? If not, why not?—Marie Burritt Topping.

Poultry Notes.

Regularity is the key-note of success. Comfort brings health and productiveness. The art of egg production needs more study than that of egg preservation.

The business hen is one bred for the production of a good supply of eggs and meat and not for fuss and feathers.

The best breed is one that suits one's purpose best.

Old fowls require less feed than young ones and it is a mistake to overfatten them.

The profits in poultry culture are measured by the care given.

A poultryman is judged by his surroundings and the condition of his fowls.

The enemies of the fresh egg market are the preserved and the tested out incubator eggs. Be above such trickery.

Split carrots, turnips and cabbage in half, instead of chopping fine.

A box of crushed oyster shell should always be within reach.

Be certain the eggs intended for the wooden hen are perfectly fresh. It is best for the eggs not to be over five days old. Fresh eggs bring stronger chickens. Turning the egg once a day previous to putting them in a machine will prevent the yolk from sticking to one side. It is important to change the position of the trays after turning the eggs, so that the eggs that were on the left side of the machine will be on the right and those which were in the back will be in front. In cooling the eggs or stirring them, do not cool the incubator; keep it closed while the eggs are out.

The scratching shed is the workshop for the busy hen. Don't keep a lazy hen, for she is not worth her keep.

Old Hens.

Quite a common cause of a small egg supply is that the laying stock is too old. The ordinary class of hen does not pay for her keep after she is two years old, and birds older than this should be disposed of. Exhaustive experiments have proved that a hen is in her prime during her first and second seasons, after which time she ceases to be profitable. Young birds that are two years, or under, only should be relied upon for the winter egg supply.—E. T. Brown.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Send Them to Bed With a Kiss.

O mother, so weary, discouraged,
Worn out with the cares of the day
You often grow cross and impatient,
Complain of the noise and the play;
For the day brings so many vexations,
So many things going amiss;
But, mothers, whatever may vex you,
Send the children to bed with a kiss.

The dear little feet wander often,
Perhaps, from the pattern of right,
The dear little hands find new mischief
To try you from morning till night;
But think of the desolate mothers
Who'd give all the world for your bliss,
And, as thanks for your infinite blessings.
Send the children to bed with a kiss.

For some day their noise will not vex you,
The silence will hurt you far more;
You will long for the sweet children's voices,
For a sweet, childish face at your door;
And to press a child's face to your bosom,
You'd give all the world for just this
For the comfort 'twill bring you in sorrow,
Send the children to bed with a kiss.

Love's Barrier.

(Continued from last issue).

CHAPTER XV.

UNDER THE STARS.

Jimmy Bates having taken coffee into the study, and settled his master and mistress for the evening, retired beaming to supper in the kitchen beside Hannah. Secretan threw himself into his own chair and watched Helen while at the side table she made the coffee to his liking. She was mistress of all those delicate arts which make a man prize his home; she never forgot the cigarette, the match-case, the last new book, or the paper he most wished to see, the page turned at the choicest bit. Her figure, while she stood with the heavy folds of the velvet falling straightly about her feet, was all grace. Where the lace fell from the sleeve, he caught the beautiful white contour of her shapely arm. Secretan was very much in love, and his heart ached intolerably. But his spirit was heavier still, because of the burden that had not been lightened by his visit to Bradfield and his conference with his Bishop. The Bishop was an austere man, married, it is true, and possessing an exemplary family, but he put church and creed before the ties of the flesh, and had left Secretan in no doubt as to the course he must pursue. He had been kindly sympathetic and deeply interested, but absolutely decided.

"I hope you are feeling better now, dear," said Helen, as she handed him his cup. "You shall not have any sugar to-night. I recommend black coffee, unsweetened, as the first of stimulants. Try it. Did I tell you Tom Courtney had had a tussle with Sir Anthony Brede?"

"No; tell me about it," said Secretan, eager to gain time.

Helen related the incident, and laughed over it a little, and passed on Jane's comment.

"Jane and you seem to have had a long confab this afternoon," he said, when he had drunk his coffee; but he did not offer to touch the cigarette.

"We had; she was quite delightful. I can't think how you lived so long beside your sister, Claude, without discovering her."

Secretan smiled.

"It is all right, if you are the discoverer."

"Well, but your blindness does not do you any credit."

She set down her cup, and took her own chair, which had come from Colchester with one or two treasures which Cynthia had been obliged to give up. It was a prie-dieu, very straight in the back, with a strip of faded needlework which Helen prized because it was the only piece of her mother's handiwork she possessed. She liked the chair with the straight back because she did not belong to the lounging order of women.

"Claude," she said, looking straightly at him. "Why didn't you tell me you went to see Jane, yesterday?"

His face reddened a little, at which she laughed.

"Did you think I would mind? I should never be alarmed at your discussing me with Jane, so please don't forget to tell me next time you do it."

"Did Jane tell you what passed?" he asked awkwardly. "You will believe I did not set out with that deliberate intention, Helen? As I took my walk I seemed to turn naturally to the Court, and, of course, when I was so near I went in."

"Precisely what Jane said; but, dear, I do assure you there is not the smallest need to be apologetic about it. I am quite pleased, really."

Secretan sat up suddenly, and his face seemed to harden, or at least to set itself into a line of purpose.

"I am rather glad that you mentioned this, Helen; it gives me an opening. I suppose Jane told you that—well, that I am very much concerned about the way we are going on."

"She did not say that exactly. She said you did not like my not going to church, and all I said was that you and she must have a little patience. I promised nothing. I believe that I have even been a little better than my promise, and I am very sorry you are so dissatisfied."

Her voice took a colder note, and Secretan visibly winced.

"But, Helen, will you let me say something without taking instant and dire offence? When you promised nothing, as you say, I did not quite realise what it meant. I took it relatively to myself, and I have no complaint to make of your treatment of me. I hope you can say the same?"

"I? Oh, I am perfectly satisfied," she said, dropping her eyes on her lap, where her fingers played. "I—I appreciate your kindness and forbearance and consideration more than I can say, and I have tried to show it. I sometimes thought I had succeeded."

"I appreciate all you do for my comfort. As for the more personal side of things, I was prepared to wait—seven years, I think I said—and think them short if I could win you. But that is not what I wish to speak about to-night."

"I know you think I'm a heathen, and you're tired of having a heathen wife," she said hardly.

"You express yourself rather strongly," he said, trying to speak gently, though every word stung like a two-edged sword. The Bishop however, had been insistent on patience and forbearance, even while he made clear the pathway of his duty as a man, a husband and a Christian priest.

"It is not for myself I plead, Helen; I have known many church-goers far more remiss in their duty than you. But it is the example. My people are a simple people, and they do not understand. I want you to reconsider the whole question. Let us talk it over, and see whether we can't come to a fresh arrangement, whether you will not concede something for the sake of others."

She made no reply.

"Your continued refusal to recognise the ordinances of the Church, your complete abstention from Holy Communion, have filled everybody with astonishment, distrust and a little pain. They talk of it to me everywhere, asking me why. I am dumb before them, and I feel that my influence in the parish is being slowly undermined."

"It cannot be built on a very solid foundation, if that can undermine it," she said in a low voice, which, however, had no softness in it.

"If you would only try to look at it for a moment from my, from their point of view, you might be able to grasp the situation. Meanwhile, you see only one side of it," he said slowly. "There is so much in the parish only a woman can do; the mother's meeting, the Bible class, the sewing guild, are all suffering. I mean they are missed, because they do not exist."

"Then you should have taken my advice and kept Jane in the parish. Remember, I wished it, and if you had insisted there is no doubt that she would have stayed on in the Rectory."

"But I did not wish it, nor would it have been advisable from any point of view—yours, or hers, or mine. Besides, it would not have altered the situation in the smallest degree. The duties I have mentioned are yours, and not hers."

Again she gave him no answer.

"Helen," he said, leaning forward, his face flushed in his extreme earnestness, "won't you concede something even for appearance' sake? I don't know what foolish and stubborn objection you have to attending the church services, what you are waiting for. If, as you say, you are grateful for any small personal consideration I may have shown you—though, Heaven knows, that is the last point I wish to press—think it over, and for the sake of that meet me at least half-way."

She sat looking down, her fingers working nervously. He did not know what headway he had made, but his next words were fatal, and undid any good he might have done.

"The Bishop says that there cannot be two opinions as ——"

He did not finish the sentence, for Helen sprang to her feet, her eyes blazing.

"The Bishop! Then that was your business at Bradfield, your diocesan business, to discuss me with the Bishop!"

"I went for that purpose," said Secretan quietly, though his face began to flush ominously. "I could not bear my own thoughts any longer. I felt I needed the counsel and opinion of someone in authority on what the Bishop very rightly calls a public scandal."

Helen smiled an exceeding bitter smile.

"So that is what I am—'a public scandal,'" she said slowly. "Thank you, very much. Now I know where I am, and now I know, too, the hideous bondage in which you so-called religious people live. I was not mistaken in them after all."

Secretan clenched his hands. He loved her, but above his love for the woman, loyalty to his faith stood high as the stars above the earth.

"I forgive what you say, Helen, though it is not to me you are showing such disrespect. I see that I have been too weak all along, that I ought to have insisted more on such poor authority as the law gives me. I ought to have required your obedience in matters which affected—affected my work, and the paying of outward reverence, at least, to the Church ordinances."

"Obedience!" she said. "Obedience! Are we living in the twentieth century? Was it bread and water or the scourge the Bishop recommended for the refractory wife?" she asked mockingly. "I have been trying slowly to walk along the pathway of duty, to learn things, and I have learned from Jane, never from you. You are a hypocrite! What you would have me do, to go and kneel there in the church with a lie on my lips and in my heart, is hypocrisy! But that apparently is of no account, so long as a good appearance is made before the world! And I thought you were different! Oh, what a mistake it was, what a mistake!"

She wrung her hands passionately like one distraught, and ran out of the room. Secretan, with great beads of perspiration standing on his forehead, sank into his chair and covered his face with his hands. Even in the anguish of the moment, when he had come for the first time in actual conflict with her strong, passionate nature, he felt a strange peace. For he had not wavered. Indiscreet, unwise in his choice of words, in his method, he might have been, but he had risk-

OPERATIONS AVOIDED

By Lydia E. Pinkham's Vegetable Compound

Belleriver, Que.—"Without Lydia E. Pinkham's Vegetable Compound I would not be alive. For five months I had painful and irregular periods and inflammation of the uterus. I suffered like a martyr and thought often of death. I consulted two doctors who could do nothing for me. I went to a hospital, and the best doctors said I must submit to an operation, because I had a tumor. I went back home much discouraged. One of my cousins advised me to take your Compound, as it had cured her. I did so and soon commenced to feel better, and my appetite came back with the first bottle. Now I feel no pain and am cured. Your remedy is deserving of praise."—Mrs. EMMA CHATEL, Valleyfield, Belleriver, Quebec.

Another Operation Avoided.

Poughkeepsie, N.Y.—I run a sewing machine in a large factory and got all run down. I had to give up work for I could not stand the pains in my back. The doctor said I needed an operation for womb trouble but Lydia E. Pinkham's Vegetable Compound did more for me than the doctors did. I have gained five pounds. I hope that everyone who is suffering from female trouble, nervousness and backache will take the Compound. I owe my thanks to Mrs. Pinkham. She is the working girl's friend for health, and all women who suffer should write to her and take her advice.—MISS TILLIE PLENZIG, 3 Jay St., Poughkeepsie, N.Y.

Thirty years of unparalleled success confirms the power of Lydia E. Pinkham's Vegetable Compound to cure female diseases.

"Best for Baby—best for you."

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.

Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use Gates' Life of Man Bitters and Invigorating Syrup No. 1. and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers.

Yours very gratefully,
John W. Margeson.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

FALLING SICKNESS

Fits, Epilepsy, St. Vitus' Dance, Nervous Troubles, Etc., positively cured by LIEBIG'S FIT CURE. We will send trial bottle FREE if you will mention this paper. Write the LIEBIG CO., Spadina Avenue, Toronto.

Persons troubled with partial paralysis are often very much benefited by massaging the affected parts thoroughly when applying Chamberlain's Liniment. This liniment also relieves rheumatic pains. For sale by all Dealers.

ed something for conscience' sake. It was an agony to be at war with the wife he loved, but he must be true to his vow of consecration. "Whosoever loveth father, or mother, or husband, or wife, more than Me, is not worthy." He fell upon his knees. Helen sped upstairs to the small, quaint sitting-room she had arranged for herself, and where he dared not follow her. With one of the little flashes of mystery and reserve which served only to bind him to her, she had told him that there he must not come without invitation, that it must be her sanctuary. She had played upon his heart like a harp of ten strings, and now that growing and dear intimacy had been sharply cut by his own hand, and the seven years of waiting seemed to lose themselves in illimitable space.

Helen did not long remain in sanctuary. It had no message for her soul that night. She drew a pair of overshoes over her house slippers, put a hooded cloak about her head and shoulders, and slipped downstairs. She must have the big sky in this crisis, space, wideness, and the protection of the kindly night. So light was her footfall that Secretan did not hear it, nor the slipping of the bolt back in its well-oiled groove.

It was bright moonlight overhead. Although March was now well forward, the world in these high latitudes was still in the icy grasp of winter. The moor was not far off. A short walk across the churchyard, a step through the wicket, and it lay before her in its immensity, its loneliness, its great awe.

She had no fear, nor need she have had; there were no evil beasts in Midcar to molest simple people in their walks. The moor had no tales of blood or woe to terrify the imagination. It was a kindly place where flowers were wooed to blossom, and wild things were safe. The night-wind was cold, but Helen let her hood fall back, so that it played unhindered on her hot face and stinging eyes. She was very proud, and her pride was outraged by the vision of two cold churchmen discussing her and dissecting her motives, deciding how she could be brough to a better frame of mind. That Claude, the man who had behaved with such forbearance and chivalry throughout, should have lent himself to this, placed him in her estimation on a level with all the other selfish male creatures she had known. They were all alike, she told herself passionately, they must dominate whatever defenceless creature they had in their power. But she would not be dominated; only that morning she had been so full of kindly feelings to the little place, full of appreciation of her husband's character and standing in it. She had paid a visit to a poor home, where a little child lay ill, and there heard of his tenderness, his true and practical kindness of heart. They had thanked her for it with tears in their eyes. Even against Jane her anger burned. She was no longer a house of defence. For though she had not said very much that afternoon, yet her few words brought her in line with her brother's argument. Helen went back to the intrigue, the suspicion, the unbelief, which she thought she had put from her as a garment for which she had no further need. She told herself that brother and sister were in league against her, and that Jane had known of the visit to the Bishop and its object. She wandered up the beaten road which the feet of many moorland folks had made hard and efficient, and, losing touch with the lights of the scattered village, felt herself alone with the stars.

Something seemed to lay a caressing, healing touch upon her panting heart, and even a small, quiet smile stole to her lips. She felt a sudden shame of the passion that had rent her. The occasion was hardly worthy of it; a cold invincible front would have been at once more dignified and more convincing. But certainly she would not be driven like a sheep to the sanctuary. They would find she could be as determined as any Bishop. If only he would have the courage to come to Midcar Rectory and give her a chance to assert herself! She sat down presently on a heap of boulders that rose grotesquely by the wayside, and then became conscious that someone was approaching from the opposite direction—a woman's figure of ample proportions, carrying what appeared to be a market basket. Helen sat still to await her approach, conscious of that swift weariness which so often follows upon an ebullition of unusual force. The figure looked like Ann Coyne's in the elusive distance, though why Ann should be on the middle of the moor after nine o'clock on a winter night passed her comprehension. It did not occur to Helen to think that whoever the pedestrian might be, she was bound to feel surprised at the sight of the Rector's wife in that lonely place.

It was Ann. The full moon shone upon her comely face and ger startled eyes.

"Mercy me, Mrs. Secretan, it's nivver yo!" she said, with a great, deep breath drawn up from her ample bosom. At the same time she set down her basket and incontinently stared.

"Yes, it is I, Ann. I fancied a mouthful of fresh air, and I'm not at all afraid. Lovely out, isn't it?"

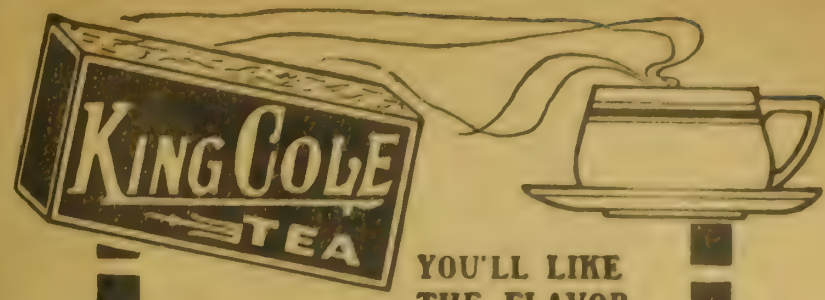
"Yus, it be. Well, a breath ov the fresh air be Goad's own gift, sure, but it's a tidy bit to coom for it. What does th' Rector say to them neet wanderin's?"

"Same as Coyne says to you, I suppose," replied Helen, with a short laugh. "Won't you sit down for a moment and tell me where you've been? Then we can walk back together."

Nothing loth, though not yet recovered from the shock of surprise at her meeting with the Rector's wife, Ann seated herself on one of the opposite boulders, where she could obtain a good and clear view of Mrs. Secretan's face.

"A'a been a'a the day at Isaac Brettle's, t'other side ov th' moor near by Lips-Ghyl. His wife, 'Lisbeth. shoo died at three this arternoon."

"How did we not know about it, Ann? Mr. Secretan went to Bradfield this morning, and if he had known that anyone was so seriously ill he would, I am sure, have stayed at



YOU'LL LIKE THE FLAVOR.

Ardent tea-lover though you may be—you have yet to learn a *deeper* enjoyment of your favorite refreshment!

The one quality above all others which has endeared tea to your taste has been multiplied. *Flavor* has been developed to a *truer* fullness, *richer* smoothness.

You'll learn how very, *very* much this means to you in *real* tea-joy when you sip your first cup of King Cole Tea.

Your only regret will be that the expensive study of flavor-blending which resulted in King Cole Tea wasn't started sooner.

Why take Chances when You Don't Have to?

It is poor policy to buy a cheap stove to save a few dollars in the first cost and pay twice as much extra EVERY YEAR for repairs and additional fuel.

If you install in your home an

Enterprise Monarch Steel Range

you will run no risk, as it will save you money and your wife care and anxiety. Just think, wouldn't such a Range be a Christmas gift that would benefit the whole family?

The **Monarch** with its modern equipment is the stove makers' greatest gift to the housekeepers of Canada in recent years.

SEVERE COLD
DEVELOPED INTO
PNEUMONIA

—

DOCTOR SAID HE WOULD NOT LIVE.

—

Next to consumption there are more deaths from pneumonia than from any other lung trouble.

There is only one way to prevent pneumonia, and that is to cure the cold just as soon as it appears. Dr. Wood's Norway Pine Syrup will do this quickly and effectively.

Mr. Hugh McLeod, Esterhazy, Sask., writes:—"My little boy took a very severe cold, and it developed into pneumonia. The doctor said he would not live. I got some of your Dr. Wood's Norway Pine Syrup and he began to improve right away. He is now a strong, healthy child, and shows no signs of it coming back."

Do not be talked into buying any oth Norway Pine Syrup, but insist on getting the original "Dr. Wood's." It is put up in a yellow wrapper; three pine trees the trade mark; price, 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

OPENING

Tuesday Evg., January 23

at 8 o'clock, continueing in session Wednesday and Thursday, January 24th and 25, 1912.

A full and interesting programme is being prepared.

Return fares at single rates are arranged for on the Standard Certificate plan.

CHAS. R. B. BRYAN, Durham, N.S.
Secretary-Treas.

home to visit her."

"Shoo beaint in Midcar parish. Shoo's wan ov Iffley folk. Nobbut it wad ha' made anny difference. 'Lisbeth needed no parson. Shoo wur a varry good parson hersen. Manny's th' lesson A've larnt fra her."

"Tell me about her. How did she manage to be so good? I suppose she had everything her own way over there. Was she a farmer's wife?"

"Noan; her man is bailiff to Lord Durham. An' she nivver 'ad 'er own way to ma knowledge fra the day she was born to the day ov her death."

"Dear me, was the bailiff such a tyrant?"

"I doan't wish to speak ov him, Mrs. Secretan. A'a promised 'Lisbeth not. Men, they canna help theirsens. Some's good, some's reet bad, but th' great peck ov them's middlin'. Says I to 'Lisbeth one day when Coyne he war verry tryin', 'If theer's to be anny men fowlk in Heavin, A'am not goan theer.' And she smiled at me an' gave her bit quiet laugh. A'a was yaung then, an' my temper wur often oop. Says shoo verry gentle loike, 'Think av the lonesomeness, Ann, if thou and I had nobbut to mother.' "

There was an undercurrent of tenderness in Ann Coyne's voice which went home in some strange way to Helen Secretan's heart. Ann had a wonderful gift: she had read the expression on Helen's face, and guessed that all was not well.

"Theer's noan manner ov doot, ma dear," she said, as she folded her arms across her broad bosom, "that Goad has a verry special worrk fur us wimmin to do here in this world. It begins with patience, and middles with patience and ends with patience. Theer beant annything else. 'Lisbeth she onderstood the Lord's will reet alang; she nivver medd noan foight like—like the maist ov us dew, and now she's left it aa, and a man thet would gie his reet hand, aye and his left, to git 'er back. No, he wur noan guid till her in life, but thet's theer wey, puir creturs, they dinna understand."

"Ann," said Helen, with a startling suddenness, "you have been very kind to me since I came to the parish, and to-night somehow I feel that you are my friend. What do they say about me here? Have I—have I sinned and come so very far short?"

Ann drew a small, quick breath, and sat forward eagerly.

"Ma dear, yo've getten many friends in th' pairish, becos ov they sweet ways and thet winnin' look, which soometimes mekks tha luik so loike a babby aboot th' eyes. But there's manny a sore heart in th' parish becos tha nivver darkens th' kirk door. It confuses them loike. They dinna understand, an' we looves oor Rector. He be an owd friend, an' he's gettin' to look as if somethink has gaan ooten his life. Ma dear, A'am an owd woman, and yo're a young one, A'am a poor common body, and yo're a real leddy, but this A'a can tell tha an A'a will—tha's on th' wrong tack aathegither."

"But why? Do you think it is not possible to do one's duty without all this church-going? I don't care for it. I have never been used to it. It doesn't mean anything to me. I should be making a hypocrite of myself, Ann, if I were to go to church, feeling as I do."

"A'a nivver heerd as how th' church wur to be kep speshul loike for guid folks. If it wur, it wad be empty enow. We go theer to learn to be better an' because it's oor Feyther's haas. Thet's how A'a luk at it, and how it be, ma dear."

"But what I can't understand is why people should trouble about me," said Helen insistently. "I am only one small insignificant creature."

"Nay," said Ann, with a touch of loving pride, "tha's oor dear Rector's wife, an' we luves him. In tha pew

This Man is Young at 55 Years.

He is a "Health Belt Man;" therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life---be a "Health Belt Man" yourself---it gives manly strength; it makes you young and keeps you young all the days of your life; it takes all the coward out of your make up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you?

The secret of life-long youth may be summoned up in one wodr—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none. Just the Health Belt. No privations, no dieting and no restrictions excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed: let it send its power into your nerves, organs and blood while you are s eeping. It gives you a great flow of soft, gentle galvano-vital electricity during the entire night. One application and you are like a new beng; it takes all the pain and weakness out of your back; it makes you answer the mornings greeting with 'I'm feeling fine." It is a great strength builder: it overcomes the results of earlier mistakes and indiscretions; gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three month's use is sufficient. S. Coolen, Hubhards Cove, N. S. writes: "I am a man again, thanks to you. Nothing can discourage me now."

This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Nature Cure Books FREE

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

ov a Soonday, wi' the Soonday light upon tha face, you'd be a loight to manny a heavy 'eart. Take it loike thet, and leave the rest with Him that's yander."

Ann rose, took up her basket, and pointed upward to the stars. Helen rose, too, and turned to walk by her side. They had further converse as they walked, and somehow the whole inwardness of Helen Secretan's heart passed into the keeping of the plain moorland woman, who, by reason of her communion with the Unseen, had a compelling power.

They parted under the shadow of the Rectory yews, and Ann Coyne went home to pray.

Helen let herself in very quietly with the latch-key, which never left the pocket of her cloak, and without waiting a moment—nay, bracing herself to what was a mighty effort—she marched to the study door. At the moment that her hand was on the door the clock struck ten.

Secretan was sitting at his desk writing busily to the Bishop, no doubt, Helen thought, but she pushed back the hardness which would have arisen.

She came forward swiftly and laid a very light touch on her husband's shoulder. He lifted his face, a little haggard and worn, to hers, and she was struck by the sharpness of his outline, its purely ascetic look.

"I have been wrong Claude," she said in a low voice but very clearly. "I am sorry for it. I see now that one cannot live altogether to oneself. You may write and tell the Bishop," she added with a faintly wandering smile, "that no discipline will be necessary. I will come."

(Continued in next issue.)

Elinor Newbold's Housekeeping.

Elinor Newbold, tired and flushed, was nervously setting the table in her tiny dining-room. John had telephoned that he would bring home to dinner that evening two of his college friends, but Elinor's maid-of-all-work had gone away for the day, and what was she to do?

She had been married to John only three months, and although they had had many little misunderstandings, ledge of housekeeping. Had she not kept house for her parents before her no great trial of their affection had occurred, and their life together had been very happy. One thing that Elinor prided herself on was her know-marriage? But all she had to do then was to give her orders, which were generally carried out, as her mother's servants were always experienced.

'Do not hesitate to invite any of your friends to dinner,' she frequently said to her husband. 'Only let me know in time so that I may have something nice prepared for them,' and now the opportunity had come to show her ability.

John was proud of his handsome wife, and equally so of their cozy home, and so when on his way to business he ran across two of his college chums, what more natural than that he should invite them to dine with him that evening? To be sure, Elinor had said something that morning about Maggie's being off for the day, but that did not matter. Elinor always knew what to do, and he had telephoned as he said he would.

Proud and happy, the young bridegroom ushered his two guests into the pretty parlor. Taking two steps at a time, he rushed upstairs and into the dressing room, expecting, manlike, to find Elinor daintily gowned, waiting for him with a smile and kiss that meant so much to him. No Elinor was to be seen. He tramped through the adjoining rooms calling her name. Hearing nothing he at last thought of the kitchen.

'My dear girl!' he exclaimed, 'what has happened? and what have you done to yourself?' he added.

Elinor was indeed a pitiable looking object, for, in her anxiety to have the dinner ready on time, she had piled the fire box so full of coal that it could scarcely burn, and her face and hands were black, while her dress was covered with flour.

'Oh, John!' she cried, putting her grimy, tear-stained face against his shoulder, and sobbing aloud, 'how could you?'

'How could I what?' asked the astonished man, thinking Elinor had taken leave of her senses.

'Why did you bring those me-men?' she sobbed, 'wh-when you knew Maggie had go-gone. I am so tired trytrying to cook the dinner,' she added, bitterly.

'Now I remember you did say something about Maggie this morning,' replied John, kissing the flushed cheeks of the tired little woman. 'But you know, dear, you have always said that my friends would be welcomed at any time, and you have kept house so beautifully since our marriage I wanted them to see what a treasure I had won. I am very sorry,' he added, ruefully. 'Shall I tell them you are not able to see them, and take them over to the club?'

'Oh, no, no!' exclaimed Elinor. 'But, John, it is so different when I have to do it alone. Before I was married, all of mother's servants were well trained, and I simply gave my orders, and since Maggie's coming she has done most of the planning. But I did not realize how little I knew until I was left to myself ——' and she sobbed afresh.

'Never mind, dear,' said John, soothingly, taking her in his arms. 'Give us what you have ready, and we will have a good time over it. You remember I know something about cooking, so go and make yourself pretty, and let me see what I can do.'

A loving hug followed his cheering words, and the little bride stole crestfallen up the backstairs, feeling that the only thing she was capable of doing well, was to make herself presentable to her husband's guests.

Not long after a dainty figure appeared in the kitchen. All traces of soot and tears had been removed. A fire was burning brightly in the stove, while the aroma of freshly-made coffee filled the air.

'See, dear!' said the delighted John, 'Won't you hire me for your chef?'

A can of soup had been opened, and was heating on the stove, while the peas Elinor had shelled with trembling fingers that morning were simmering in a granite pot nearby. The chops already on the broiler were browning beautifully.

What should I do without such a dear, good husband!' cried Elinor. 'You have saved my reputation, if not my pride. I can at least make the dressing for the salad, and the ices and cakes are in the pantry. So while I do the fancy fixings just run and put on a clean collar', and Elinor pushed her perspiring spouse from the kitchen, feeling she was once more master of the situation.

A merry party sat in the little dining-room that evening. The men were charmed with Elinor's beauty and vivacity, and the daintily-spread table with its shining cut glass and silver came in for a share of admiration. John had laughingly said that as their maid was off for the day, the 'entrees' were not as numerous as they might have been.

No one noted the absence of an elaborate dinner, for the men envied John his good fortune, and did not wonder at Elinor's ability to make him happy.

That evening after their guests had gone, Elinor Newbold put her arms about her husband's neck and rested her tired head against his breast. 'Dear,' she said, very softly, 'I pity all young married women if they understand as little about the real practical part of housekeeping as I do, for I am sure not one of them,' she added, 'has as good and patient a man as you are. But don't be discouraged; I am resolved to take lessons at some good cooking school this year, and,' she continued, 'you may invite your whole college and not be ashamed.'

Mrs. A. R. Talor, of Crider, Mo., had been troubled with sick headache for about five years, when she began taking Chamberlain's Tablets. She has taken two bottles of them and they have cured her. Sick headache caused by a disordered stomach for which these tablets are especially intended. Try them, get well and stay well. Sold by all Dealers.

Suffered With Nerve Trouble For Two Years.

WAS IMPOSSIBLE FOR HIM TO SLEEP.

Mr. Chas. W. Wood, 34 Torrance Street, Montreal, Que., writes:—"For two years I suffered with nerve trouble, and it was impossible for me to sleep.

It did not matter what time I went to bed, in the morning I was even worse than the night before. I consulted a doctor, and he gave me a tonic to take a half hour before going to bed.

"It was all right for a time, but the old trouble returned with greater force than before.

"One of the boys, who works with me, gave me half a box of Milburn's Heart and Nerve Pills. I took them and I got such satisfaction that I got another box, and before I finished it I could enjoy sleep from 10 p.m. until 6 a.m., and now feel good."

The price of Milburn's Heart and Nerve Pills is 50 cents per box, or 3 boxes for $1.25. They are for sale at all dealers, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont. will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child. the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

THE St. JOHN Business COLLEGE. S KERR & SON.

Last year we thanked the people for the best year we had ever had. This year we give most hearty thanks for a very much better one.

Our new term will begin Tuesday, January 2nd. Send for Catalogue.

S. KERR, Principal.

Furnishing a Farm House.

In furnishing a home, we farm women too often seek to imitate a style quite unsuited to our conditions and surroundings. For instance. the large, heavy carpets, that in the city would be sent away to be cleaned, would prove a formidable tax on a woman's strength; and it would indeed be a brave housewife whose courage would admit of asking assistance from the men during the stress of spring work. Hardwood and painted floors, with rugs of a size easily handled, are more in keeping with farm conditions. Deeply tufted, upholstered sofas and chairs will require a vast amount of time and patience to keep in a pleasing state of freshness, while easy chairs with movable cushions are more inviting and require far less attention. Good books and pictures will be the first consideration in a cultured home, and the occasional purchase of a thoughtfully selected volume is a wise and profitable investment. A well-ventilated sleeping-room, provided with the customary toilet necessities, with a simple iron bed-stead and roomy wash-stand, is more desirable than a stuffy apartment containing a massive set and a shortage of towels and toilet soap. If comfort and convenience be considered paramount to significance, we will make fewer mistakes in selecting our furnishings.

ADVICE TO THE WOMEN.

When one possesses a husband and a home, she should bear in mind that it matters not how warm and glowing a fire one may have kindled, that, if it would be kept burning, fuel must be added from time to time. And so it is with the fires of love. If treated with indifference and neglect they will soon smoulder to ashes of regret.

Therefore, if you are a wise woman, you will from the start plan a practical course by recognizing the fact that no man is an angel, consequently do not expect too much. And if you would make his home more attractive than any other place look well to his physical comfort. See that his meals are carefully prepared and served on time. You know you deceived him when you made him think you the dearest, sweetest girl on earth. Now, keep up the delusion. Never let him suspect that you are not. I have seen just an ordinary little woman, who didn't know much—you don't have to know much, men, as a rule, are content to know it all—fool her husband for thirty years, and even longer, and he'd never found out that she wasn't the sweetest, smartest and most lovable woman in the world.

I have actually known a woman of this kind to give her husband so good an impression of the sex that if he lost one wife he wouldn't hesitate to marry again. You can do this if you only try. Why, you can wind a man around your little finger, and he'll never be the wiser. Men are dependent creatures. Did you ever see one with a missing button or something gone wrong with his suspenders? He'll go calling through the house, "Mother, Mary, come quick I've lost a button." Now's the opportunity to show him you're the most wonderful woman on earth, for whenever a man sees another do something he can't do, he thinks it marvellous. Put on your thimble and sew that button on good and firm, while you casually remark that you don't know how he managed to get along without you. And he will wonder that he ever did. Oh, you can fool them in a hundred loving little ways. Men like petting, and many of them have been used to it for, if there is anything dearer to a mother's heart than her girls, it's her boys.

If you are a wise woman you will never let him miss his mother's sympathetic encouragement and approval. Remember that what is for his interest is for yours, and that he can work better and harder when he hears your cheery words of approbation ringing in his ears, and knows he will be welcomed by your happy smile. Make yourself a necessity to him, and take advantage of his every weakness. Men are conspicuously vain. Why, a woman's vanity is nothing compared to that of a man. Praise his every commendable effort. It will spur him on to greater achievements. Go out to the barn, and show an interest in the cattle. Commend his manner of feeding pigs. Jolly him up a bit by drawing flattering comparisons between his and his neighbor's methods. Yes, take a loving interest in everything on the farm. The barns will be sweeter and cleaner by your presence; the cows will be more tenderly cared for, and you will be so rich in joy that a more sordid ambition will be forgotten.

But there are three things you must not do if you would keep your husband's love and respect. You must not complain, you must not find fault, and you must not nag him. If you have a trifling headache never say, just as he is starting to his work, "John, I don't feel well." It will put a damper on his best efforts. Women were born to make believe, and you can smile, even if you're not feeling quite right, until he has left the house. Then, if it is any benefit to yourself, do yourself up in camphor, and groan to your heart's content. If you are really ill, go to bed and call a doctor, and you will then know the sweetness of a tender sympathy. John will exclaim; "Bless me, the dear little woman must be sick, for she never complains," and he will undoubtedly do all in his power to restore you to health.

Do not find fault when he's making every effort to succeed. Do not paralyze his ambition by saying: "John, I was over at neighbor Smith's and they have a new carpet and a rocking chair and a picture, and are going to have their parlor newly papered, and—I don't see why we can't have such things. We are just as good, and I work just as hard as Mrs. Smith. There must be something wrong with your management. I don't think you're very ambitious." Oh, if you value your happiness, don't do it. Can't you see you are pushing him away from you? Never for a moment let your husband see you have lost faith in his ability. Though he fail in many schemes, encourage him to try again. Though all the world loses confidence in him, if he is an honorable man, never let him know you are disappointed or that your trust has wavered.

I will tell you what to do: Put your arms around his neck and say cheerily, "John, dear, do you know what those foolish Smith's have done? They've bought a carpet and a patent rocker, and a lot of truck, and now they will have it to care for. I'm so thankful we have more sense. When we get enough money to pay for such trash we will use it to buy a cow." You may punctuate this with kisses if you like, and John will think, "Was there ever on earth such another sensible little body." Oh, you can fool them to the end, if you only understand your business.

And, above all, don't nag. A constant nagging would break the spirit of any man. You may have a temper (some women acquire one by inheritance), but you never allowed him to see the ugly side of it before you were married, and don't do it now. If you feel you must give vent to it, wait until he has gone; then grit your teeth, take a good solid chair, and shake it furiously. You can make believe it is John, and no harm will come to the delusion your husband is laboring under. John, all unconscious, will very likely be heard bragging about the even disposition of his wife. Still, if you are unable to control your temper, and if you must give John a piece of your mind, have it out, in a hand to hand conflict, if need be. It may clear the atmosphere, like a thunder storm. Still, I would not advise it, but it is better than nagging. Whatever you do, don't nag.

COMPANY AT THE FARM.

The usual monotonous round of indoor work is broken all to smithereens by the occasional appearance of one or more guests, for while some town-bred people shrink from the responsibilities incident to rural life, they are not unmindful of its summertime attractions. And when spring buds and bloom are beckoning in tantalizing fascination, the temptation to make a raid on some nearby farm house becomes so irresistible that a cheery voice will be heard calling to a neighbor: "It's a lovely day. Don't you want to take a drive in the country? I know a farmer who lives a few miles out. They're farmers, but they're nice people," is hastily added by way of apology for so obscure an acquaintance. "They own a big farm, and have lots of cows, sheep and chickens. Don't you want to go? Pshaw, they won't mind if you are a stranger; they'll be tickled to death to see us. Bring your children, and we'll have a fine time." Did you ever, right in the midst of house cleaning, when you were struggling to gain time by having a picked-up dinner, look out and see a load of jolly, daintily-dressed city people drive up to your door? Did you? And did you wring your hands in despair as the meagreness of the family larder flashed through your startled brain? No pie, no cake, no seasonable delicacy on hand, and then go forth to meet them and say, "I'm glad to see you," and at the same time feeling yourself the old hypocrite that you so heartily despise?

Now I beg of you, do not put those people in a stuffy parlor, and offer them amusement in the shape of a family album. They do not care a rap for the pictured faces of your "Sisters, your cousins, or your aunts." They may take a passing interest in the veil-decked bride or the chubby charme of an unknown infant, but it will not add to their good opinion of the restful side of farm life to have you rush to the kitchen and begin baking and stewing until your strength is exhausted and your nerves all aquiver. Do not let them carry back to their city homes the impression that you are an ignorant drudge whose sole conception of hospitality is an over-loaded table and an apologizing hostess.

There are refined, thoughtful people, who live in cities who do not come to you for a meal. They can buy that. But they do come longingly to the farm for what is priceless. They come for the peace and rest, and comfort that country life affords. They come to fill their weakened lungs with that rare oxygen of which we have so much to spare. They come to be in close touch with Mother Nature, and to lay their weary heads upon her soothing bosom; to learn something of her wondrous secrets, and for a time to break loose from the galling chains of formality.

Now, do not give them the idea that farm life dwarfs the intellect. Greet them with a cordial welcome. Let them see that while you may know nought of the latest social fads, you are quite familiar with every phase of your calling. Give them a part of yourself and a share of your wisdom. Take them to your clean barns, show them your gentle cattle, and call their attention to the individual merits of your stock. You may be able to quite astonish them with the glibness by which you can tabulate the pedigree of a favorite cow. Have a dignity and pride that will serve to the uplifting character

and attractive features of your profession, rather than assume a bearing that will tend to accent its defects. If you are the good housewife you should be, your bread and butter will be wholesome and palatable. If you have tea and coffee, well and good, if not, perhaps you have milk, in case of shortage in this liquid, there is water. Your table should at all times be clean, and it will require but a moment to lay the extra plates. Now, ring the bell or blow the dinner horn; call in the men. It will not be necessary to offer an explanation for having your help eat at the same table; your guests will readily understand that it is your usual custom, and one best suited to your conditions. Have a dignity and manner of your own, and it will be respected. Do not try to imitate ways unsuited to your means or mode of life.

"HONOR THY FATHER AND THY MOTHER."

Yet I have known of cases where fathers and mothers had toiled and saved and planned all the best years of their lives in order to give their children advantages of which they themselves had been denied. They had sent them to academy or college to obtain the education that should prove a potent passport to the esteem of all men, and these young people had returned vainglorious enough to feel the knowledge acquired had raised them superior to those who through long years of self-denial had made this educational training possible.

I have known these young men and women when entertaining some college friends to say: "Let's get father to wait." Perhaps father likes to eat in his shirt sleeves or with his knife. Well, what of that? Isn't it father's home? And such breaches of etiquette are mere trifles compared to the sneaking ingratitude of a nature that would postpone father's meal in order to cater to the good-will of a stranger.

Now is the time to show father the true value of a creditable education. Let him see that the money obtained by many sacrifices on his part was not misapplied; that it had helped him to make a man of you, and not a contemptible snob. Place him at the head of the table with the unmistakable air, "You are honored to-day by being permitted to eat with my father."

The man or woman, young or old, who is too good to sit at his father's table and eat father's bread in father's company, is not the person for you to cultivate. Cut the acquaintance at once, and let your aim in life be to move in a better grade of society. It may be that your father's clothes are not the latest cut; possibly they are sunbleached and shiny at the seams. Still, if you will stop to think, he may have been so occupied in his efforts to pay the bills for your improvement that there was little time for thought of his own apparel. Remember this, and that your filial obligation is a lasting debt of gratitude. See that it is paid in full, and with usury; for it his son does not show him deference you cannot expect others to do so.

NEED OF LITERATURE.

The progressive farmer of to-day needs no urging to supply his family with abundant and suitable reading matter, therefore, the country woman may be as well informed on both foreign and domestic subjects as one who resides in a city, and with the helpful influence of natural surroundings there is no reason why the home on the farm may not become a veritable paradise.

TO THE MEN.

While the task of home-making is more generally supposed to devolve on the woman of a family, each member, great or small, should bear a responsibility, and take both interest and action in preserving the dignity of home life, be it lowly or grand. Some men are utterly unconscious of the fact that they have formed an entirely erroneous idea of woman and her claims upon them. They are unable to comprehend the real nature and characteristics of the true type of an intelligent, refined woman. They do not know how to draw out and develop her finest qualities any better than some farmers understand managing a dairy cow to obtain best results.

They are laboring under the impression that all women are vain, frivolous, irresponsible creatures, who should be firmly held in subjection; that if a man is unable to provide one with fine clothes, jewelry, and social amusement she will soon become discontented and wretched. A greater mistake was never made. The real woman does not care for fine clothes, jewelry or social position. If she favors them, it is only because she believes such adornment pleasing in the eyes of the man she loves. Women were born to make believe, and I have known them to serenely smile while their hearts were breaking. No, she does not hinge her happiness on luxurious raiment. If she cannot command something better, she will take it, just as a starving cow will eat straw when she cannot get hay; but she will not thrive and develop all the tender possibilities that lie within the fertile soil of a glorious nature.

What she desires above all things is appreciation, love, and petting. It does not cost anything. She will never tell you, for the woman I have in mind is too proud to beg for what rightfully belongs to her. When you have taken this girl to share your fortune of either weal or woe, when you, by your protestations of love and fidelity, have severed the ties that bound her to the home of her girlhood, when she has willingly forsaken father and mother to cling only to you, make it your lifelong study and duty to see that she never has cause to regret the step that you are responsible for her having taken.

Be patient. Remember that heretofore she has leaned upon the counsel and encouragement of her mother, and now she is called upon to exercise her own judgment and skill. She will make mistakes; she wouldn't be human if she didn't. Commend her every effort, even if the result fall short. Let her see that you have faith in her ability to accomplish all things, and she will not disappoint you. Tell her she is the neatest, most orderly little housekeeper in the country, and you are proud to have the neighbors go through her kitchen. She will not fail you. Tell her if she keeps on improving she will beat her mother cooking. Why, man alive, she will do it every time. You do not know the qualities to be brought out and emphasized with a little judicious praise. Save her strength, because an ambitious little woman will place no limit on her endurance when she is bidding for the approval of the man she loves. Keep a watchful eye on her, that she may not overtax her energy; and if you cannot afford help, there are numerous ways in which you may render valuable assistance about the house.

See to it that she has an income or allowance that is quite her own, and for which she need render no accounting. Let her feel that you would gladly provide her with every luxury if it were within your power. Give her the chickens—you'll have a better flock of fowls—and see that she has the proper place and the needed assistance to enable her to show her skill and ability in their management. Say to her: "The money you get from this source shall be yours without question." You will find it will pay you well, for when taxes are due or you want to cancel a note, you will not have to go to the bank, you can borrow of your wife—she will have it saved.

No, women are not the extravagant creatures some men think them. Give her your confidence, and let her feel the blessing of your unbounded trust. Say to her: "Here is the pocket-book. There are such and such payments to meet, you know what we can afford as well as I; use the money as you think best." This liberty and confidence will be its safest guard she will never touch it without first consulting you. You will find it all there, and she will cheerfully make over her old dresses and trim her bonnets, year after year, until you begin to admire the more up-to-date clothes of some other woman.

Do not say "my farm;" This is a partnership affair, and the proper term is "our farm." Ask her advice on all business matters. If you do not see fit to follow her suggestions, explain your objections, and she will be satisfied. Let her be thoroughly conversant with your business methods; then, she will be less liable to fall a victim in the toils of unscrupulous estate adjusters.

Do not go about with your lips shut and your mind occupied on matters too weighty for her comprehension. If she timidly calls your attention to the merits of some new dish or improvement, don't carelessly say, "Oh, it's all right; if it wasn't you'd hear from me." Such comments will crush the spirit and ambition in any woman.

Do not take it for granted that she knows you love her, tell her so. I will give you a ration. Tell her three times a day that you love her—no roughage in this, if you please. Do not tell her in an indifferent way. You know how you said it the first time; now repeat it with renewed tenderness. Three times a day is not too often and many women can assimilate to advantage a much heavier ration. Do not be afraid to use endearing terms. Have a pet name for her, and call her girl, even if she be sixty or older. Youth and age are the times when love is best appreciated.

Do not complain that women fade, and that the stylish, lively girl is too often apt to change into a morose commonplace matron, for it lies within your power to prevent this transformation. A woman's heart is a strange creation. It is a sensitive plant, that sends out tiny, clinging tendrils, and if they come in contact with a cold unresponsive barrier, they will turn and seek sustenance elsewhere.

Sometimes she will transfer to her children the love and devotion that would have been gladly given to her husband had she met encouragement. Again the better part of her affectionate nature is bestowed upon clubs, charity work, educational aims, or ambitious schemes. Sometimes Satan, in the guise of one who understands her nature offers a glittering imitation of the more sdbstantial love she craves, and if she has been taught to regard indolence and luxury above honor and industry, her situation is indeed a perilous one. But, if from childhood she has been trained in a belief that humble duty conscientiously performed may bring greater reward and joy than a realized ambition, she stands serene and safe.

So long as she has assurance of her husband's love and confidence, she will never grow old or discontented. Tall sons and daughters, yes, and tiny grandchildren may mark the progress of years; but she, living in an atmosphere of love and appreciation, will remain forever young and attractive.

If we will but cultivate these little tender courtesies as painstakingly as we do our grains and grasses—if we will by daily effort and example sow the fertile seeds of a spirit of industry, sincerity, and appreciation in the minds and hearts of our little ones—we shall have dowered them with a higher education and a far more valuable legacy than lands and gold, for we will then surely find that all of earth and the greater part of Heaven is centred right in that little spot called Home.

Sunny Brae Sheep Ranch,
Markhamville, Kings Co., N. B., Dec. 20, 1911.

The Maritime Farmer,
St. John, N. B.

Gentlemen:

You may change my ad in the Farmer. Talk about an advertising medium! I have never tried anything like it before. Sold over one hundred and twenty head that I attribute to the Maritime Farmer. Yes, it's all right.

Jas. A. Telfer, Prop.

One of the Greatest of All Inventions.

Fortunately two things happened in comparatively recent years which when applied with good judgment furnish us with a fairly accurate standard of measurement of performance. The first of these things made the second possible, and is the invention of the Babcock Test. Of all the inventions that have marked the progress of agriculture, this is one of the greatest, and the unselfishness of Dr. Babcock in not having his invention patented, but instead giving it up for the people of the world to use, stands almost without parallel in the history of the nation, and stamps him as among our greatest men.—William L. Erbach.

The man who makes his business a pleasure is likely to live a good deal longer and get a good deal further than the man who makes his pleasure a business.

System in Housework.

The duties of the housekeeper, like those of the journalist, demand a knowledge of many subjects, even at the risk of this knowledge being superficial rather than profound. A slight knowledge of the chemistry of foods will enable her to select those best suited to the individual needs of her family; a slight knowledge of hygiene will enable her to observe its most essential laws, while some knowledge of the elemental principles of art will keep her safe from many glaring artistic blunders in both household and personal adornment.

But among all others, one of the most essential qualifications of a good housekeeper is an appreciation of the value of system in her work. The week's work should be thoroughly planned out, and each day receive its allotment of tasks.

There is a popular prejudice in favor of Monday as washday, but it is often far more convenient to set apart Tuesday for this purpose. This leaves Monday free to put the house in order after the Sunday disorder, to pick up and sort the week's accumulation of linen, replacing stray buttons, and taking the few stitches needful to prevent further enlargement of rents in the wash, and at night putting the white clothes to soak in warm suds. Some extra cooking can be done, in the preparation of such dishes as can be used in the next day or two.

On Tuesday the routine work should be made as light as possible, the mistress herself clearing away breakfast and washing the dishes and the same with luncheon, thus leaving the maid free to give her uninterrupted attention to the washing. Dinner should be of such dishes as do not require much time in their preparation. After dinner the clothes can be sprinkled and folded, ready for the next day.

On Wednesday almost the same routine should be observed, and such pieces of clothing as require further mending should receive due attention. During these two days little sweeping should be required—a thorough dusting will serve.

On Thursday morning keep to the usual routine work, with any necessary "extras" which may develop, this afternoon being the maid's day out.

Friday the general weekly cleaning should be done, sweeping, dusting, and washing of windows.

Saturday the silver should be brightened, and extra cooking done for Sunday.

Each one should be expected to take entire care of his own bedroom with the exception of the weekly sweeping and dusting.

It will be found of the greatest assistance if the mistress will make out a week's menu covering the three meals for each day. This would necessarily have to be modified slightly from day to day, but will be suggestive and will prevent that feeling of utter dismay and blankness which seizes the housekeeper who leaves her day's menus to plan until the butcher or grocer arrives for orders, or until she finds herself in the market. It will also be found more economical for on the impulse of the moment one will order things for which on second thought she would prefer to substitute for something else, or which could be omitted altogether.

Air in the Home.

Air, water and food are the great essentials of life. A man may go for days without food and hours without water, but deprive him of air for a few minutes and he ceases to live.

The air is "free" to all, and it is left to each one to regulate the quantity and quality of the supply to her home. Unfortunately air laden with the foulest and most poisonous substances can be inhaled without immediate knowledge of the conditions, but the effects are seen later in headache, drowsiness and other warning symptoms which in the case of habitually unventilated dwellings results in deficient nutrition, loss of vigor of body and mind and of the power to resist disease.

We reject dirty food for our stomach while using dirty air for our lungs, organs far more delicately constructed than the digestive apparatus, and needing careful consideration if we would have the best health and strength.

Go into the large majority of living and sleeping rooms in city or country, especially in winter, and you will find a reason for the spread of the "white plague," which is slaying thousands of our young people all over the land.

Fresh air, then, is a law of our well being. The average adult contaminates about five thousand cubic inches of air with every breath, and in ordinary respiration an adult abstracts sixteen cubic feet of oxygen from the atmosphere every twenty-four hours, and adds to it fourteen cubic feet of carbonic acid gas in the same time. Nearly one-third of the excretions of the body are eliminated from the lungs and another large proportion through the skin.

In the brief time I have at my command I can only suggest methods of meeting this demand of our nature for fresh air by means of ventilation and outdoor life, methods with which you are probably familiar.

At once we are confronted with the obstacle to perfectly ventilating a house. Economic considerations frequently lead householders to save fuel at the expense of health; again drafts from open windows are objectionable; also many persons accustom themselves to an overheated room and catch cold if fresh air is admitted while sitting at work. Science and invention are coming to our aid to overcome the first two objections, and the last can and will be overcome by the exercise of will power and the desire to be well. Public opinion is coming to favor open windows in sleeping apartments and the sleeping porch or tent has ceased to be a fad; the arrangements for absolute comfort of body while enjoying fresh, pure air for the lungs has been reduced to a science along these lines.

In this very important matter of fresh air as a necessity for physical health it has seemed that familiarity with the subject has bred indifference.

It is of vital importance to realize that we cannot consume too much pure air, the larger quantity the greater the amount of life giving oxygen conveyed to all parts of the body, and the larger the lung capacity, the better health and strength.—Dr. Ella S. Webb.

Important to Handicraft Workers.

The Canadian Handicrafts Guild, Montreal, is again offering prizes to the extent of several hundred dollars, for the best specimens of workmanship. To those skilled in weaving, dyeing, carving, book binding, metal work, sewing, leather work, basketry, knitting, rug making, pottery, there is an excellent opportunity afforded, not only to obtain a prize, but to find a sale for their work.

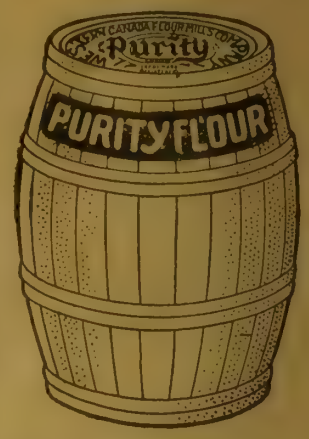
There is no entrance fee of any kind payable. Full detailed list may be obtained by sending a stamped self addressed envelope to the Secretary of the Guild, 586 St. Catherine Street, W. Montreal.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all Dealers.

Try the flour that holds the confidence of thousands of home-cooks

THE present huge demand for PURITY FLOUR shows the confidence in which it is held by thousands of home-cooks.

Those who have used PURITY FLOUR have come to believe in it. They look on PURITY as a friend. They feel they can trust it implicitly, because each and every lot of PURITY FLOUR has always been uniform—always up to the high standard of quality that has made it famous.



Wouldn't you, too, like to use a flour you could always rely on? Wouldn't you like to feel certain that your bread, cakes, and pies were going to turn out exactly right? That's just how you'll feel when you become a user of PURITY FLOUR — the confidence-creating flour.

PURITY FLOUR gives high-class results, because it *consists exclusively* of the *high-grade portions* of the best Western hard wheat.

On account of the *extra* strength of PURITY FLOUR please remember, when making pastry, to add *more* shortening than an ordinary flour requires.

PURITY FLOUR

"More bread and better bread"

And when making bread add *more* water, and PURITY FLOUR will expand into more loaves than the same weight of ordinary flour can produce, thus making *"more bread and better bread."*

Make your next flour order spell P-U-R-I-T-Y F-L-O-U-R.
It costs slightly more, but it's worth the difference.
Add PURITY FLOUR to grocery list right now.

Use and Value of Grains, Animal and Green Foods in Feeding Poultry.

A fowl requires grain food, vegetable food, meat food, and grit. These foods should be clean and wholesome, and furthermore a portion of them should be given in some form so as to induce the birds to take exercise, so that the fowls will be healthy. Fowls should be well supplied with water or milk to drink. Many make the serious mistake of not giving sufficient drink or not giving it regularly. The supply should be clean and constant. Dirty water, dirty or slimy drinking dishes, etc., will do more toward making a flock unhealthy and diseased than any thing else. Most attendants are inclined to forget to clean the drinking vessels, and to keep them well filled at all times.

Grains.—Wheat with the Ontario people is the most popular feed and is one of the best. It is relished by all classes of poultry. The price of wheat, as compared with that of other grains during the past few years, makes it necessary to mix other grains with it. I doubt very much if it is advisable at any time to feed only one kind of grain constantly, as a variety is better; some birds like one grain while others relish another.

Wheat bran is fed dry in hoppers, also in mashes. It has considerable feeding value. It helps materially in adding bulk to the ration, and prevents impaction in the stomach. In other words, it aids the digestive fluids in acting upon the food.

Middlings or shorts is of value in mashes, to all classes, and is one of the good foods to check looseness of the bowels, where an excess of vegetables is given.

Low-grade flour is often a cheap and economical food in mashes for stock birds or for fattening chickens. It also has a tendency to check looseness of the bowels.

Corn is not used so much in Ontario as in the New England States. There it appears to be used quite freely in both Summer and Winter feeding of fowls. It is used whole, ground and cracked, the meal being used principally in the mash foods. Cracked corn is used largely for young chicks, and fowls when scattered in the litter. The whole corn rather large and conspicuous; and when in the litter, does not usually give sufficient exercise. I am of the opinion that corn can be used in portions of Ontario, where it is grown extensively, much more freely than it has been heretofore. Corn is a heating and fattening food, and is, therefore, best adapted for Winter use. It is considered by many, when fed in large quantities, to make the hens over fat; yet it is used extensively by many progressive poultrymen with little or no evil effects.

Oats should be a first-class poultry food, but owing to the large percentage of hull, they are not relished by chickens when fed whole, and for this reason are somewhat indigestible. When rolled hull and all they are an ideal food as a dry mash, and are relished by fowls better than any other dry mash we have yet used. Ground oats without the hull are used extensively for fattening chickens.

Barley, either whole or ground, is very good. It has rather too much hull, but otherwise is a satisfactory food. It is considered by many to be next to wheat in point of value.

Buckwheat is very popular as an egg producer in districts where it is extensively grown. Some difficulty is at times experienced when first feeding it to fowls in getting them to eat it, but this is usually overcome in a day or so, if other feeds are withheld. Boiling the buckwheat will sometimes start the birds to eat it. After they once get accustomed to its appearance, it is much relished by them. Ground buckwheat is an excellent food to use in a fattening ration. It is somewhat like corn in its fattening properties and, therefore, it is better for Winter than for Summer use.

Method of Feeding the Winter Laying Stock at the O.A.C.—We try to simplify our methods and use only the common foods, and at the present time are using as whole grains, wheat, corn and buckwheat. These grains are fed in equal parts both morning and evening. The morning feed is fed the previous evening after the hens have gone to roost, by sowing it on the litter, and then turning the litter over; the straw is now on top and the grain below, and when the hens get up in the morning, they start to dig out the grain, and are kept busy all forenoon. At noon we feed mangels, cabbage or clover hay. The night feed consists of the whole grain fed in troughs, and what the birds do not eat is taken up. Rolled oats are kept constantly before the hens in hoppers. Buttermilk only is given as drink.

Method of Feeding the Summer Laying Stock at the O.A.C.—At the present time our plan of feeding is to scatter whole grain in the litter both morning and evening. The grains used are wheat, barley, oats,

FARMING

has become a specialized business

It's no longer a "hit-or-miss" occupation, where "any old way" is good enough. Farmers are buying pianos and automobiles as never before. They're ***living*** as well as ***working.***

The farmer has learned that it ***pays*** to employ progressive methods. That's why he is ever ready to receive helpful suggestions for improving his crops, his land and his home. It's also the reason that more than fifty thousand Canadian farmers are enthusiastic about our handsome book:

"What the Farmer Can Do With Concrete."

It isn't a catalogue, nor an argument for you to buy something. It is clearly written, interesting, profusely illustrated. It describes the various uses to which concrete can be put on the farm. Not theories, but facts, based on the ***actual experience*** of farmers all over the continent. It is the most complete book on the subject ever published, fulfilling the purpose behind it, which is to help the farmer take advantage of concrete's possibilities. The list of subjects covers every conceivable use for concrete on the farm. The book's actual value to you will far exceed the list price of fifty cents, but if you will send us your name and address at once, we'll be glad to

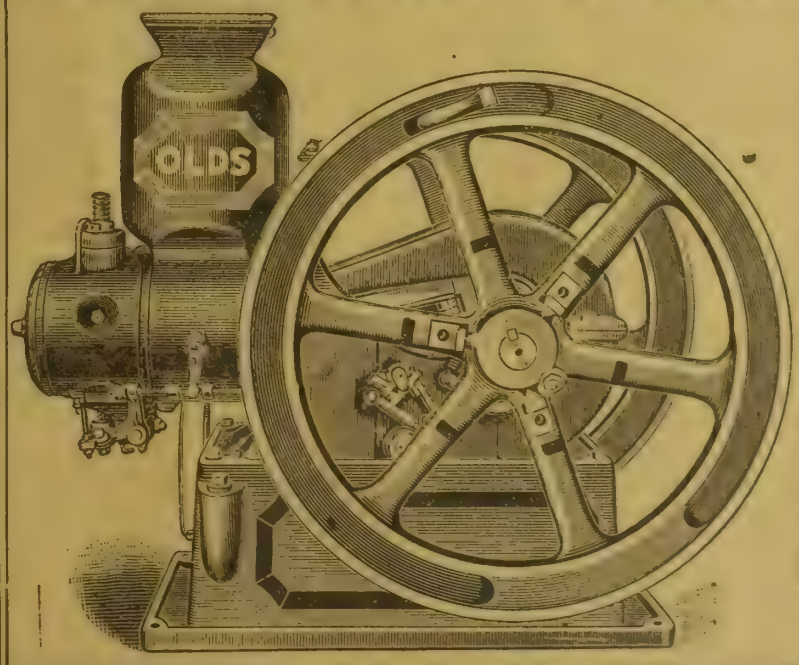
Send It To You Absolutely Free.

Send a post card for it—do it to-day. The book will be sent by return mail.

CANADA CEMENT COMPANY, Limited

National Bank Building, MONTREAL.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

and occasionally buckwheat and corn. Green food is supplied in the form of grass, etc., in the runs. Sour milk is given as drink.

Dry Feeding.—The tendency at the present time is to feed dry grain, and to use no wet mash foods. It has been claimed by some writers that mash foods, while tending to force growth, and possibly egg production, do not tend to produce good eggs for hatching purposes; that is to say, the mash is more or less of a forcing food. In the production of eggs, the number produced is probably as large if not larger where mashes are used, but the hatching power of eggs in some instances is not as high. During the past two or three years we nave not fed any wet mashes 'to our breeding birds, and have fed in place some sprouted grain, but mostly rolled oats in hoppers. As far as we can see at the present time the sprouting does not improve the feeding qualities of grain very much, with the one exception of oats. The palatability of oats is increased considerably. We have made the oats equally palatable by having them rolled or flattened, that is the hull and all.

Feeding When Wet Mashes Are Used.—The general method of feeding is to give a mash of mixed ground grains moistened with water or milk, in the morning; a little whole grain scattered in the straw covering the floor, at noon; and all the whole grain they will eat at night. This latter meal is usually fed in the straw. Some poultry men adopt the plan of not feeding the mash until evening, we have been practising this plan for some time, and we like it very well. The objection to the former plan is that the hen is likely to become gorged with food early in the morning, and thus take to the roost for the rest of the day, which is usually followed by hens becoming too fat, and the egg record becoming small; but, notwithstanding, many successful poultrymen use this method to advantage. The objection to feeding the mash at night is that it becomes quickly digested, and the bird has not sufficient food to last it during the long Winter night; but this objection can be overcome by giving a little whole grain after the mash at night.

Some poultrymen feed their fowls but twice a day, morning and evening, and get very good results; but I favor feeding three times a day. Our plan is somewhat as follows:—

Early in the morning the fowls are given half a handful each of whole grain. This is buried in the litter on the floor. Thus the fowls get exercise (a very necessary thing) in searching for it and at the same time keep themselves warm. At noon about two handsful of grain are given to a dozen hens in the litter; they are also given all the roots they will eat, either pulped or whole, as fowl relish mangels, sugar beets and turnips. Cabbage also—a very good green food—is sometimes given. About four o'clock in the afternoon they are fed a mash composed of equal parts of bran, shorts, oat-chop and corn meal (during cold weather); and to this added about 10 per cent. of animal meal, if we have not cut green bone or cooked meat. These foods are thoroughly mixed together in the dry state, after which is added steeped clover, which has been prepared by getting a bucket of clover leaves, or cut clover hay, and scalding it with boiling water. This is done early in the morning, and the bucket is kept covered with a thick sack throughout the day. This will be quite warm at night, if it has been kept in a warm place. There is usually sufficient liquid to moisten the meal that has been mixed. Our aim is to have about one.third of the ration, in bulk, of clover. After the mash a small amount of whole grain is fed in the straw. There is—and should be—a plentiful supply of good, pure water within easy reach at all times.

To those who keep but a dozen or so fowls, or to those who wish to economize in the feed bills, by using table refuse such as bread, meat. vegetables, etc., the wet mash system is commendable in that these cheap by-products, if clean, and cooked, make excellent mashes, when dried off with shorts and bran or other chop. This kind of mash usually gives excellent egg yields, and the labor entailed is not a serious consideration, under the above conditions, but it is, at times, where birds are kept in large numbers.

Animal Foods for Fowls. — The most expensive foods given to fowls are the animal foods. These are used as a substitute for the worms and insects that form a portion of the natural Summer food of fowls upon free range. Flocks confined to small runs require to be fed more or less animal foods during the Winter, and during very long dry spells in the Summer; even where the range is unlimited it frequently pays to feed a little animal food.

Animal foods usually assist very materially in the production of eggs in Winter. By some people these foods are considered as a forcing food, that is to say, they will induce heavy laying, which in some instances may be followed by serious sickness, or possibly the injury may be only very slight; in fact, unnoticeable, except that the eggs from birds so fed may be of very low hatching power.

It is generally believed, and I think rightly so, that good egg yields cannot annually be secured without the use of such foods as green cut bone, beef scraps, or cooked refuse meat, etc. Many believe that the larger the amount of these foods fed the greater will be the egg production. There is good ground for doubting this statement, in that these foods are expensive, and the extra eggs may cost more than they are worth, moreover, herein is where serious injury may be done to the hen's digestive and reproductive organs.

Milk is available on many farms, and it is claimed that as an egg producer, this food is equal in value to any of the meat foods. Our experience has been that sour milk for fowls has a slightly greater value than sweet milk, and is certainly much more easily obtained.

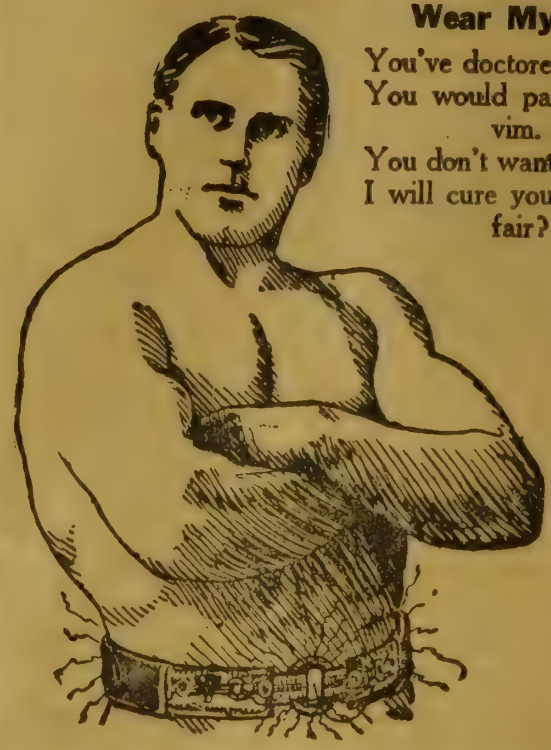
Green Foods.—When fowls have free range, they eat a considerable amount of grass, or other green foods. It would appear, therefore, to be desirable that where birds are confined either in small runs during the Summer, or in houses when the ground is covered with snow in Winter, that some effort should be made to supply this food.

Many foods are available, such as waste cabbage, mangels, turnips, rape clover hay, or clover leaves, and green food grown especially for the purpose.

Early in the fall we use cabbage or rape; or at times where the runs have been sown to Fall rye or wheat, the fowls are allowed to feed upon these. Where rape is extensively fed it frequently will cause the whites of the eggs to have greenish cast, which renders them unmarketable. This food is relished by the fowls, but must be fed carefully. Cabbage

MEN, HERE'S AN OFFER

Wear My Electric Belt Free Until I Cure You



You've doctored and doped till you are sick of it all.
You would pay for anything that would give you back your old vim.
You don't want to pay out any more money till you are sure.
I will cure you first, and you can pay me afterwards. Is that fair? Then get in line.

I know what I can do, because I've done it and am doing it every day. I'm sure that Electricity is the life and that I can restore it where it's lost. So if you need what I offer, and don't want to risk my price, wear my Belt free until you are cured, then you can pay me.

And when you do pay me the cost is less than a short session of drugging, and how much more pleasant! You put my Belt on when you go to bed; you feel the soothing, exhilarating vigor flowing into your weak body, and while you sleep peacefully it fills you full of the fire of life. You wake up in the morning feeling like a giant.

Now, I can't cure everything. I don't claim to, and I won't take a case that I don't feel sure of, but all these troubles which come from an early waste of vitality, from dissipation of any kind from decay of nerve power, or from any organic stomach, liver or kidney weakness, I can cure, and those are the cases I am willing to tackle and take the chances on. I am curing them every day.

All I ask is reasonable security for my Belt while you are wearing it.

Dear Sir,—I wish to say that your Belt has given me good satisfaction. I might say further that I think mine was a hard case to help, being troubled with sick headache and very bad pains in my head and not able to sleep more than half the night. I am pleased to say that after wearing your Belt for awhile I slept better and my sick spells grew longer between. The current generated by the battery was fine and soothing and gave me good satisfaction in a great many ways. I remain, as ever,

A. S. MACE, J.P., Newton, Kings Co., N.B.

Dear Sir,—I write to let you know that I am highly pleased with the work your Belt has done for me. It has done what no medicine would do. For years I have had to take medicine every night for constipation, and now your Belt has completely cured that trouble; also dyspepsia. I cannot thank you too highly for what you have done for me. I am recommending your Belt to all troubled with similar ailments, and no doubt you will hear from some of them soon.

J. ALLAN,
North Nation Mills, Que.

Tell me where you are and I'll give you the name of a man in your own town that I've cured. I've got cures in every town.

That's enough. You need the cure. I've got it. You want it. I'll give it to you or you need not pay me a cent. Come and get it now. The pleasureable moments of this life are too few. So don't throw any away. While there is a chance to be husky and strong, to throw out your chest and look at yourself in the glass and say, "I'm a man," do it and don't waste time thinking about it.

I've got a beautiful book, full of good honest talk about how men are made big and noble, and I'll send it to you free, sealed, if you send this coupon.

CALL TO-DAY

If you can't call, send Coupon for Free Book.

M. K McLAUGHLIN, 214 St. James St., Montreal, Can.
Dear Sir,—Please forward me one of your booklets as advertised.

Office hours—9 a.m. to 6 p.m.; Wednesday and Saturday until 8.30 p.m.

at times will flavor the eggs slightly, and if frozen may cause serious digestive troubles. Both rape and cabbage make good green foods, but good judgment must be exercised in their use.

Mangels are a very succulent food and are relished by the birds during the Winter. They can be fed either pulped or whole. When they are fed whole, we usually stick them on a projecting nail, at a convenient height, upon the wall of the pen. When these are fed freely they frequently scour the fowls. For this reason during some seasons we are obliged to feed them not more than twice a week.

Turnips may flavor the eggs. They are not as palatable as mangels, in fact some birds will not eat them at all, but at the same time they have considerable food value.

Clover leaves, either, steamed or dry, are relished very much, and upon the whole are the most reliable Winter green food. One hundred hens will eat from a peck to a bushel of clover leaves daily. This food upon the farms is cheap and easily procured, and should be fed more than it is.

The growing of green food is becoming quite popular with many, but we have never received sufficient results to warrant our growing it extensively, except for little chicks.

The ordinary plan is to soak the grain—most people use oats—twenty-four hours previous to sowing. The ordinary greenhouse flat is useful for this purpose. Any box from 3 to 4 inches deep will answer. It is necessary that the bottom of the box should have sufficient holes to give good drainage. Place a little damp earth over the bottom of the box, and then put in about 1-2 inch of soaked grain, and cover this with about 1 inch of sand. Keep the box in a warm place, and keep the earth moist. In a few days the grain will begin to germinate. Most feeders allow the grain to grow two or three inches before feeding—Extracts from a bulletin issued by the Ontario Agricultural College.

Repairing Bee Hives.

With the long nights on hand the enthusiastic bee-keeper at all handy with tools may profitably occupy some of his spare time in the useful work of doing needed repairs to any faulty, disused hives, or portions of the same that may chance to be on hand. Bees should never be wintered in a faulty hive, or there is grave risk of entirely losing the stock. Such hives should be stored under cover when put out of commission, and will be then quite dry by this, or if not taken in some time ago should be now sheltered and well dried before taken in hand for repairs. Wood swells when damp, and if repaired when so distended there may be subsequently cracks between joins, that are not at all desirable, to say the least.

Similarly, too, wood intended to be used in the repairing of hives should be dry, and well seasoned. For the repairing of hives any sound wood may be pressed into service, so long as it is of even grain and free from knots. A good wood is red deal and it is one generally obtainable without difficulty; but the best plan, when feasible, is to ascertain of what wood the hives are constructed, and then use wood of similar variety. Good hive wood is often to be met with in packing cases, procurable for a trifling sum. The wood should be a little thicker than actual requirement, to allow for working down, and should not be too thick, or too much planing becomes necessary. Most handy men have the necessary tools on hand, the chief required being a tenon saw, a smooth plane, a rule, a square, hammer, suitable nails, a bradawl, and a chisel or two. The sharper the edged tools the better, for neat work cannot be done with blunt tools. The first step towards the repairing of a hive is to examine it and note exactly what is required to make it sound again. Then if any dirt be upon the hive it should be thoroughly removed by scrubbing with soap and hot water if necessary, after which the repairing may begin. An unsound piece of wood should be removed bodily, if possible, and then used as a pattern from which to fashion a new piece of sound wood to take its place. If such removal cannot well be done, the faulty portion should be removed by means of saw and chisel, and a new patch be prepared from measurement alone. In this case particular care should be taken that the measurements are exact, for with some portions of a hive faulty measurement will handicap the subsequent handling of the bees.

When dressing up the wood for a particular portion of the hive all exposed surface should be made smooth. First the plane should be used, dressing to the desired thickness; then should come fairly coarse emery paper, finishing off with a fine grade. If an outer surface, it may be rubbed over with a little raw linseed oil, but not until fixed in place. Before finally securing a "mend" see that it needs no further shaping. It is usual to nail in position, either with nails or brads, but thin screws make still better work in amateur hands. Secure firmly, for if lightly attached dry weather may cause the wood to spring. When repairing lifts, see that when finished they will fit, not only the hive, but also over one another, whichever may be uppermost. With roofs, let the eaves well overhang, and be sure that they are watertight. If any doubt exists, cover with flat galvanised sheeting. When all the repairs needed to the hive have been done the new portions of the woodwork should be given a priming coat of thin oil paint. When this coating has dried thoroughly the whole hive should be carefully painted with oil paint of medium thickness, and when this has dried another coat should be given as a finish, which should make the hive look like a new one. As to the best colour of paint to use, it is to a great extent a matter of opinion, though for the resisting of the summer's sun a light, rather than a dark, shade should be chosen. If artistic effect is desired the hives may be picked out with some lively colour. The painting of each hive a different colour, so that the bees can readily find their homes, is beneficial in theory only.—J. T. Bird.

Editor Maritime Farmer:

We believe it would be of general interest to your readers if you would kindly point out that the notice—"Send coupon for calendar," which has appeared in many of our advertisements latterly has unfortunately led to a misunderstanding and consequent disappointment to many of the readers of these advertisements. The Sales Dept. of this Company is in receipt of a large number of letters containing the advertisement in question cut out of the paper in which it appeared; together with the request that we forward a calendar. The advertisement itself is not the coupon referred to. This is found only in the globe of the Banner Lantern and the calendars are forwarded on receipt of this coupon. This is in the form of a post card addressed to the Company with a space for the name and address of the sender and the dealer from whom the Lantern was purchased.

We would be glad if you will kindly find space for these remarks in your next issue, and oblige Ontario Lantern & Lamp Co., Ltd., Hamilton, Ont.

When a Cold Begins

get after it quickly. Don't let it drag along. Start at once to take Na-Dru-Co Syrup of Linseed, Licorice and Chlorodyne, and prevent the cough from getting hold of you.

NA-DRU-CO Syrup of Linseed, Licorice and Chlorodyne

breaks up the cold, soothes the irritation in the lining of the air passages, and loosens the phlegm so that the cough never gets to the dry, hacking stage.

NA-DRU-CO N D & C Co TRADE MARK

FOR EVERY AILMENT THERE'S A NA-DRU-CO SPECIFIC BEARING THIS TRADE MARK. SEE THAT YOU GET IT.

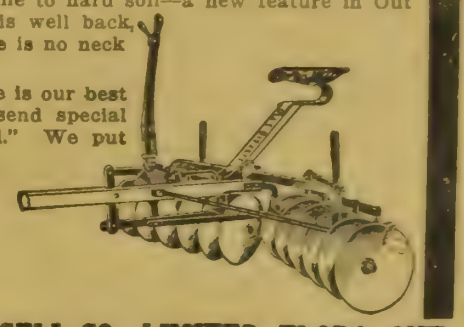
Na-Dru-Co Syrup of Linseed, Licorice and Chlorodyne is an absolutely safe household cough-and-cold remedy, compounded by expert chemists. Your Druggist will confirm our statement that you can give it to the little tots without any risk. It is put up in 25c. and 50c. bottles. 113

National Drug and Chemical Co. of Canada, Limited

The "BISSELL" out-throw DISK HARROW

To settle all doubt about which is the BEST OUT-THROW DISK HARROW, we ask you to test the "Bissell" Out Throw in a field competition with other Out Throw Harrows.

The "Bissell" Out Throw has many features that have made the name "Bissell" famous in connection with Disk Harrows. It has plates of the correct shape. One gang is set slightly ahead of the other. The gangs cannot crowd or bump together and cause the Harrow to rock when you come to hard soil—a new feature in Out Throw Harrows. The hitch is well back, the draught is light and there is no neck weight.



The machine in actual use is our best advertisement. No need to send special travellers to sell the "Bissell." We put our name on every Harrow. If you would like to learn more about Disc Harrows, send to Dept M for free booklet of both out-throw and in-throw styles. 58

T. E. BISSELL CO., LIMITED, ELORA, ONT.

FREE TO YOU—MY SISTER FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell all women about this cure — you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhoea or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a **complete 10 days' treatment** entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treament for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost** my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhoea, Green Sickness and Painful or Irregular Menstruation in young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

MRS. M. SUMMERS, BOX H 309 - - WINDSOR, ONT.

Some Common Defects in Crop Raising Methods in the Maritime Provinces.

(Continued from page 219).

profitable to use a little care to obtain the best results from our field crops. The seed plot may be of any size, from one to five acres, according to requirements, but preferably not too large as with the best of care it will require a certain amount of rogueing or picking in order to keep it free from other kinds and other varieties of grain that are bound to crop in.

The plot should be well drained, well cultivated and if possible the earliest to be sown on the farm in order to have it perfectly matured and harvested while the harvest season is at its best. Any person who has seen grain cut at different stages of maturity tested, side by side, would easily recognise the well matured seed by its strong, vigorous growth. The meat or kernel of the grain is simply the food stored up by the mother plant until it is able to take care of itself, and the young plant produced from an immature seed has about the same chance as a young animal dropped by a dam which is not capable of producing enough milk for its nourishment. It is scarcely possible for the farmer with even a moderate acreage of grain, to allow it all to ripen perfectly owing to loss from storms, shelling, etc., yet the special seed plot should be thus handled with little or no loss. It has been proven by many experiments that sowing of imperfectly matured grain year by year causes it to deteriorate and lose its good producing qualities. One of the greatest evils we have to contend with in the producing of pure seed grain is the multiplication of varieties, and unnecessarily so. By a little experimenting on the part of the farmer one variety will be found to be a better producer on his farm than any other, then why not all of the best? In it will be found that one certain variety is best adapted to whole districts—then why use any other. I have in mind one section in P. E. I. that is producing almost exclusively Banner Oats, and it would not be difficult at the present time to procure in that district several thousand bushels of comparatively pure seed. Neither is it so difficult for the farmers in that section to maintain their seed in its purity.

Another defect in production of our Field Crops is lack of treatment for Smut, especially for oats. We have not in the past perhaps suffered from this disease so much as other parts of Canada. But we find it increasing rapidly and in some instances taking a heavy toll from our fields. Ten percent which is not unusual means just about 10 percent shortage in our yields. The plant producing smut started to produce grain and occupied about as much space as though it did. The man who uses his own threshing mill will not need to treat for smut annually; but the man who uses the public mill will safeguard his crop by treating his grain every year.—An address by S. J. Moore, Maritime Representative, Seed Division, Ottawa, before the Maritime section of the Canadian Seed Growers' Association, at Amherst.

Care of the Horse in Winter.

Sharp shoes are the urgent need of the day. It seems incredible that a man should expect a smooth-shod horse to haul a load over slippery roads, but there are any number to be seen daily. In winter every horse in service needs special attention. He who owns or drives horses should put into use every bit of his practical and theoretical knowledge of horses, especially in this slippery weather. After a horse has made several frantic efforts to start, and has satisfied himself that it is useless to try, it is often hard to get him to make another attempt, even after applying something to aid him to get a foothold. No amount of yelling or lashing will do any good, and such a scene is a sad spectacle. Let him rest a moment, talking quietly to him, and then go to his bridle and shift this as if readjusting it. Then hold up his front foot a short time, and the horse will have forgotten his fear in wondering what you are doing to him. Then take hold of his bridle, and, with a few calm, reassuring words from you, he will start off.

It is often impossible for a team unassisted to start a wagon on a sharp grade. When the horses exert all their strength to start the load the driver should use all his common sense to help them. It may be necessary, after arranging for a foothold, for the driver to put his shoulder to the wheel. Passers-by may help him, and with one man at the horses' heads and two more at the wheels the thing is done quickly and happily.

The horse's feet should be watched for signs of cracked heel or scratches during cold, muddy weather. If he stands in mud and water that freezes on his feet it is liable to cause grave trouble. A good preventive is to rub the hollow above the hoof thoroughly with vaseline before starting out on such days. Never wash the mud off the legs and feet upon coming in at night, simply wipe off thoroughly with a dry cloth, and then, if possible, bandage. The next day brush out dried mud and apply vaseline.

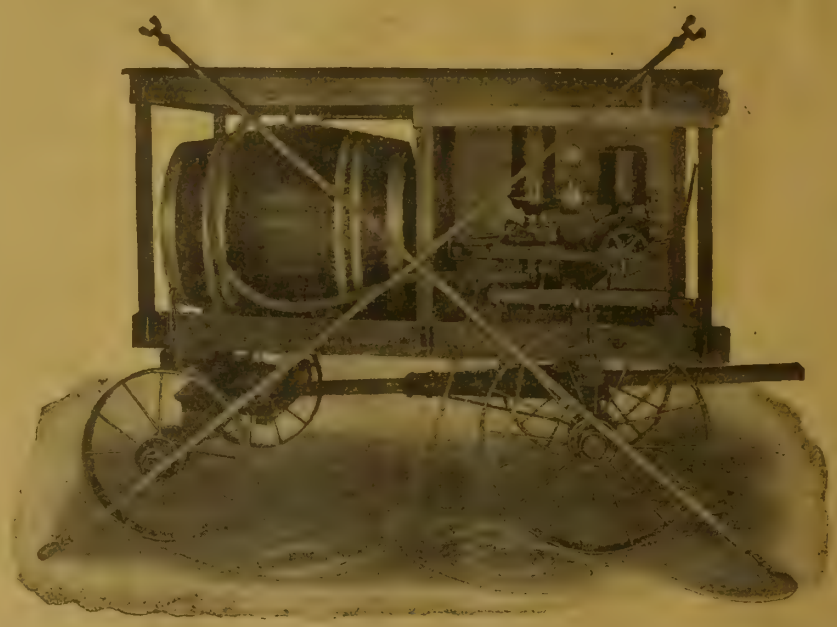
See that the rug is securely fastened when you leave your charge standing in the cold. A rug that only touches the horse where it is fastened around the neck and leaves the rest to the caprice of the wind, is enough to frighten any horse. No teamster with feeling or self-respect will leave his charge uncovered. The few seconds gained in throwing harness on in a careless, slip-shod manner often means many hours lost in the detrimental effects upon the horse. How would you like to do a hard day's work with the armholes of your coat so tight that they cut into the flesh with every move? Think of this when harnessing your horse, and adjust your harness accordingly. It is almost unbelievable that a man could put a harness on a horse day after day without readjusting, when the evidence against that harness was gradually working itself into a sore. Think of how this galling lessens the working capacity of the horse. During slippery weather, especially, see that your wagon is in good condition and pulling as lightly as possible. Look to it that the wheels are on tight and axles well greased. Don't wait to have the wagon tell you at some critical moment that it needs attention.

Bone in Horses.

What is the peculiar attribute to which the horse-buyer attaches importance when he speaks of an animal having good bone? It is to be feared that in many cases what is in his mind is size or quantity of bone. But far more important than size and quantity is quality, and it is well that those who are interested in horses should make a note of this. If the bones of two animals, such as the thoroughbred and the cart-horse, be examined, a great difference will be noted as regards their density, the bones of the racer or thoroughbred being very much less bulky, but far more compact and less loose and spongy than those of the slow-moving draught-horse, such as the Shire or Shire cross. Other things being equal, says a well-known veterinary surgeon and writer, the more porous the bones the more liable they are to bony deposits, such as splint, spavin, and ringbone. The truth of this will be apparent to all who have to do with the treatment of any of these diseases. It is quality of texture, not bulk of texture, that is required.

The difficulty which arises is how to judge quality of bone. Like most things, it must depend to a great extent on the teaching of experience, but a useful hint is given by the veterinary surgeon referred to when he says that when judging an animal, the history of which is unknown to us, or whose work has not been sufficient to test the soundness of his legs, if he is found to have weak, flat hoofs, it would probably in the majority of cases be accurate to conclude that the bone is of inferior

"Simplicity" Power Sprayer



If you want satisfaction in a Power Spraying outfit buy a "Simplicity." It is compact, simple and the most durable machine on the market.

Not Better than the Best, But Better than the Rest.

Also a complete line of Hand Sprayers and Parts.

Farmers' Sons Wanted

With a common education to take a short course at the

G. T. P. School of Telegraphy and Railroading

During 1911 we have placed all our Graduates in good paying positions and among the number was a young man from Kent County who got **A Good Position**

Mr. Oswald R. McAuley, of Main River, Kent County, attended this School five (5) months when he was selected and recommended, by THIS SCHOOL'S Employment Department, to fill the position as Assistant Agent and Operator, at Wynyard Station, Sask., on the Canadian Pacific Railway. The Grand Trunk Pacific will need a large number of Telegraph Operators, early next summer. Prepare this winter and remember, what we have done for him, WE can do for YOU. Our Winter Term begins Tuesday, Jan. 23rd, 1912. Up-to-date equipment. Residential School. Positions secured for Graduates. Write for Free Catalog, Rates and full particulars to

W. T. LITTLE, Principal, - - - - - Fredericton, N. B.

quality. Let it be remembered that the nature of the soil, of the food, and of the climate generally very considerably affects the feet and bones of an animal. Horses in low-lying, moist districts are found to have weak and flat feet, whereas in firm ground and hilly districts their feet are more upright and blocky. The main thing, however, which should form the basis of the purchaser's judgment is that it is quality and not quantity of bone that counts, and that the animal with large, round, bulky bone may be but a poor specimen after all.

Hygiene of the Horse's Hoof.

The colt in the yard or at pasture should have its feet cared for as closely as the matured animal, in order that he may grow to maturity with feet in a healthy condition. The foot of the colt grows so rapidly that the wall will often project far below the sole and cause it to split and form quarter and toe cracks It is better to use a pair of hoof cutters and rasp, and have the feet pared evenly and avoid unbalancing the animal.

Any horse used on the road should be shod, but the shoes ought to be changed every five or six weeks and the feet trimmed in order that the natural growth of the wall may be removed. If the shoes are improperly allowed to remain on the feet for two, three or four months, without changing them, the wall becomes excessively long and grows over the shoe. Pressure becomes too great on the sole and bars, resulting in corns, bruised soles and lameness.

A hoof hook should be included among the equipment of a well-regulated stable. The feet of the horse should be cleaned every morning before he leaves the stable. The hoof hook will remove all litter, pebbles, or anything that may have become lodged in the foot. This precaution may prevent injury to the sole or sensitive structures of the foot. If the feet become very dry, pack them daily for a week with some form of clay. Then apply lard to the wall, to which may be added pine tar and rosin. This ointment holds the moisture in the feet and prevents further evaporation.

Use and Abuse of Horse Blankets.

There are horse blankets and horse blankets, all classes of horses and every kind of weather and condition in which to use them, but so often are horses forced to suffer through their use, or rather misuse, in many cases, they would be better without them. Yet, the blanket used along with good horse sense, is invaluable in keeping the working horse in good condition during the winter.

The common practice of blanketing horses along in the fall, when their winter coat begins to come in, to keep the animal looking "fine," is a source of, to say the least, discomfort to the animal; to keep a horse in a warm stable, heavily blanketed, and then work him throughout the day, without this "wrap," shows lack of judgment. No doubt a sleek coat can be maintained in this way, but it is rather hard on the horse. The use of heavy blankets under normal conditions cannot be condemned too much. Their place is for use in severe weather, where horses have to stand outside or in open sheds during the winter. For stable use, a light sheet only should be used. Even during fall months, the horse, unless very hot, should receive only a light covering.

The heavy blanket, while it is invaluable to protect the horse in certain conditions, and should always be in a handy place on the farm ready for use, can be greatly abused, and indiscriminate use can cause the horse as much or more discomfort than if it were taken away entirely. Blanket the horse for protection, and not for show.—Farmers' Advocate and Home Journal, Winnipeg.

Methods for Pickling Pork.

Pork may be pickled by using for each 80 pounds of meat one pound salt, four pounds sugar, one quart molasses, and three ounces saltpeter. The meat is well rubbed with salt and left in a pickle barrel for 15 days draining off the fluid from time to time.

A second method is to use one bushel of fine salt, two pounds brown sugar and one pound saltpeter, which would be enough for 800 pounds of meat. The sugar improves the flavor of the meat, and the saltpeter makes the pork firmer. After a few days a little more of the salt mixture may be applied, rubbing it in if absorption is going slowly. All cut ends of bone must be thoroughly salted in, as decomposition is most likely to occur in such places. This method may be used where hams, shoulders and bacon sides are packed together in the same barrel, the hams being packed at the top of the barrel to prevent them from becoming too salty.

Resalting should take place within 10 days or two weeks, according to the weather. After four to six weeks the meat may be unpacked, washed and smoked, or the salt may be left on the meat during the process of smoking. Before hanging in the smokehouse the meat may be sprinkled with black pepper or a mixture of black and red pepper. A molasses barrel is better than a whisky barrel, but if a whisky barrel is used, the interior should be charred first. This will remove the flavor of the whisky.

Infertile Eggs Keep Best.

A large part of the heavy loss from bad eggs can be obviated by the production of infertile eggs. This has been demonstrated beyond a doubt by the investigations concerning the improvement of the farm egg which during the past two years have been conducted in the Middle West by the bureau of animal industry of the Department of Agriculture.

Secretary Wilson of the U. S. Department of Agriculture estimates that between the producer and the consumer there is an annual loss of $45,000,000 in the egg crop of the United States, the greater portion of which falls on the farmer, who is by far the largest producer. Of this enormous loss, about one-third, or $15,000,000,is caused by heat which develops the embryo of the fertile eggs, causing what is known to the trade as a "blood ring." As it is impossible to produce a "blood ring" in an infertile egg, such an egg will stand a higher degree of temperature without serious deterioration than will a fertile egg.

The secretary says that if farmers and others engaged in the production of eggs would market their male birds as soon as the hatching season is over, a large saving would be made,as practically every infertile egg would grade a first or second if clean and promptly marketed.

No more simple or efficient method for the improvement of the egg supply of the country could be adopted than the production of infertile eggs.

Wood Ashes as a Fertilizer.

Ever acre of the 20,000 square miles of cultivated land in Japan annually rceives 38.6lb. of potash and 12.8lb. of phosphoric acid, derived from ashes, eight-tenths of which is from wood ashes, contributed, according to the investigations of the late Professor F. H. King, by the non-arable hills and mountains of that country. More than 1,693,000 sons of wood ashes are annually spread upon the arable soils of Japan, a fertility tribute exacted by these pains-taking Oriental farmers from lands that are otherwise unsuitable for the production of crops.

Ashes owe their principal agricultural value to the lime carbonate and potash that they contain. Twenty-four samples of wood ashes analysed by the Connecticut Station in 1908 showed the following average composition :—Total potash, 4.62 per cent.; water-soluble potash, 3.77; lime, 26.47; magnesia, 2.46; phosphoric acid, 1.48; inert material, sand, 13.54; coal, 2.94. The prospective purchaser af ashes should assnre himself that the proportion of inert matter is as low as possible. Admixture with coal ashes raises the amount of inert material and lowers by exactly that proportion the value of the wood ashes.

The source of ash affects its composition. Hardwood ashes are more highly prized than those from soft wood. The latter are probably as valuable, pound for pound, as are the former, but yield a very much smaller amount of ash a cord. Deciduous trees generally yield more ash and one higher in potash than do the conifers. Because of their potash content, wood ashes may be expected to produce good results on peat and muck soils, which are normally deficient in that element. In 1907 the Wisconsin Station found that wood ashes produced a note-worthy increase —amounting to 1½ tons an acre—in the yield of potatoes on a peat soil in the northern part of the State.—Country Gentleman.

Carry a warm blanket with you every time you drive away from the farm. You may intend to come right home without hitching, but one can never foresee the delay that may compel you to hitch your horse in the open.

Many a horse is made to wrench and lame himself by sudden reining Every driver needs to think how rapidly changing direction may affect a driving horse, and aim to make no quick turns.

In order that a good horse may result the colt should not only be given a good start in life, but should be kept in healthful and thrifty condition through the growing stage.

Touch your tongue to a piece of iron on a frosty morning. Thereafter you'll remember not to put into a horse's mouth a frosty bit until you have warmed it.

PEERLESS-PERFECTION

MEANS FENCE PROTECTION

Peerless Wire Fence does not serve only as a mere boundary line for your farm and pastures but gives real fence service as a permanent barrier to trespassing and wandering of stock.

You Should Fence Your Land With PEERLESS

We use high grade fence wire well galvanized. The joints are united by the non-slippable Peerless Lock, making a fence that will stand up against the most severe and sudden shocks without damage. The horizontal wires are all crimped, making ample protection for contraction and expansion, keeping the fence always tight even under extreme variations of temperature.

Write for our Illustrated Booklet at Once

We also manufacture a wonderful line of poultry fencing and farm gates. Agencies almost everywhere. Agents wanted in all unassigned territory.

The Banwell Hoxie Wire Fence Co., Ltd.
Winnipeg, Man., , Hamilton, Ont.

HAND SPRAMOTORS.

No. 1 and 2, with horse-drawn cart, can be used on orchards. vines, row crops or weeds. As shown here it is arranged for row crops and weeds, but separate attachments adapt it to other uses.

Adjustable width of track and rows, all-brass Spramotor, brass ball valves, automatic agitator and compensating plunger. High grade throughout. For one horse only.

Price $47 to $54

Awarded Two Gold Medals at National Horticultural Congress
W. C. HEARD, 1381 King St., LONDON, CAN.

ARNOTT INSTITUTE

The work of the ARNOTT INSTITUTE in treating Stammerers and Stutterers is becoming more and more widely recognized as perhaps the most successful on this continent.

Following our own scientific methods, the Institute treats the CAUSE of stammering —not the habit itself. It teaches the patient why he stammers and in the majority of cases that, it is comparatively easy for him to learn to speak fluently and naturally without any of the [illegible] commonly taught. As he knows why he is speaking correctly, the cure is permanent.

If you know anyone who stammers or stutters [illegible] them advise them to consult the ARNOTT INSTITUTE.

BERLIN, ONTARIO, CAN.

Proud He's a Farmer.

There used to be a time when to say of a man that he "looked like a farmer" was not taken with good grace by a lot of "smart" city people. But that was mostly when the farmers were doing not much but making slaves of themselves for city folk.

Now when we meet people in automobiles in the country, or at the great live stock shows and fairs, you can't be sure at all as to which are the bankers or merchants and which the stock farmers.

Agricultural education is so widespread, and knowledge of better ways of doing things so common in all parts of the country, that the farmers are rapidly coming to be "the people."

One day this week, A. G. Bridgeford, a banker, of Aledo, Ill., was at the Chicago yards and was introduced as being, as he is, a man of affairs in the financial world. He promptly said that he would rather be introduced as a farmer, and that he was prepared to prove his right to that dignified and desirable title. He showed an account sale of a good lot of cattle of his own feeding that had averaged 1270 lbs. and sold at $7.70. Inasmuch as these cattle cost him $4.75 a little more than three months ago, when he put them on feed, it was easy to see why he was proud to be recognized as a farmer.

Of course there are plenty of slipshod farmers, just as there are plenty of slipshod city people—only there are ten times as many of the latter as the former—but it is getting increasingly harder to tell by dress or culture or taste, or any other test, the best farmers from the best captains of industry in any other good calling.—Chicago Live Stock World.

Cleanliness in Milk Production and Treatment.

At every dairy farm, for whatever purpose the milk is produced, it is essential that cleanliness should be adopted in the cowhouse, as well as in the dairy itself. Dirty cowhouses are, in many cases, the source of milk becoming contaminated with obnoxious organisms and objectionable taints.

On the milk-selling farm, unless the milk has been produced in a cleanly manner, it will have bad keeping properties, and, perhaps, the flavour also will be noticeably tainted. Where tainted milk is converted into butter or cheese a taint in the milk is generally noticeable in the products. Taints in milk are of two kinds, one of which is due to the action of bacteria in the milk; the other due to the milk absorbing some odour. Milk especially when warm, readily absorbs any odour prevalent in the air; hence the absolute necessity for keeping the air of the shippon and dairy as pure as possible. In order to ascertain whether a taint in milk is due to bacteria or not, a sample of the contaminated milk should be placed in a clean vessel gnd kept warm for two or three hours. At the end of that period a bacteria taint in the milk would have increased, while a taint due solely to the milk absorbing some odour would not increase when kept warm, if the air of the room was pure. Taints in milk may be overcome to some extent by pasteurising the milk. At most creameries the milk or cream is all pasteurised before being made into butter, and the cream ripened with some pure culture starter previous to being churned. Where milk is produced expressly for the manufacture of cheese, every care should be exercised to obtain clean milk. The only way to overcome a slight taint in milk intended to be made into cheese is to add a fairly large percentage of starter, and then there is always the risk of too much acid developing, which would detract from the quality of the finished article. Any attempt to heat milk to a sufficiently high temperature to destroy the obnoxious organisms therein would totally unfit it for cheese-making. It is quite impossible under ordinary conditions to obtain milk free from bacteria, because the air is full of them; but in a pure atmosphere the beneficial species of organisms predominate. While it is not possible, in the ordinary course of milking to obtain germ-free or sterile milk, it is always feasible to produce milk absolutely free from non-bacterial taints. This is effected by keeping the byre and dairy free from odours and the utensils used in connection with the milk scrupulously clean.

Many faults and defects in butter and cheese are due to some slight error in the process of manufacture, but a great many defects in dairy produce are the result of the milk in the first instance being badly contaminated with the obnoxious species of organisms. Butter having a stale, musty taste or smell can be traced to the cow byre, and the contamination of milk from the surroundings. Butter of this description generally contains very large numbers of bacteria of various species, the chief of which is the gas-producing organism, which germs always exist in the dung of all animals. There is also a mould characteristic of dung which causes butter to have a stale, musty flavour. It will thus be observed that a great deal of trouble with milk and its products is caused by milking which is conducted in an uncleanly manner, or by careless treatment of the milk causing it to become contaminated.

Handling Rock Phosphate.

Rock-phosphate should not be allowed to ferment with manure in piles. Experiments just completed by W. E. Tottingham and C. Hoffman of the Agricultural Experiment Station of the University of Wisconsin show that under these conditions 40 to 50 per cent of the phosphoric acid which is soluble in water and hence valuable to crops may become insoluble. This is due to the requirements for phosphorus of rapidly multiplying bacteria in the manure heap. This does not mean that the phosphoric acid used by the bacteria will not eventually reach the crops, but before this can occur, the cells of the bacteria must be more or less decomposed. This is a process requiring time as does the formation of humus in the soil.

Rock-phosphate itself is quite insoluble and to be of value to crops must be attacked by carbonic acid which can best be formed in the soil by the rapid decay of organic matter. Hence rock-phosphate gives its best results when applied to the soil with manure. Rock-phosphate and manure mixtures can be applied to the soil through the winter months with economy as the cold weather prevents fermentation. It should not be allowed to stand in piles of manure where fermentation may take place even in the coldest months.

Decomposition of manure in the soil is due principally to bacteria and while the process furnishes carbonic acid which will assist in dissolving the phosphate, the bacteria also use a portion of this phosphoric acid and apparently for this reason floats give comparatively slow returns in practice. An application of floats generally shows greatest effects in the years following the one in which the fertilizer was applied. This indicates that the bacteria must decay and their phosphoric acid be taken up by growing crops before the floats become effective.
